Another idea of the enterprising manager is that of having a special rate for repairs also, in order to do away with the common practice of promising every one to have a job done "right away" and then keeping the patron waiting an extra week. Mr. Gallaher proposes to have his scale of prices for regular repairs, which will be attended to in their order. Repair jobs taken at the regular rates will not be promised "right away," but for those who are in a hurry there will be accommodation in the way of a "rush order" list. Those who want their work done at once and are willing to pay for it will be put on the rush list, and such jobs will take precedence over everything else in the place. For rush jobs an added charge of 25 per cent on the face of the bill will be made.

Regarding Future Reliability Tests.

Expressions of opinion have been asked from its members by the National Association of Automobile Manufacturers regarding future automobile tests.

French and British tests of the last year are touched upon at length, and the system of marking used in the latter quoted. The Motor World is also laid under contribution, the interview with a well known automobilist criticising the recent reliability contest and comparing it with the British event, to the advantage of the latter, and suggesting that every stop be penalized, are reproduced. Proceeding, the following list of questions is propounded by the association:

First—If 100 points be allowed as the maximum for absolute perfection, how many points do you think should be given for each of the features, named in alphabetical order, as follows: Appearance; comfort; condition of car at end of test; cooling system; gasolene consumption; hill climbing; noiselessness; power and weight; reliability; safety (steering mechanism and brakes); simplicity in handling, and speed?

Second—What other features, if any, should receive points, and how many points for each such feature?

Third—(A) Should the contest be over a long course or a short one of, say, 100 miles? (B) If you favor the former, would you support the proposal that there be a run from New York to Chicago about October, 1903?

Fourth—Or do you recommend a test lasting several days, where the machines could run from a central point and back each day in preference to a long distance run?

Features of Vanderbilt's New Coupe.

Something new for New York in the line of private motor carriages has just been imported by W. K. Vanderbilt, jr. It is one of the Mors coupés, and presents a striking contrast to anything of the sort hitherto seen here. It has the long, tapered hood of the racing car in front, finished in red and black, as is the whole car. From the step on the mud guard one reaches a front platform on the right hand side of which is a chauffeur's seat. From the left hand side of the platform the coupé is entered by the only door it has. The passenger compartment is glass inclosed on the sides and front. A main seat for two runs across the back, and there is a little seat for a third person on the front side next to the door. The interior is handsomely upholstered in cream colored velour and corduroy. A flexible speaking tube with gutta percha mouthpieces runs from the inside to the chauffeur's seat, and the end next the chauffeur is fitted with an adjustable whistle of the old style that boys make. The car has a four cylinder engine of 26 horsepower. It is kept with the rest of the Vanderbilt motor string at the garage of Barry & Hayes, at No. 33 West Fifty-eighth street, and altogether is a very stylish looking carriage.

CRYDER HEADS MOYEA

Former Gasmobile Manager Organizes New Company—Has Car and Capital in Hand.

While the Automobile Co. of America is now definitely deceased, its receiver and former general manager, Henry C. Cryder, will continue in the motor vehicle trade as head of the Moyea Automobile Co., which will make its formal bow in Space G at the New York show.

The company was quietly organized this week with a capital of $100,000. It will locate, probably, in Middletown, Conn., but this is not yet definitely settled. Sidney Dillon Ripley and several other of the wealthy stockholders in the Automobile Co. of America are identified with and are financing the new Moyea Co.

Its car will be styled the Moyea, and will be practically a replica of the Rochet-Schneider, one of which Mr. Cryder has had built in this country, and which has been in commission for some little time.

Recent Incorporations.

Peoria, Ill.—The Scheefer Investment Co., with $12,000 capital; to make motor cars. Corporators—Gustav Scheefer, Hugh Moody and Judson Starr.

Boston, Mass.—Park Square Automobile Station, with $25,000 capital; to make and deal in automobiles. President and treasurer, Thornton Parker, Boston, Mass.

Kalamazoo, Mich.—Michigan Automobile Co., Ltd., with $150,000 capital; to manufacture automobiles. Corporators—Dallas Boudeman, W. E. Upjohn, F. D. Fuller, Charles S. Fuller, M. E. Blood, C. A. Dewing, J. H. Dewing, P. L. Abbey, C. C. Blood, Ira Ransom, A. H. Rockwell, G. Vandekeeke, J. D. Scheell, E. H. Hinkley and H. H. Everard.

To Attend Cup Races.

Indications are to the effect that there will be quite a large party of Americans going abroad next spring or summer to attend the race for the Bennett Cup. Percy Owen, of the Winton company, has already arranged to take with him a party of friends, and says he knows of one or two other parties being formed. It might not be a bad idea for the A. C. A. to get up a club excursion, so that the American visitors might go in a body and by arriving on the scene in force demonstrate the interest in automobiling that there is on this side of the pond.

Dinsmore Named as Delegate.

For the American delegate on the international committee that will have charge of the arrangements and the appointment of officials for the Bennett Cup race, the Automobile Club of America has named Clarence Ray Dinsmore.

The Cup Race and Its Meaning.

If nothing else comes of it, the decision to send an American team to contest for the Bennett Cup next spring has served one good purpose. It has aroused the spirit of emulation, and made American manufacturers enter the field as competitors for international road racing honors. When it is borne in mind that in the past these international road races have been the "trying out" ground for the changes makers contemplated incorporating in their cars, the importance of the move will be seen.

It is odd that the donor of the cup, an American, although not often seen in the country of his nativity, should have had to wait until the fourth year of the competition before seeing America represented among the competitors, especially in view of the conditions of the race. Sight is often lost of the fact that the motives that actuated James Gordon Bennett in offering the trophy bearing his name were patriotic and intended to stimulate the automobile industry everywhere. It was expressly stipulated that each contesting car should be the honest product of the country entering it, the handiwork of its craftsmen, the triumph of its designers. Lock, stock and barrel, or, to be more accurate, from tire to transmission gear, from bonnet to body, from motor to muffler, it was to be entirely of native origin. Not even parts of fittings could be imported. Until the industry of a country had so grown that it could produce every iota of manufactured material that entered into the composition of the car, that particular country was barred from the contest.

At first France alone was able to comply with these drastic conditions. Then Germany joined issues with his old enemy, Gaul, and was followed by that other foe across the channel, the British, no less. Now America takes its place in the ranks. It has reached the time when it could make its declaration of independence and, disdaining help of any kind, enter cars to contest on their merits.

A step like this always marks an epoch. Whether we win or lose—and perhaps even more if we fail to make even a respectable showing—we are in the race to stay. We cannot afford to take our hand from the plough, but must, like England, extract experience from defeat, take the lesson to heart, and eventually turn failure into success.

Relatively a Road of Roses.

"Yo' talk about yo' coons a-havin' trouble."
—Popular song.

"There are others."—Bowery classics.

It is well occasionally to turn a really bad thing over and search for a view that is not quite so bad as the others, even if it cannot be truly called a bright side. Holiday time is a season for optimism, too.

There has been a tremendous lot of bewailing about the persecutions that the automobilist has had to endure and in the main it has been justified by the facts. The wailing and the resentment have been strenuous, but, after all, have the conditions been so terrible as those that have been met with by former innovations similarly radical? On the whole has not the automobile with all the undeniable intrinsic objectionability, its noise and smell and early unreliability, made its way rather easily? The steamboat and the railroad encountered prejudices and hindrances a thousandfold greater than those which have beset the automobile. Yet the motor wagon on the highways is just as radical a departure as either of the other inventions.

Even so recent an innovation as the bicycle had greater opposition than the motor car has met. In the anniversary number of the "Bicycling World," published December 18, in celebration of its twenty-fifth birthday, there is a historical recital of the vicissitudes of the early days in cycling that is calculated to make not only wheelmen, but also automobilists, open their eyes and reckon that by comparison the motor carriage has travelled over a rose strewn road. Eminently respectable taxpayers when they mounted the early bicycles were struck by the whips of coachmen; they had dogs set on them; they were stoned and even shot at; they were arrested on trumped up charges; they were driven first from the sidewalk by one officer and then from the carriage way by another. There seemed to be no place for them on the face of the earth. They were arrested for riding on Sunday. They were arrested for riding at night, and they were arrested for riding in the daytime during certain hours. It was ten years after cycling became popular before the parks and highways were thrown open to the new style of vehicle. Before that wheelmen had to be examined as to ability, licensed and taxed. Tens of thousands of dollars were spent and incessant battle waged for a decade before the rights of wheelmen were recognized.

How has it been with the automobile? Within three or four years after the appearance of the first practical, yet very faulty, motor cars, laws were passed opening all roads and parkways to them. Except in a few places they have not had to submit to license tax. The worst they have had to encounter has been persecutions because of speed by country constables, and in a measure this has been a retribution brought upon all by the recklessness of a few.

All things considered, the road of the automobile has not been unnaturally hard. Comparatively, it has been welcomed with open arms. "The world do move." The prospect brightens and, entering a new year, there is cause to rejoice that matters are as well as they are and promising of better days.

The Paris Show.

One thousand cars on exhibition, valued at upward of $5,000,000; thirty thousand people in attendance in one day! Opened by the President of the republic, for ten days

Digitized by Google

the Mecca of fashionable Paris, thronged with sightseers and buyers, the culmination of a succession of shows of ever increasing brilliancy and eclat! Such was the automobile function in the Grand Palais at the French capital which came to an end two weeks ago.

In 1901, and previously in 1900, it was predicted that the pinnacle of popularity had been reached; that public favor could do no more than it had already done; that the exhibits themselves could show no further advance.

But in each case the pessimistic prophecies proved erroneous, and each succeeding exhibition was pronounced better than the last. The latest show, the one under consideration, has come and gone without the infliction of any prediction of the sort, so certain does it seem that the tide still has far to rise.

As has always been the case, the show afforded much food for reflection. The mechanical features of note, whether shown then for the first time or there seen to have been generally adopted, will naturally take a lot of thinking over. Are they destined to become permanent, or merely of a transitory character, to disappear before another show rolls around? Everything indicates that the former is the case, but there have been such indications in the past, only to prove delusive.

Reviewing briefly the more important developments, they have every appearance of being distinctly good.

The steel frame, wood reinforced, was never anything but a makeshift, a hybrid that could not last. Steel alone can be made to do the work, and a U section is emphatically the one to resist torsional and other strains. The practice of having a secondary frame to carry the motor was always open to objection; and it was only a question of time when a way would be discovered to fasten the engine securely and rigidly to the frame. The way has been found, in the opinion of a number of exhibitors. Carburetter improvements also figure prominently, and the plan of automatically securing a uniform mixture, no matter whether the engine be travelling fast or slow, is so obviously a step in the right direction that it stands a good chance of being generally adopted in spite of the additional complexity necessitated.

As to mechanically operated inlet valves, there seems no reason to doubt their eventual success. Brought out a year ago by the concern that has almost succeeded in Germanizing the French trade, it was apparent that they were still in a minority at the Paris show. But they had made their appearance on dozens of stands, and the inference is almost irresistible that they will yet sweep the boards. Like the automatically operated carburetter, the inlet valve adds more machinery; but it also causes a positive opening of the valve, and that is almost sufficient reason for its being.

In short, we are forced to the conclusion that the Paris novelties this year are fixtures, and not, as has sometimes been the case, fads, ephemeral in their character.

Condensers Must Come.

No single problem confronting the makers and users of steam vehicles exceeds in importance that of carrying sufficient water for runs of reasonable length.

The time honored estimate of, roughly, a gallon of water for each mile travelled still holds good. As a rule, therefore, a car carries a supply of water sufficient to run it about 25 miles, say 25 gallons. Occasionally extra large tanks are fitted, sometimes having a capacity of 50 gallons, thus giving a radius of action that is at least reasonable. But tanks of this size take up much room, and when filled with water considerable weight is added to the vehicle. Altogether, this method of grappling with the problem has many disadvantages.

Condensers offer an almost ideal solution, as is well known, and the wonder is that they have not been used extensively in this country.

There are, of course, disadvantages connected with their use—extra cost, added complexity, the difficulty of effecting a separation of the oil and water. As long as there was no urgent demand for a device of the kind these drawbacks could be counted upon to turn the scale against them. Similarly, when it becomes plain that condensers must be fitted to thoroughly first class steam cars, ways and means of doing so will be devised.

In the British market the use of condensers is virtually compulsory, visible exhausts being illegal. Confronted with this condition, it is always met by the employment of condensers.

In the rehabilitation of the steam car, its evolution from an underweighted, underpowered, poorly constructed piece of mechanism to one adequate to all demands made upon it—a rehabilitation that has been going on for a couple of years— the condenser must play an important part. In this case, willful waste makes woful want, and users will not go on indefinitely pouring water into tanks only to have it passed out as useless exhaust. It can be utilized again, and this will eventually be done.

If the near future does not see the adoption of condensers by more than one concern, we shall be very much surprised.

Beware that Sprinkling Law!

Now that the holidays have passed and the Board of Aldermen are meeting again it will be well for the automobilists and other organized bodies which are interested to remember that there is in the hands of the very honorable body a very obnoxious ordinance relative to street sprinkling. This is the bill drawn by Alderman Marks, empowering the several borough presidents to make new contracts with the author of the present sprinkling nuisance, the Street Sprinkling Association. If passed this ordinance would do nothing more than to widen the sphere of the present contractor's vile and dangerous work.

It is impossible to believe that if this sweet scented piece of "legislation" for the benefit of a corporation that has been an offender for ten years is enacted by the "honorable body" Mayor Low will sign it. Yet the Mayor is a busy man, and, although the jobbery in the bill is palpable to those familiar with the situation, it behooves the representatives of the automobile, driving and cycling organization who do not enjoy slimy and slippery asphalt to see that he is acquainted with the facts of the situation.

Now is the time to act in this matter, for the bill is apt to be in the hands of the Mayor for signature within a few days. It was made a special order of business for last Monday's meeting of the board, but did not come up. It is apt, therefore, to be brought up at the next meeting of the aldermen, which will be held on Tuesday, January 13.

Senator Cocks—he who was the first Long Island autophobe, and who was defeated for re-election last November—has issued his valedictory. It is, of course, a defence of the disgraceful law bearing his name and of the deluge of anti-automobile legislation that followed in its wake.

Now is the time for the exhibitors at the Paris show to come forward and tell us how many cars they disposed of. One concern makes the modest claim of 2,000. Next!

Commentary

Not to pat my own back, but I can truthfully say that the remarks I have recently made regarding the state of affairs existing in the National Association of Automobile Manufacturers has caused not only a flutter in that dovecote, but have also caused a "divil of a thinking" in other directions—for example, on the part of at least some of the associate members. Although the outside world may not know it, they outnumber the active about two to one, and as one of them remarked to me last week, about the only privilege they receive is the privilege of paying $15 a year. He admitted that he had a prettily nickelled sign and had been requested to advertise the organization by adding to all his advertisements and printed matter the highly important fact that he was a member of the N. A. A. M., but some way or other he did not appear to think that that was $15 worth or that the associates were receiving their due. He acknowledged that he was being flooded with circular letters—advance copies of which are mailed to reporters who "push along" the secretary—asking a multiplicity of questions which he had neither time nor inclination to heed, and altogether conveyed the impression that he thought that associate members were entitled to attend meetings, share in the councils and make themselves heard or felt, even if they were not permitted to vote. It is not for me to say that the man was reasonable or unreasonable. I simply repeat his disgruntlement because it appears to show a direction in which the wind may blow.

* * *

And talking about the automobile manufacturers' association, you may recall what I told you would likely happen to the show as a result of that indorsement of an alleged "automobile daily" in which the I-am of the association betrays such a suspiciously holy interest. Well, as the date of the show approaches, let me add that unless there is "something doing" for the legitimate New York dailies the snubbing of the show that I predicted will be something to remember. Never mind what I know, but take my word for it, the editors and business managers are "wise," and unless a great change comes over the spirit of their dreams the trade will pay dearly for permitting itself to be "jollied" by a clever, wine opening foreigner, aided and abetted by the I-am in question. By the by, I hear that the foreigner, as "a token of regard and esteem," has presented the I-am with one of his office rubber stamps. I certainly can vouch for it that "puffs" of the I-am's car have been sent to the press bearing the rubber stamp of the foreigner's paper.

* * *

In this connection I am also in position to say that the I-am, having placed his "appropriation" with his great and good friend, the automobile daily, has a great scheme for getting advertising in the legitimate dailies during the show without paying for it. He has engaged one of the New York newspaper men as his "press agent" for the week. The duty of the press agent, a clever fellow, will be, of course, to send cleverly veiled stuff to the dailies, and if the dailies are not on their guard they will be "landed" good and hard. The I-am, I understand, first tried to hire the press agent of the show to sandwich his masked ads. in the show matter which he sends out, but to the credit of the p. a., be it said, he declined with several thanks.

* * *

Unless all signs fail there are going to be not a few heartburnings over who shall be chosen to represent America in the forthcoming contest for the James Gordon Bennett Cup. Furthermore, before the affair is finally disposed of there is most certainly going to be considerable very plain talking indulged in, during which some inside facts will be made public, which, however interesting they may be as showing the why and wherefore of certain things, will not tend to increase the public's already very poor opinion of how automobile racing matters are not managed in this country.

* * *

Upon my calendar I find this memo: "About this time look out for Edison interview." You see, I knew when I wrote that a year ago the thing was due to make its appearance at certain intervals, and always just about show time, hence this memo. of mine. True to precedent, Sunday's papers had the interview, and in it Mr. Edison announced that his great New Year's gift to the world was to be—the storage battery on which he has worked night and day for four years. Of this wonder Mr. Edison is quoted as saying:

"My storage battery is now ready for the market. We have begun to make them for sale, and they will be offered on the market soon after the New Year. I've tried them on three runabouts here for several months, and one of our machines had done as high as eighty-six miles on one charge. Oh, it isn't perfect yet; you know we never get those things exactly perfect, but it works, and anybody can handle it. It solves the traction problem."

The more you think of it the more you will be convinced that the year 1903, despite the ill omen of its total of thirteen, is going to be a great one if for no other reason than that it is to be the one in which this great battery is to be placed upon the market—perhaps.

* * *

A gentleman rejoicing in the name of Obendorfer, and by profession a theatrical treasurer, has just applied to the New York bankruptcy courts for relief from $3,906 of indebtedness, to meet which he has neither assets nor regrets. One-half of the amount of the gentleman's debts is for money borrowed, while almost 10 per cent, or, to be exact, $189, of the remainder is "for repairs to an automobile." There is a moral here somewhere if I had time to dig it out, but as I haven't, suppose you do so.

* * *

In connection with that little leaf turning experiment of a week ago, it is well to remember that the road which is paved with good intentions generally has a disinterested friend at every corner of it.

* * *

He's still at it. The "great" cartoonist to whose kindly consideration of the automobile I referred last week has followed his former libel with another. This time the alleged drawing is entitled, "The whiskey procession—where are you?" In this magnificent drawing first comes an automobile with a bewhiskered chauffeur labelled "The Distiller"; then an open landau with a smooth faced, preacher looking chap ticketed "The Wholesaler"; following comes a light side bar, sporty looking, trotter drawn buggy with a driver who wears a liverpad lettered "The Retailer." In the background are a lot of lunatics, hoboes, jailbirds, etc., bearing a banner upon which is blazoned "The Consumers." In the printed matter which always has to accompany the great works of art drawn by this artist, so those who see the drawings may know what they are, the cartoonist says: "The man who manufactures whiskey has his fast automobile. . . . Where is the automobile of the confirmed whiskey consumer? . . . If you are able to ride in this procession in the automobile, the carriage or the buggy, we have nothing to say." I wonder what it's all about?

* * *

A great many people who will never enter a race or indulge in a tour further than ten miles from home and one mile from a repair shop have wasted a lot of time thinking about what might happen if they ever did.

* * *

Chickens come home to roost, at least, those who understand chicken etiquette say that they do. Perhaps the French automobile chickens are seeking roosting privileges at their home station, because after we have heard so much about how all the world has stolen the Frenchman's ideas of how to make a first-class automobile, see what happens. A German concern—it couldn't be worse than that, you know—makers of the most famous automobiles in the world, and one which hasn't a single French idea in its construction, refuses to exhibit any of their new models at the automobile show in Paris, because, as the German so naively puts it, "of the way German ideas are annexed by French automobile makers"! Is it in the power of any one to have given French pride a blow which it would feel as severely as this German one? I do not believe so.

THE COMMENTATOR.

Digitized by Google

GASMOBILE IS OUT.

(Continued from 361.)

on the New Haven road which we have in view.

"James E. Woodbridge, formerly with the Pratt & Whitney Co., Hartford, Conn., will we the vice-president and general manager of the Pan-American Co. Designer and Consulting Engineer Power has just returned from the Paris show, where he went to examine the newest cars and to purchase parts and materials that cannot be obtained here. In the new factory the work of producing Pan-American cars will be prosecuted vigorously and on a large scale.

"There is no change of name, no consolidation or absorption. Beyond the purchase of certain goods by the Pan-American company from the Automobile Co. of America there is absolutely no connection between the two concerns."

Ever since the ill fated Automobile Co. of America went into the hands of a receiver, about a year ago, there has been much speculation as to its future. It was stated with the greatest positiveness by those interested that it would be reorganized and resume the manufacture of cars—either the Gasmobile or others. The Rochet-Schneider was most prominently mentioned as one of the "others," and within a very few days it was asserted by those who ought to know that this would be done, everything being ready to go ahead on them. Within a week or two, also, rumors of dissensions among the stockholders became peculiarly persistent.

To set the matter at rest the Motor World representative asked and obtained an authoritative statement of the matter from a gentleman closely identified with such heavy stockholders of the Automobile Co. of America as V. Everit Macy and Sidney Dillon Ripley, and who was an officer of the company at the time the receiver took charge.

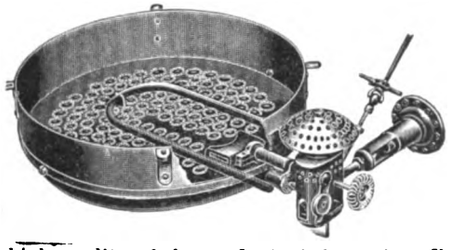
"Mr. Chamberlin's statement is correct," he said. "As to the Automobile company, it means that it will be closed up entirely. All idea of manufacturing will be given up. You may state this positively."

It was also learned from an equally authentic source that some of the stockholders of the Automobile Co. of America have acquired interests in the Pan-American company.

A statement showing the condition of the affairs of the Automobile Co. of America has been filed in the Chancery Chamber at Newark, N. J. It shows that the profit and loss account foots up to the sum of $18,166 22. Among other items contained in the report are the following:

CLAIMS DISALLOWED.

Paul N. Turner	$12,500 00
Charles C. West	5,000 00
John H. Flagler	17,069 34
American Motor Co.	2,475 63
Jos. Yolden (as a preferred claim)	2,900 00

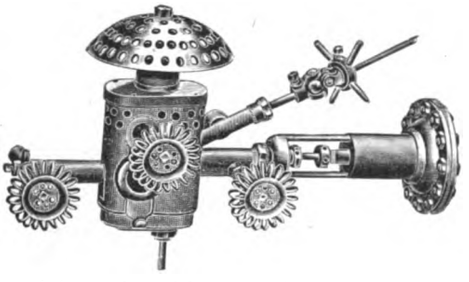


ASSETS.

Property sold by receiver	123,545 48
Paid out by receiver	142,061 70
Loss from sales of assets	115,925 15
Paid by receiver to creditors	105,747 77
Property and assets of the company sold at auction sale	10,000 00
Debts collected by receiver	6,888 44
Profit and loss account (loss)	18,166 22
Claims of creditors against the company	244,203 90
Creditors who did not present claims	9,983 89
Inventory of assets at time of appointment	343,229 99

There was also a mortgage of $248,229 99 on the plant of the company.

Forg's Burner and Generator.



Forg automobile fittings have made for themselves a good name wherever they have been used, due to the exceptionally

high quality of the product of the maker, P. Forg, Somerville, Mass.

The three compartment burner and generator, both of which are shown, are excellent specimens of Forg quality.

These burners are of the reversed pattern, and are made with two partitions, thus making a three compartment burner; as each compartment is furnished with a separate

mixing tube, either or all of the compartments can be used at will.

The gasolene supply is carried through a pipe entering on the left hand side and passing over the burner in a O form, out on the right hand side, where it passes into the generator box. The pilot consists of a T shaped casting secured to the top of the burner between the gasolene supply pipe.

In starting up a small quantity of alcohol is burned in the cup provided for this purpose at the bottom of the generator; the heat from this generates gas for the pilot; the supply entering at the bottom, or stem of the T, throws a strong blue flame from each of the upper branches of the T against the gasolene supply pipe; the heat from this blast vaporizes the gasolene as it passes through the pipe; after the pilot has been burning a short time the valves supplying fuel for the burner itself may be opened.

The valve on the left injects into the left hand compartment, that on the right into the right hand compartment; the injector for the pilot, which it is intended should passes up to the seat and which also controls the entire supply of fuel, except that for the pilot which it is intended should burn at all times, and which can be shut off by the valve at the centre of the generator box. The rod passing up to the seat is provided, at the swivelled point, with a wheel, and can therefore be operated at this point without reaching up to the seat.

The generator box is made of sheet steel suitably perforated and so arranged that, while the fire will burn freely inside of the box, it will not blaze up on the outside, as in the case with generators of other manufacture. A suitable bracket is provided for use in attaching these generators so that they may be rigidly secured and retained in their proper position.

All connections are made outside of the firebox and at points easy of access.

Buck's Revolving Steam Engine.

What is termed a triple expansion, condensing, revolving steam engine, for use in propelling automobiles and other vehicles, has been invented by Henry A. Buck, of Brooklyn, and is being shown in that city.

Buck's dream has been to discover the means of solving the moast difficult problem of engineering—of saving the tremendous quantity of energy that is lost by steam engines of the most improved type and of applying the power direct.

He has now perfected an engine that he is confident has solved these problems.

The engine itself is described as being so simple that it seems to the layman impossible that it could even be what it is called, but a brief examination of its method suffices. It is a cylinder—a mere steel shell about twelve inches long and twelve inches high.

Through it runs a central shaft. A cross section would show that in the centre of this shaft a steel disk is riveted, and to this disk are attached three metal cylinders upon which the power or steam is applied. These three cylinders make the engine triple expansion, and the surfaces of each, on which the power is applied, are so arranged with series of grooves that an enormous area on which the steam acts is secured and the greatest amount possible of the expansive force in the steam is utilized.

The engine has no dead centre, no pistons, piston rings or rods, no steam chest valve, valve rods, eccentrics, cams, link motions, sliding parts, reciprocating parts or any of these things common to the accepted type of engines. It receives its steam at the highest temperature possible, and exhausts it at 40 degrees lower than any other engine now in use.

A 100 horsepower engine of this style made of cast iron steel, weighs about 300 pounds; is controlled by an ordinary governor, can be operated or placed in any possible position, even if inverted and bolted to the ceiling or against the wall, or horizontally or perpendicularly, running absolutely without vibration, can be instantly and smoothly started, stopped or reversed.

FAMOUS FRENCHMEN COMING

Not Only Fournier but Others Due—Stories of French Trade Tricks Precede Them.

The news that Fournier is on his way here and that he has managed to secure space at the New York show has caused something more than passing interest in some quarters, because it was supposed that Fournier and the line of cars that he handles were to be represented in this country by a New York concern.

Fournier cabled to the managers of the show for space some time ago, and was answered that there was none to be had. It was his intention then to come over here and do business on his own account during the show. After being refused space it was reported from Paris that he had closed a deal whereby he would have representatives in this country, and that part of the Fournier exhibit at the Paris show would be shown here by his agents. Under these circumstances it would seem something beyond unnecessary for Fournier to take space as he has done and bring over cars himself, as it is reported he is doing, and a few are speculating as to his object.

Fournier obtained Space N in the restaurant of Madison Square Garden in a peculiar way. W. H. Webster, of the Webster Automobile Co., 10 West Sixtieth street, had taken Space N, but he found that the new car he wanted to exhibit would not be ready in time for the show, and having heard of Fournier's disappointment, he cabled to the Frenchman an offer to sell his space. Fournier accepted promptly, and he sailed for New York last Saturday on La Bretagne, accompanied by his business associate, M. Rabourdan. On this Saturday's French steamer will be M. Charley, the Mercedes agent; M. Clement, the automobile and motor cycle maker; M. Neubauer, M. A. Lamberjack, M. Lucas and M. Bertrand, the last three of whom have been identified with racing events.

In connection with the unexpected action of Fournier in engaging space at the show after having given an agency, some of the methods of the French makers and dealers, as commented upon by some of the Americans who visited the Paris show are interesting. Commercial practices are told about that are, to say the least, complicated. A man who wanted to place an order for some machines said he found it impossible to deal with the manufacturers, but that he could nevertheless get what he wanted if he went to some agent who was named by the maker. The partiality shown by makers for certain of their agents against all others, is most extraordinary if the makers have no interest in the agents' establishments, says this man. He tels how he went to a manufacturer ready to put down cash with an order, was refused, and when he remarked that he would go to the manufacturer's agent "A," the maker hastily advised him not to go to that one, but to "B," where he would get a better choice of deliveries.

Another intricate style of dealing that hardly would be indulged in by any reputable American concern is related by another American buyer who went to a French concern to place an order. They told him that they could not sell him machines for export because they had given an exclusive agency for the United States. When he seemed about to give up the quest, the dealer, after having learned that it was to be a "ready money" transaction, detained him and explained that he might be able to sell him if he would take 'Paris delivery," but that he could not sell them to a man in the United States. So it was arranged that the goods should be billed and delivered to the American's agents in Paris, who in this case were his bankers, and the deal was closed, and the scruples of the dealer against violating his contract with his agents were overcome.

An experience related by another buyer in the French market is that he went to a dealer to get a lot of parts and emphasized the fact that he wanted the latest things, as no others would be of any use to him. When he got the goods here he found, he says, that they were stock a couple of years old and useless to him.

Foreign Courses in Doubt.

What closely approaches a deadlock exists in regard to the course of the Bennett Cup race. In refusing to accept the Irish route the French Automobile Club betrayed its desire to have the race take place in France. The British club is equally desirous of running it in the United Kingdom, and neither organization is disposed to give way. The selection lies with the British club, but it must conform strictly to the rules unless the challenging clubs waives them. A decision must be reached by February.

Meanwhile preparations for the Paris-Madrid race grow apace. The announcement comes from Madrid that a decree has been signed authorizing the race on Spanish territory. French autoists are disposed to fear that in France the necessary authorization may not come easily, although there is no doubt it will be obtained in due time.

Railroad Rates to the Show.

With the exception of those of the New England and Pacific Coast States all the railroads have now granted reduced fares, viz., a rate of one and one-third, to the Good Roads Convention to be held at Chicago on February 14 to 21, during the automobile show. The Western Passenger Association and the Trunk Line Association last week followed the lead of the Central Passenger Association in granting special rates.

FEW MERCEDES CHANGES

Although not Shown at Paris That Famous Car Said to Embody Nothing new for 1903.

Since most of the French makers have copied the 1902 Mercedes for their 1903 models, the question of what the Mercedes people are doing for 1903 naturally has become a burning one. At the Paris show only 1902 models of the famous German car were shown, and so far as had been revealed no one knew what the Mercedes people might have "up the sleeve" for this year.

It certainly would have been amusing if after all the efforts at imitation of the "noiseless model." even to the square nosed front bonnet, honeycomb radiator and body lines, the makers of the pattern should have departed from that model and brought out for 1903 something entirely new that would prove itself to be still a year ahead of its imitators.

The Mercedes people are conservative, however, and not the sort that change for the sake of change, so there is nothing revolutionary about their model for 1903. From L. G. Herz, who until a couple of months ago was one of the employes of the Mercedes plant, something of what the German firm is doing has been learned. The new machines will have a four cylinder engine of 60 indicated horsepower, but capable of developing 70 on the brake. Their speed clutches will permit of a shift direct from the low to high, and there will be new features in connection with the sparking system and carburetter. The chassis is built lower and the radiator system is retained with the same style of front bonnet. The firm will build only racing cars, and will make about 400 of them, all of which have been contracted for. Last year the product of the factory, according to Herz, was 250 machines. Herz says that when he left the new speed clutches were not working properly, but that they would undoubtedly be perfected before the first car is delivered, which, he thought, would not be before April.

Openings in Brazil.

In Buenos Ayres a large number of rich traders and planters are eager to purchase motor vehicles at the first opportunity. A French traveller arrived a few months since with a number of cars and invited the President and other notables for a tour through the neighboring country. Each car found a purchaser; other would-be motorists had to be satisfied with placing orders, and these eagerly await the arrival of the vihicles. Several planters in the interior visit their ranches and plantations in automobiles, and all find them extremely satisfactory.

Demonstrating the Dynamo.

A novel demonstration which is certain to prove interesting at the show, where it will be on exhibition at the spaces of Charles E. Miller, is now to be seen at Miller's wonderfully variegated showrooms at No. 97 Reade street. It is an optical exploitation of the difference in the spark furnished by a magneto and a dynamo. The demonstration is made very simply. A belt run by an electric motor is connected with both a magneto and an Apple dynamo, so that each is operated at exactly the same rate of speed in order to make a fair comparison, such as would be afforded by a car in operation. The illustration shows a much fatter spark to be given by the dynamo, of course, but the way this is shown is one that is more convincing than a volume of argument. The whole story is in a simple, "See for yourself."

Bidding for Show Visitors.

Nearly every man who travels knows "the Yates Syracuse."

It stands for all that a good hotel should be. There is an atmosphere of comfort and freedom about it that appeals—a sort of satisfying whole that makes the men away from home wish there were more hotels like it.

Therefore, it will be welcome news that there is added one more like it, and that in New York City, convenient to Madison Square Garden.

The Gregorian is the name, and it is located on Thirty-fifth street, between Fifth and Sixth avenues, and just off Broadway.

It is a handsome new structure, thoroughly modern and fireproof, and will be automobile headquarters for a large delegation during the New York show.

It is under the management of Averill & Gregory, of the Yates, and their promise to take care of autoists means much.

Accommodations can be reserved by writing the Gregorian in advance.

Many Uses of Gasolene.

Gasolene is not alone valuable for propelling an automobile. In a dozen other ways it is little short of indispensable to users of cars and their mecanicians, as well as in the repair shop.

It acts like magic in removing gummed oil from engine parts, such as valves, piston rings, etc. It is infinitely superior to kerosene for such purposes, as it leaves no deposit. As a rubber solvent it is equally efficacious. It comes out strong as a cleanser, removing grease stains from the hands in double quick time.

Scarritt will be Toastmaster.

A meeting of the entertainment committee of the N. A. A. M. was held on Monday evening to arrange details for the annual dinner, which is to be held at the Waldorf-Astoria on January 23. Winthrop E. Scarritt was agreed upon for toastmaster, and a partial list of speakers was agreed upon, as follows. F. S. Fish, John S. Wise, F. Smith and A. R. Shattuck.

Harkness Names Fournier and Vanderbilt.

"There's a lot of knack in driving a car, and especially a racing car, well," remarked H. S. Harkness to the Motor World man not long ago.

"But for skill of the first order there's nothing like that displayed by the man who makes speed changes while going at a fast clip. He has got to know instinctively or by intuition just when to make the shift. Most of us learn in time to do this pretty well, but there is always an infinitesimal period of time during which we hesitate before shoving the lever into place.

"There are two men, however, who rise superior to this weakness, this indecision. I refer to Henry Fournier and W. K. Vanderbilt, jr. With them the change from one speed to another is, or seems to be, a small matter, made with unconcern and decision and without the slightest hint of hesitation. As soon as the brain foresees the necessity for a change the hand makes it. It is never done bunglingly, either. Perhaps some day the rest of us will acquire this knack, but we haven't got it yet."

Club in the Crescent City.

A score of Crescent City automobilists met last week and organized the Automobile Club of New Orleans, the first distinctly Southern club in the country.

The election of officers resulted as follows: Albert Mackie, president; Theodore Grunewald, vice-president; Sam Stone, jr., secretary, and E. H. McFall, treasurer.

It was agreed that the meeting should select the chairman of the several standing committees, and that the president should name the members later, thus giving him an opportunity to perhaps name some who were not present. The following were chosen: Committee on laws and ordinances, Hewes T. Gurley, chairman; membership, Ginder Abbott, chairman; good roads, Charles U. Kennedy, chairman; runs and tours, C. S. Burt, chairman; racing, Palmer Abbott; house and clubrooms, A. J. Nelson, chairman. Board of governors to be composed of the chairmen of the several committees.

Three Napiers Will Defend Cup.

Several weeks ago comment was made in these columns on the severity of the requirements imposed upon British makers who contemplated competing for a place on the Bennett Cup team. The deposit of $2,500 was required as a preliminary.

It transpires that the criticism has been justified by the event. Although a number of British makers announced their intention of competing, none of them came to the scratch with the necessary deposit. Consequently a third Napier car has been added to the two already selected, and the British team will consist of these cars exclusively.

The German team will probably be made up of three Mercedes cars, while France will have two Panhards and a Mors. Only one of America's team, a Winton, has yet been decided upon.

What Surprises Shattuck.

"I have been surprised and considerably annoyed at the lack of interest in the Brownlow Good Roads bill, now before Congress, displayed by some of the automobile journals," said President Shattuck of the Automobile Club of America to the Motor World representative on Monday.

"They go on showing patent specifications and describing obsolete automobiles, but they have no space to devote to an important matter like this Brownlow bill," he went on with some heat. "From the technical press we expected something better than this.

"The importance of good roads to all users of the automobile cannot be exaggerated. For that reason every effort should be made to further the cause championed by the Brownlow bill. Every possible influence should be brought to bear to insure its passage."

Why the Mechanical Inlet?

There is one point about the mechanically operated inlet valve that is sometimes overlooked, in spite of the fact that it is very important and, indeed, one of the chief causes of the adoption of this feature. It is obvious that as the engine slows down the force of the suction will decrease, until it will sometimes be insufficient to open the valve, thus causing the engine to stop. With a cam opened valve, however, it makes no difference how slow the engine may be running. The valve is opened and the mixture sucked in, whether the speed be 100 or 1,200 revolutions. That crying need of the gasolene engine, flexibility, is thus obtained in some degree.

For Good Roads.

A bill has been prepared and will be introduced in the Pennsylvania legislature designed to bring about an improvement of the roads of that State.

The bill provides for the creation of a State Highway Commission, to consist of three persons, who shall be authorized to appoint a State highway engineer. These, working with the county commissioners, will attend to the construction of roads. The expense is to be divided equally between the State, county and township. The bill provides for a State appropriation of $6,000,000, $1,000,000 of which is to be used annually.

French Farmers Welcome the Speed Trials.

At the earnest request of the villagers the French officials have lifted the interdict placed on record breaking on the Dourdan road near Paris. Instead of being unwelcome visitors, the speeding automobilists are welcomed with open arms, and no one regretted their banishment more than the country people in the vicinity. This being so, they requested that the ban be raised, which was done. Now record breaking is permitted three days in the week.

SPEED RATE COMPROMISE

Ask Aldermen to Legalize Eight Miles in City, Fifteen in Suburbs.

With unexpected celerity and without warning of any kind the entire aspect of the speed controversy in this city has been changed. The proposed amendment to the local ordinance increasing the rate from eight to ten miles an hour within the city limits will not be pushed before the Board of Aldermen. In its place an amendment will be offered keeping the eight mile limit in the greater part of the city, but permitting a speed of fifteen miles an hour in the northern suburbs of Manhattan and The Bronx and in the unbuiltup portions of the other boroughs. In this shape it is anticipated that the measure will go through with a hurrah.

The new regulations are embodied in the appended resolution, passed by a sub-committee of the so-called Committee of Fifty:

Whereas, The Automobile Club of America has submitted to this committee an amendment to the proposed ordinance relative to the speed of vehicles in the city of New York, the adoption of which amendment said club is prepared to advocate, provided this committee and the Committee of Fifty do not oppose the same; said amendment being in the following form:

Section 1. Speed of Vehicles: The following rates of speed through the streets of the city shall not be exceeded: That is, eight miles an hour by bicycles, tricycles, velocipedes, motor vehicles, however propelled, other than streetcars, or by passenger and pleasure vehicles drawn by horses or other animals, except that, in the Borough of Manhattan, on Broadway, north of One Hundred and Eighty-first street, on the Boulevard Lafayette and on Washington avenue, and in the boroughs of Brooklyn, Queens, Bronx and Richmond, upon streets where the buildings are at least one hundred feet apart, a speed of fifteen miles an hour may be maintained.

Sec. 2. No person riding, driving or in charge of any vehicle on any street, avenue, parkway or driveway in the city shall drive the same at any speed greater than is reasonable and proper, having regard to the traffic and use of the highways, or so as to endanger the life or limb of any person; and,

Whereas, This committee, after discussing the provisions of said amendment, has concluded that the adoption thereof and its inclusion in the proposed ordinance, will substantially accomplish the result to attain which the Committee of Fifty was formed, and will provide adequate and reasonable safeguards for passengers and vehicles in the congested streets of New York City; therefore,

Resolved, That this committee approves of said amendment and recommends to the full Committee of Fifty its approval thereof, to the end that said amendment may be adopted, and the object of said committee's work accomplished.

To a Motor World man Secretary Parker of the committee stated that at an informal meeting between Messrs. A. R. Shattuck and W. W. Niles, of the Automobile Club of America, and three members of the Committee of Fifty, held last week, the matter was talked over and the foregoing resolutions agreed upon.

"Under the terms of these resolutions," said he, "the Committee of Fifty obtains all it has fought for. It is perfectly satisfied, having achieved the object which led to its formation. We shall probably retire, now that this has been accomplished."

President Shattuck was then sought, and asked if the Automobile Club's attitude was correctly stated.

"Yes, we have agreed not to press the ten-mile an hour amendment," he said. "We thought the matter over very carefully, and came to the conclusion that such a compromise as has been reached was the wisest course. It was doubtful whether we could have won our fight on the original lines, and it seemed to us that it was better to secure a fifteen-mile rate in the suburbs than to stand or fall by ten miles everywhere.

"As it is, we get a fifteen-mile rate on upper Broadway, Lafayette Boulevard, the Hoffman Boulevard and other frequented roads. This more than offsets, it seems to me, the failure to obtain a ten-mile rate in the city proper."

No little surprise has been caused by the sudden right about face. As was stated in these columns a few weeks ago, there was every reason to believe that the 10-mile amendment would be adopted finally. Alderman Joseph Oatman took this view of the matter on Monday, when he said to the Motor World man:

"There was a very good chance of putting the amendment through as it stood. Now that the Committee of Fifty has withdrawn its oppposition, and an agreement has been reached by all concerned, there is not the slightest doubt of the passage of this latest amendment."

Correct Your Records Accordingly.

Fresh investigation having shown the following records to be the best in their respective classes, they are given in place of those contained in the table which appeared in the Motor World December 4. In the steam car class, competition, the records for one to three miles, inclusive, stand in the name of W. C. Buckman. At Detroit, Mich., on October 25, 1902, he won a three-mile race, his time for the distance being 1:34, 2:51 and 4:07 2-5, respectively. This supplants the one-mile time of Griffin, made in 1900. The electric care time, competition for five miles, belongs to A. L. Riker, who covered the distance in 8:47 4-5, at Brookline, Mass., on June 15, 1901. The ten-mile record credited to Rollin White, in the gasolene class, under 1,000 pounds, is an error.

KIMBALL COMES BACK

Returns From Paris With a Fund of Interesting Views of Foreign Cars and Affairs.

Among those who have recently returned from European trips with interesting views about what is being done abroad, is E. T. Kimball, of the Central Automobile Company, 1684 Broadway, New York. He arrived on the Philadelphia last week, with his wholesome countenance denoting excellent health and spirits.

Concerning the situation in France at show time, Mr. Kimball says that it was a poor time to do business, and that he never would go over for that purpose again at show time. They were all "up in the air," inflated with highly inflammable gas, which was the product of their notions as to the importance of the French industry and the demand that all the world was going to make upon it. Their ideas were altogether too large to admit of practical business deals, thought Mr. Kimball. He says getting an exclusive agency at this time is out of the question, but he did close a contract for Mors and Renault cars, which his company will handle this year in addition to the Peugeot. The Mors cars he expects to have here ready for delivery in March, but two models will be on hand for the New York show. These will be an eleven horse power car complete and the chassis of an eighteen horse power, which are the new types of Mors this year.

With regard to the exhibits at the show, Mr. Kimball expressed some interesting opinions on the cars. The Mercedes, he declares, is a superb car, developed to the utmost point of serviceability for a thoroughbred automobilist. It is hardly the car though for the ordinary man who is not expert, because it has been developed beyond the stage of simplicity, and there is a great deal that must be looked after to keep it in perfect order. The Mors, he thought, presented a better proposition for the average man. It combines high efficiency with simplicity, and is best calculated to give all around satisfaction. The Panhard, in his opinion, seemed to be rather at a standstill. It showed fewer improvements than others and no advance in individuality. The Renault is taking a stronger hold than ever on the public and is bound to sell well. The new models are thoroughly developed, splendidly finished and furnished in enough variety of styles, one, two and four cylinders, to satisfy any demand. The Renault factory is being enlarged, so as to increase the capacity from 900 to 1,200 machines. The Mors output, according to Mr. Kimball, is about 250 or 300, and the Panhard about 600.

COCKS'S VALEDICTORY

The Defeated Senator Sounds a Parting Blast in Defense of His Infamous Law.

In a long article in a Brooklyn daily, Senator Cocks, the Nassau County (L. I.) legislator, from whose fecund brain issued the malodorous anti-speed law bearing his name, undertakes a defense of himself and his bill. The defense come at an appropriate time. The Senator's career at Albany is ended, he having failed of re-election in November. Hence these regrets.

Digressing for the purpose of urging that something more than a speed limit is necessary to curb automobiles, which are asserted to be "heavy machines of high power capable of developing a speed of fifty or sixty miles"—presumably in one hour—the Long Island sage goes on to say:

"The law regulating the speed of automobiles on highways is a matter of great interest, and has caused considerable discussion since its enactment, and especially since the more rigid enforcement of the law during the past few months.

"From the observation of the driving of automobiles upon our roads during the past season, a great improvement has been noticed in many ways. Whilst occasionally we see a machine going at a very rapid rate, the majority of them do not much exceed the speed limit. Almost all drivers are more considerate than formerly; they blow the horn less frequently, which was always a source of great annoyance, as it indicated by the manner in which it was blown and the frequency of the blasts that the driver of the automobile expected you to give him a free passage on the middle of the road, whereas, as a matter of fact, he had no more right to the highway than the person moving slowly in the vehicle, and one blast, or possibly two, would have been sufficient to warn the person that an automobile was approaching and he would then be compelled by courtesy and by law to give him a portion of the road.

"The first bill passed by the Legislature regulating the use of automobiles on our highways was a very ineffective law, as a violation thereof was not made a criminal offense, hence the only way or prosecuting a violator was by a civil suit.

"In urging the passage of that first law, the automobile people represented that if a speed limit was established by law, the drivers of automobiles, being gentlemen, would respect it, and that in their judgment such a bill as that would be effective. Experience has taught, however, that it is necessary to have a law, the penalty for the violation of which can be readily inflicted, as most of the automobilists failed to respect the provision relative to speed, until it was made a misdemeanor to exceed it.

"All those who have sought to regulate the use of the automobile have realized that it is here to stay, and most of them have no desire to interfere with its proper use, but only expect to so regulate their use upon the highways that they shall not be a menace to the safety of those who travel upon them.

"As to the enforcement of this law on Long Island since it has been taken up actively by the District Attorney and by the various village corporations, it has been sometimes claimed by the automobile owners when arrested, that they were persecuted, and made many excuses which seemed to the average citizen to be ridiculous, but it must be remembered that there had to be some fixed standard beyond which it would be illegal to run the machine, and if a man had exceeded the speed limit by only a few seconds per mile, he, nevertheless, was a violator of the law and therefore subject to arrest. A great majority of the citizens think that the fines imposed by the Justices are utterly inadequate, some having been fined less for the second and third offense than the first, whereas, after the first offense they can be punished by imprisonment at the option of the Justice.

"The difficulty in drafting a law to regulate the use of automobiles on highways will be appreciated by one, only when he begins to draft such a measure. Last winter there was a great many suggestions offered, but it was desired to have as simple a law as possible, so that it could be readily enforced. The automobile people proposed that a different speed might be allowed in certain portions of the country, but after careful deliberation it seemed impossible to draft a law making these provisions without vitiating the whole. Whilst there may be places where it would be safe to run automobiles at a greater speed than twenty miles, it is difficult to incorporate that into law so that it can be enforced without great difficulty. It seems to the average man that twenty miles an hour is a reasonable fast rate to travel over roads which horses and pedestrians use, and that it should be a sufficient speed for all practical purposes. If the automobile people desire a place for speeding, they should build a speedway for that purpose.

"The various accidents that have happened since the passage of this act have justified all claims made by the friends of the measure. Such accidents as the Fair tragedy in France, the one at Yonkers, and countless others, have demonstrated that great care should be given to running the automobiles on highways.

"As to what should be the proper thing to do when automobile meets automobile, we are not discussing now, but it seems to the average driver of the horse that to run those rapidly moving machines past each other as closely as they try to pass a team, would be reckless to say the least.

"The drivers of automobiles must remember that much of the ill feeling that is manifested from time to time is due almost entirely to the utter disregard of the rights of others shown by some of the automobilists, and consequently all have to suffer for the selfishness and discourtesy of the few."

MUST BE DIVIDED

Patent Office Promulgates a Ruling Relating how Motor Vehicles are Dealt With.

In an important decision just handed down by the Commissioner of Patents it is held that a division is "required between claims covering a motor vehicle and claims covering the steam power apparatus for use in a motor vehicle."

The case hinges on the application of Andred H. Tyson, filed May 7, 1902, No. 106,336. On July 30, 1902, the examiner made several minor criticisms of the specifications and the claims, and then said:

"The case covers several distinct and independent inventions, one of which, motor vehicles, is classed in another division of the office.

"Claims 1, 7, 10, 11, 12, 16 and 17 are to a condenser; claims 2, 3, 4, 5, 6, 8, 9 15 and 18 are to a feeder; claims 13 14, 19, 20, 21 and 22 are to a motor vehicle. Division is required to be made before action on the merits."

The applicant appealed from this ruling, and petitioned that it be overruled. It was finally held by the Commissioner, after much argument and legal warfare, that "the examiner is right in his requirement of division between claims, 13, 14, 19, 20, 21 and 22, which cover a motor vehicle construction, and the remaining claims in this case, which do not relate in any way to the construction of a motor vehicle. Motor vehicles are recognized by inventors and manufacturers as a distinct subject matter of invention and sale from the specific engine, boiler or condenser mechanism which may be used in such motor vehicles. This independence of invention has also been recognized by this office in its scheme of classification.

"With regard to the other two groups of claims the examiner is in error in requiring division. These two groups of claims are held by the examiner to cover, respectively, a condenser and a feeder. An examination of these claims discloses the fact that none of them is limited to a specific construction of condenser or a specific construction of feeder. All the claims, with the exception of those held to cover a motor vehicle construction, are drawn to cover combinations and sub-combinations of a general steam power apparatus, and division should only be insisted upon between claims 13, 14, 19 to 22, inclusive, and the remaining claims in the application.

"The petition is granted to the extent indicated."

When Steamers Stand Still.

If users of steam cars ever notice their water gauge at a standstill while under steam they should without delay try the lower check valve to see that it has not become seated. These check valves have above them a small hand wheel, the screwing down of which releases the valve. It is possible for this to happen, and the boiler tubes to get burned in consequence.

Short Circuits

There is an import duty of 30 per cent on cars brought into New Zealand.

There is talk of holding a hill climbing contest at Boston in the spring.

Among the purchasers of Oldsmobiles in this city last week was Harold S. Vanderbilt.

"The Transportation Problem" will be the subject of the evening at a dinner to be given by the City Club on January 12.

Mayor Ashbridge promptly affixed his signature to the ordinance regulating automobile traffic in Philadelphia, and it became a law last week.

Boston autoists are indulging in talk of a local show. Many tradespeople are said to favor one, but no active steps have yet been taken in the matter.

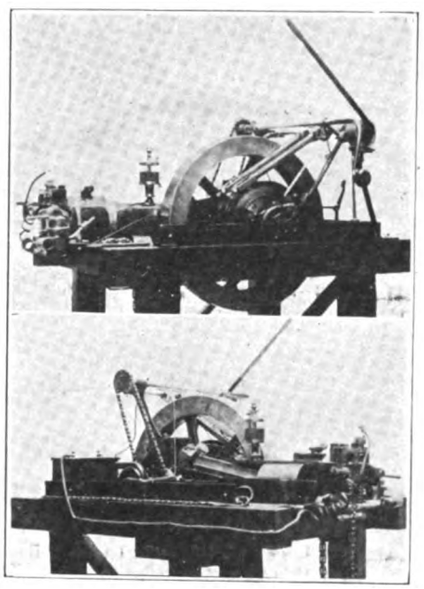
On January 1st E. A. Archibald, the founder of the Archibald Wheel Co., of Lawrence, Mass., retired from the company, which will be continued under the same name.

Members of the Springfield, Mass., Automobile Club will attend the Madison Square Garden show in a body. They will leave Springfield on Tuesday morning, January 20th, for this city.

The thorough good feeling that exists between the Haynes-Apperson Co. and its employes was shown just before Christmas when the latter presented President Edward Haynes a handsome chair.

Direct from W. K. Vanderbilt, jr., himself comes confirmation of the fact that he has entered for the races of the French Automobile Club this summer, and that he will tool a Mors racer in them.

Following are the latest additions made to the membership of the Automobile Club of America: Active, George F. Baker, jr., H. S. Elliott and Henry S. Kerr; associate, Edward H. Butler and C. W. Matheson.



Representative L. H. Johnson, of Minneapolis, Minn., is preparing a bill for presentation to the legislature of that State regulating the speed of automobiles in the country districts. Undue speeding is alleged to be the cause

Few people, even autoists, stop to think that very often the bad odor that accompanies gasolene cars really comes from burned or overheated lubricant. Such is undoubtedly the case, and it increases the difficulty of coping with the matter.

When a man reaches the "what's the use" stage his case is pretty nearly hopeless. Automobiling, at least, has no place for him.

Showing Just how it Works.

A new window display that began immediately to attract was set up a few days ago in the Oldsmobile store at No. 138 West Thirty-eighth street, presided over by R. M. Owen. It was a new model of the Olds runabout, spick and span from the factory. While the changes in this latest output of the concern that waits for no date, but "improves as it goes," are of a character that

are not apparent on the exterior, the improvement in the general finish is noticeable at once. It is a handsomer vehicle throughout than the preceding machines. A new carburetter has been adopted, and a modification of the explosion chamber introduced. Heavier axles are employed, and they have been reinforced by trusses. Steel sprockets have been put on, and wooden artillery wheels have been adopted as the regular equipment, in place of wire ones; the horsepower has been increased one unit from four to five, and the body and seat widened slightly.

He would take no pleasure in locating the seat of trouble, than which task there is nothing more pleasant—when success crowns his efforts.

Westward, the star of progress and automobile sense still makes its way, while the effete East is tied to the traditions of its aldermanic forefathers. Out in Carrie Nation's land, the city of Topeka has a speed ordinance permitting sixteen miles an hour, except in certain busy streets, where it is limited to eight miles.

The patient telegraph operator has had to bear the blame for many slips in some of the marvellous pronouncements on the Paris show that have been appearing in the daily papers, while the intelligent translator has not gone scathless. One journal speaks of the "production of a comfortable, well-balanced and noiseless frame" as one of the triumphs of the exhibition.

A second defeat has been encountered by Harry S. Woodworth, of Rochester, N. Y., who was arrested and convicted last May charged with illegal speeding. The Appellate Division of the Supreme Court last week handed down a decision affirming the conviction. In spite of this it is probable that Mr. Woodworth will carry the case to the Court of Appeals.

As the Governor of North Carolina said to the Governor of South Carolina, it's a long time between—the reports of the Lehwiss globe girdling expedition. It is now well nigh a year since the doughty doctor and his companions started on their long journey, and they were last heard of at Moscow several months ago. Evidently the path of the automobile in the roadless countries is not a pleasant one.

From Paris comes the story of a combination automobile and flying machine that is to astonish beholders. Arthur Ware, of New York, an architect and engineer, is the inventor. Ware keeps the details of his invention a close secret, and declares that he can rise easily from the ground and surmount obstacles without difficulty. He promises to make a trial of his invention in the Bois de Boulogne soon.

On her way from the steamship wharf to her hotel last week Mrs. Langtry was the victim of an accident, her cab being struck by a street car. Upon being extricated from her unpleasant predicament the "Jersey Lily" bewailed the fact that she had not been in her pet automobile. "Elizabeth would have got out of the way," she said. "She is so named because she is strong minded and dependible, and not addicted to escapades."

"We might as well try to keep out the Atlantic with mops as try to stop this use of high speed cars. In dealing with this question we have to consider not only what is taking place now, but what will go on in five or six years. Already the horse is being superseded. He was master of the situation for many years, and the progress of mechanical locomotion on our roads was stopped out of deference to his whims and his fears. Nowadays he takes no notice of motor cars," says English Engineering.

MORE FRENCH FEATURES.

(Continued from page 444.)

De Dion & Bouton are placing on the market a cheap one-cylinder car called "la Populaire," and one of these little cars, driven by Cormier, has just completed the round tour of all the principal capitals of Europe. The motor is a 6 h.p., placed vertically in front on the car. There are three speeds and reverse in the gear box, placed near the back axle, which is double. In addition to the fixed axle, there is a double live axle driving into internal crowns on the back wheels. This little car is sold to the public for 3,900 francs.

There were several combined electric and petrol cars in the exhibition, but the most remarkable of these is the one presented by Krieger & Co., who claim that they have succeeded in turning out a completely successful vehicle, under a patent taken out by Monsieur Krieger, who himself explained to me the principle of his patent. The difficulty with the "volture mixte," as the combined petrolectric car is called over here, has always been the question of hill climbing, for on a steep incline the absence of a low gear made the conditions of the motor the worst possible. By means of an ingenious method of compound winding, M. Krieger varies automatically the current supplied by the dynamo, which is coupled, in place of a fly wheel, to the motor, so as to give a high voltage and a low current, or a big current and a low voltage, the motor turning always at its maximum speed and utilizing its power to the best advantage, according to the gradient of the road. The car may even be stopped by jamming on the brakes, and the motor will still continue to turn, without injuring either the dynamo or the electric motors, of which there are two, one by the side of each front wheel.

Amongst those who have followed most closely on the heels of the Cannstadt Daimler Co. is the firm of Cottereau & Co., of Dijon, who exhibit a car with a four-cylinder motor giving 16 h.p.. This car is very compact, and has mechanically operated inlet valves placed on opposite sides of the cylinders to the exhaust valves. The regulator is a throttle valve on the inlet, and the ignition is by the rupture of a magneto current in the cylinder. A very excellent method of advancing the ignition is provided with this motor with a spring dash pot, which takes the blow of the rupture lever should there be a back fire. The frame is of stamped steel, and the transmission is by chains, working through a change of speed box containing four speeds and reverse, the fourth speed being direct and without any intermediate gears. Messrs. Cottereau will bring out in February next a new model one-cylinder, two-seated car weighing only 350 kilos. The motor will give 6½ h.p., and will have a mechanically operated inlet valve and all the improvements of the larger motor.

Wise in the Game.

It might have been the heat in the cafe from which they emerged that made their faces florid, or it might have been the cold. They wore big automobile caps and fur-trimmed coats, and there was a suggestion in their speech that their tongues, too, were trimmed with fur. It was plain that they had been out on the road and had experiences, for a chauffeur in attendance was carrying a broken chain.

A fakir on the sidewalk of Forty-second street was selling mechanical toys, chief among them being tin automobiles, with the wheels set so that the toys would run in a circle on the pavement. The stout one on his arm and ejaculated:

"Huh! There, that'sh the kind of machine y'oughter have. Thats'h just 'bout whatcher could run. Huh?"

"Betcher that you couldn't runev'n one—them!" retorted the other.

Just then, one of the toys ran a wheel in the crack between the flagstones and overturned.

"Sh's 'ti'tched!" exclaimed the bigger one. "There, there'sh way yo'd runnit. Say, there, young fel, yo'd better picker upper th'won't be nuffer gaslene lef' to termaker highbol."

"Say," said the slighter man, "tell yer Bob, get one an' I'll race yer on the poo' table. Go me?"

They proceeded to buy them each one of the toys, and while the big man was coaxingly laboring with the fakir to pick him out the record holding machine, his companion took out a knife, and after cutting away the little leaden chauffeur, he proceeded to cut off the top and tonneau and sides. Finally they started back for the hotel they had left, the slighter man carrying his little machine "stripped to the engine and wheels," the engine being a few clock wheels and spring. Their chauffeur walked behind with the grins of several bystanders reflected on his own face.

Living Down Prejudice.

Even to-day, in spite of the convincing demonstrations of its thorough practicability that have been made, the automobile is on trial as far as the general public is concerned. There has been so much emphasis laid on its ability to go wrong at any and every stage of its existence that many people have come to believe that a state of trouble is its normal one. The proofs of its reliability are received with surprise, sometimes with incredulity. Of course, all this will eventually disappear. A considerable section of the people know better than this now, and their number is being rapidly augmented. But the process must necessarily be a slow one. Prejudice is difficult to live down, and there will be no exception in the case of automobiles. Time and the improvement of the cars will accomplish wonders, however.

Bowman Takes on Panhards.

Sidney B. Bowman, of No. 52 West Forty-third street, New York, is back from Europe with a contract for a dozen Panhards in his pocket and the smiling assurance that he is in a position to fill orders for any and all sorts of French automobiles. The Panhard, though, is the one he will stake his money on, because in his opinion it is the "old reliable" model that has been found ever trusty and true. He says that they are still the standard machine in Europe, and that you see more of them than any other breed. Incidentally, Bowman intends to have the agency of a good American car—but s-sh! you can't tell what it will be until the time of the show.

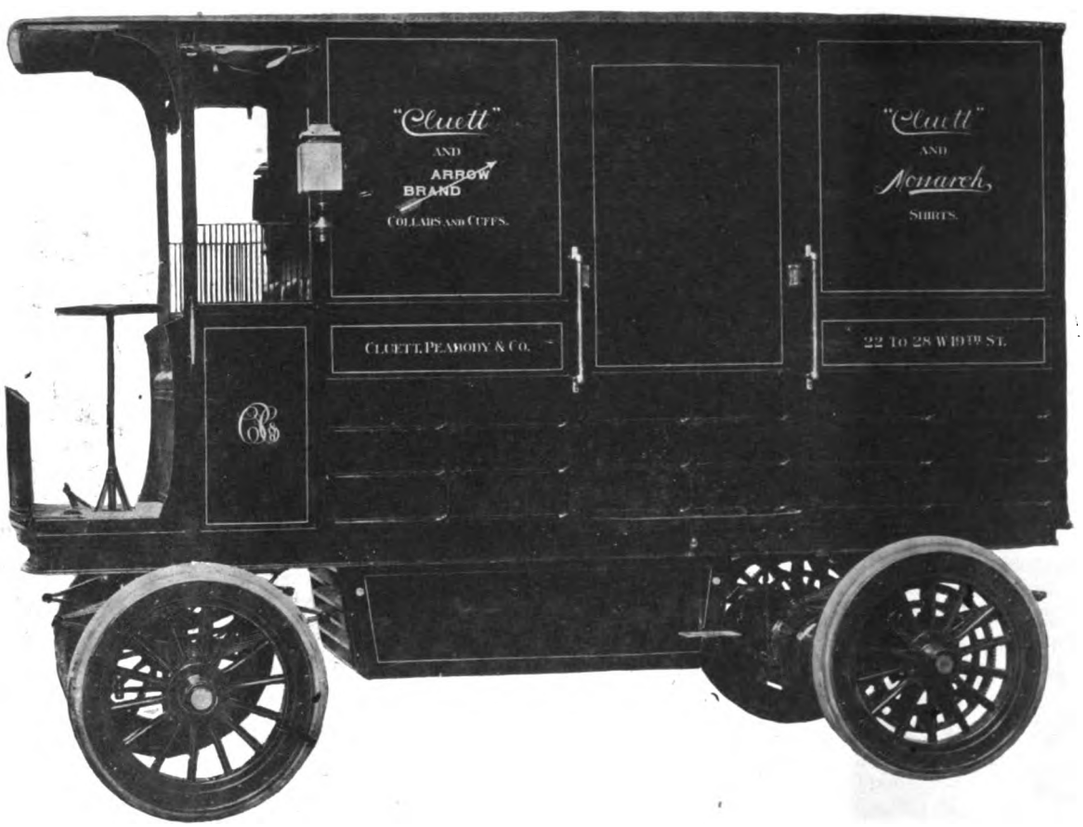
SCHOOL FOR MOTORING

British Institution that Turns Out Full Fledged Autoists in Eight Lessons.

Of course, every dealer makes a practice of teaching customers to drive a car. But the desire frequently exists to take lessons before making a purchase, or even before deciding to buy a car at all. Such a desire is one almost impossible of gratification.

It has remained for a Liverpool (England) man to open a "School of Motoring." It has been in existence only a few months, but marked success has attended it.

The striking thing about the course of teaching pursued is its brevity. It will be something new to the non-motoring public to learn that they can pick up in a week—to be precise, eight lessons of about an hour and a half each—sufficient knowledge of the motor and its working to face the roads on their own account. In this brief course, the proprietor of the school, Ford by name, does not pretend to tell all that is to be known, but he gives a sufficient grounding in the subject to permit any intelligent pupil to deal with and manage his own car.



For the purpose of tuition Ford, in the early part of the course, employs a Benz car, which, as he says, combines many of the principles of other machines, and in the later stages he uses a 9 h.p. Darracq, which, he considers, has a similar advantage.

The first lesson is, of course, confined to to the general principles of the motor and the machinery. In the second lesson, it generally happens that a good deal of recapitulation takes place, and, besides that, transmission is taught. In the third lesson, the learner is allowed to drive the Benz car at second speed, which is slowly increased to about top speed. The fourth lesson introduces the pupil to top speed and curves. The latter are brought on gradually. They are, at first, easy, but before the lesson is done, the driver is confronted with some very sharp corners, which he is encouraged to negotiate on his own account. The fifth lesson is devoted to grounding the learner still further in the knack of dealing with the difficulties of the road, which he has now to take at increased speed.

In the sixth lesson, the pupil is brought among moderate traffic at second speed, and, in the seventh, he is again taken into traffic at rather increased speed. The eighth, and final, lesson of the course is a journey into town, through the busy streets, and the man who can face that is, comparatively speaking, full-fledged.

Asked if he had had any accidents, Ford's reply was in the negative. The care that is exercised is such as to prevent any untoward occurrence, and it may be said that before the pupil is brought into town traffic in the final lesson, he must show that he possesses sufficient confidence and nerve to face it without risk. One of the advantages, indeed, of such a course of instruction is to inculcate confidence.

The pupils come from all parts of the country, which is some indication of the fact that there was room for such a school as he has started. For teaching ladies, it should be added, there is a covered enclosure.

ONE OF NEW YORK'S SHOWY ELECTRIC WAGONS.

Ray's Anti-Rattlers.

The Ray Automatic Machine Co., Cleveland, Ohio, have undertaken the manufacture of a number of metal automobile parts, such as mud guards, bonnets, mufflers, tanks and radiators. The concern is well equipped for the business, and Mr. Ray, who is in charge of the department, is thoroughly conversant with the requirements of the trade, having been identified with their manufacture for several years.

The Ray specialties contain a number of patented improvements, among them being a fastener for the mud guard, which does away with the rattle, so annoying on most guards, and a similar lock on the hood.

The company is in a position to build any design wanted, not being confined to any particular pattern.

Threatens to Loop the Loop.

Since "Barney" Oldfield made such a meteoric debut in the automobile racing game last fall Detroiters think no deed too difficult or daring for him to tackle and accomplish. Now it is proposed to have him make his next spectacular entry in the role of a "loop-the-looper"—in an automobile, of course. To "Tom" Cooper, in whose car Oldfield raced, belongs the credit of proposing the feat.

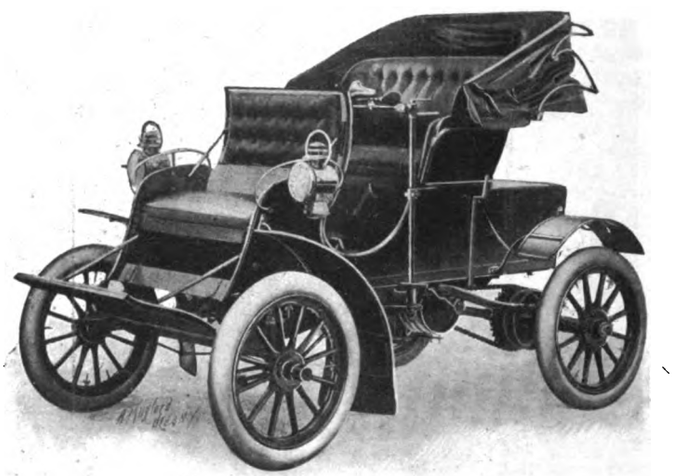
"I don't see why it cannot be done," he is quoted as saying. "The greatest problem would be the construction of a loop strong enough to carry the ton of machine around without collapsing. It don't see why we can't make all our experiments without anybody in the machine, setting the steering gear solid so that the machine will not deviate from the course, and providing an automatic shut off that will stop it after the loop has been made. After we get everything ready the rider can be strapped in and the whole business let go.

"Maybe I won't have the nerve to do it, but if I don't 'Barney' will, and we ought to be the greatest attraction in loop-the-looping that ever came down the pike.

"The St. Louis Exposition is coming," Cooper continued, "and we could have a loop built there that would be plenty solid enough, if it has to be constructed of masonry and steel. The '999' is the fastest machine in the world, and it will certainly be an attraction alone. When you add the sensational performance of the loop it ought to be the greatest money coiner that ever happened."

How the Man Dodges.

"Did you ever watch a man dodge an automobile? If not it is an interesting study," remarked a man who observes things.



"The average citizen will uncomplainingly step out of the way of a trolley car that grazes his coat tails and gaze admiringly at the pair of thoroughbreds which nearly run him down. He will even smile when he is bumped into by one of those fiends who persist in pushing a bicycle on the sidewalk. Man takes glee in running across the railroad track in front of a fast train and then turning around with a pleased smile and lingering to watch the flying engine and cars. But just let the chauffeur make his unearthly whistle croak and watch the face of the citizen.

"He will dance up and down and say things that would cause an application of the blue pencil right here were they inserted. He will glare at the driver of the automobile and make remarks derogatory to the social status of his ancestors back to the dawn of creation. Just why this condition exists is hard to tell, but the man with the disposition of a friendly puppy becomes a glowering demon of hate whenever he has to get out of the way of an auto."

Newness in the Knox.

Wood wheels, a lengthened wheel base, a more powerful engine and a general increase in strength mark the 1903 Knox gasolene car, samples of which are now being shipped to agents.

The Knox air cooled engine has been retained and improved in detail. The number of cooling pins in the cylinder has been increased, together with the size and speed of the fan. The engine stroke has been increased one inch, making it, it is claimed, the largest and most powerful successful air cooled engine in the world. The folding front seat of the body has been made wider, deeper and much more comfortable in every way, and will easily seat two grown persons. Brass arm rails have been added to the sides. The finish and trimming of the body has been improved, and an option of two colors of paint will be given—dark red with brack arimmings and gold stripe, or dark Brewster green with black trimmings and gold stripe.

The wheel base has been lengthened to six feet. Wood wheels and 30x3½ inch double tube tires are now used. Extra large improved roller bearings have replaced the ball bearings on the running gear, and all the plain bearings on the engine and transmission have been made much larger and bushed with the best anti-friction metal. All bright metal parts, including the lamps, are finished in polished brass instead of being nickel plated. The emergency hand brake has been increased in size and is much more effective.

The oiling system has been much simplified and made much more convenient. A chain, with a guaranteed breaking strength of 10,000 pounds is now used, and it may be easily adjusted by turning a nut on the rear end of the springs. A triple expansion muffler is used, giving a quiet exhaust with no back pressure. The high speed clutch has been greatly improved and is now located inside the transmission casing, protected from all dust and mud. It may be quickly and easily adjusted from the side of the car, and gives any degree of friction with slight pressure on the clutch lever.

The starting of the engine has been made much easier and more positive by an improvement in the priming device. Both the front and rear axles and all other parts of the car subject to strains have been made much stronger and more durable, and the weight is now 1,600 pounds complete. The price has been increased from $1,100 to $1,200.

A Small but Important Feature.

"Ever since I had a narrow escape from a serious fall from the rear seat of a toman car, through the door opening unexpectedly, I have been nervous about the fastenings of such doors," confided an autoist to The Motor World man recently.

"Consequently, I make it a practice to notice how cars are fitted in this respect. It has become almost a second nature for me to glance at the door.

"As a rule there is a locking device provided. In my case, the door had only the spring catch, and it having been only partially closed, not caught, my weight against it, after I had settled myself comfortably, forced it open and precipitated me through the opening. Fortunately we were not going fast, and I came down on my feet.

"It is a wonder that serious accidents have not happened in the past, however. Insufficient means of securing the door or carelessness in closing it might each cause such an accident. But with both a spring latch and a lock of some sort, the danger is practically eliminated."

Have Booked at Chicago.

In addition to these already noted, the following concerns have taken space at the Chicago Automobile Show, which opens on February 14:

Motsinger Device Mfg. Co., Fournier-Searchmont Automobile Co., Wagner Cycle Co., Crompton Motor Vehicle Co., Pope-Robinson Co., Speedwell Automobile Co., J. B. McGanna Co., and the Fischer Automobile Co.

HALL HAS A WONDER!

"Six Cylinders on an Oscillating Disc" That Plays hob, he says, With Existing Motors.

If one-quarter of the claims made for a gasolene engine, for automobiles and launches invented by F. E. Hall, of Portland, Me., are borne out by its performance, Hall has a fortune within his grasp, and the world will be even more enriched than he. Unfortunately, claims rather than facts, are all that have yet been given forth.

The engine, it is claimed, "secures six times the power given by the ordinary type, with no increase of friction and a smaller consumption of fuel.

"It is composed of six cylinders operating on one oscillating disc which turns the shaft, everything being inclosed in one large cylinder so that when the engine is mounted there are only the upper semicircle of the casing and the lever which starts and stops it, in sight. There are no valves, no packing of any description, no balance wheel, no noise, and the engine can be run at any speed from twenty-five to a thousand revolutions, and can be reversed at full speed with a single lever. The muffler is inside the large cylinder.

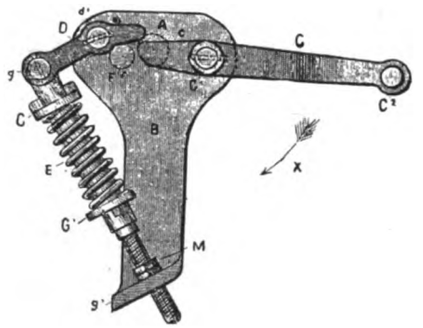
"The 20 horsepower engine weighs only 350 pounds, is 28 inches long and 15 inches in diameter. The engine of five horspower is about the size of a large coffee pot.

"My business," Hall is quoted as saying, "led me to frequently use an automobile, for which, of course, some sort of a handy engine had to be found. Not satisfied with those on the market I began work on one of my own, and this is the result. It has been tried under nearly all conditions. It is noiseless, odorless, does not vibrate and requires practically no room. It will run in any position, or under water."

The Group in the Fifties.

A new clustering of automobile establishments has begun in and about the blocks between Fiftieth and Fifty-fourth streets, Sixth avenue and Broadway. The Central Automobile & Storage Co., with its big place at No. 1,684 Broadway, reaching through to Seventh avenue, were the pioneers in the neighborhood, but they have several neighbors now, and a few more are promised whose size and importance are sufficient to give the locality quite a character as an automobile centre.

Already the Central concern has for neighbors Alex Fischer, in Fiftieth street; the Knickerbocker Automobile Station, in Fifty-first street, and the newly launched concern of Fickling & Fulton, in Fifty-fourth street. Two big newcomers have engaged sites close by. These are the Mobile Co. of America, which will have its New York headquarters at the corner of Seventh ave. and Fifty-fourth street, and the Rainier Co., which has begun the erection of a new building at the corner of Fiftieth street and Broadway.



To Prevent Crank-Kicking.

Cases are on record of autoists who have suffered broken bones from the "kick" of a starting crank, resulting from back firing at an unexpected moment. Such occurrences are annoying, even when not attended with such serious results.

To obviate them there was exhibited at the Paris show just closed a starting handle which automatically disengages itself at the slightest attempt of the motor to back fire, and so prevent these unpleasant and inconvenient experiences.

It is known as the "Anti-Shock," and, devised by an engineer named M. Duchene, has just been put on the market.

It consists of a plate B, which is to be keyed at A on a shaft of the engine. The handle is pivoted on the plate C, as is also at d1, the

short lever D, the end of which bears, owing to the action of the spring E, against a stop F, and lightly on the end of the lever C. The spring E is so mounted that the effort necessary to compress it is slightly above the degree of compression of the explosive mixture in the combustion chamber of the motor.

The operation is as follows: To start the motor, turn the handle in the direction shown by the arrow; if all goes well, the whole device will turn as one piece; if, however, there is any tendency to premature explosion, the force of the back fire is taken up by the spring E, which, becoming compressed, causes the lever Dd to be lifted off from the end of the starting handle proper, the latter thus becoming quite free and independent, and receiving no shock whatever.

To put the handle in position for a fresh attempt to start the motor, it is only necessary to give it one complete turn. The "Anti-Shock" starting handle costs about $10; it is made in two sizes, one for motors under 8-h. p. and one for engines over that power. The device can be fitted to any engine.

Serpollet Steamer Here.

A new Serpollet touring car arrived from France a few days ago for the use of L. C. Weir, of the Adams Express Co., who keeps it at the Barry & Hayes garage, at No. 33 East Fifty-eighth street.

WHITNEY ON CHAINS

How he Came to Adopt his Standards and Their Value to the Trade.

An ardent advocate of the adoption of a standard of driving chains for automobiles is President Clarence E. Whitney of the Whitney Mfg. Co., Hartford, Conn., who has just returned from a most successful trip throughout the Middle and Western States. A large number of concerns have adopted the Whitney chain, influenced by its unusual merits.

More than a year ago the Whitney company took up with automobile makers the matter of standardizing chains, the idea being to establish standards before the industry had entered upon its period of rapid growth.

To a Motor World representative Mr. Whitney traced the course taken by his company.

"There should be a universal standard for roller chains," he said. "We did not try to force our standards on the market, but as long ago as November, 1901, before roller chains were used in quantities, drawings of the Whitney standards were submitted to automobile manufacturers, and a strong appeal was made for ideas, criticisms and cooperation in determining the best dimensions for rolls, bushings and rivets.

"Many automobile experts and engineers have indorsed the Whitney standards; others have refused to go on record with an opinion, but up to date no one has criticised them, with the possible exception of chain manufacturers offering other standards.

"At present a number of chain builders are making the Whitney standards, and it is hoped that all automobile manufacturers will give this important question serious attention.

"We claim for our roller chain standards the best proportions; the largest rivets, which give more bearing surface, lessen elongation and give greatest strength (material being equal); larger and thicker rolls that can be well hardened without springing, and will stand abuse without cracking, and will revolve better than smaller or thinner rolls and thereby wear the sprocket teeth much less; the bushings sufficiently thick to harden perfectly without springing.

"Lastly, and a very important matter, single roller chains of all standards will run on sprockets cut for Whitney standard chains in case of an emergency. This is not the case if sprockets are cut for other standards."

The Whitney chains are made in sizes from ¾-inch to 1½-inch pitch, and 5-16-inch to ¾-inch widths.

The Smith & Mortenson Co. will remove from West Thirty-eighth street to No. 142 West Thirty-ninth street, this city.

As to Motor Houses.

In building a motor house it should always be remembered that the floor ought to slope either inward toward a central drain or to one side, so that in case of any leak the gasolene will run off and not get collected in any quantity under the car. But in addition to this, extra security may be obtained if desired by having two or three buckets of wet sand in the corner of the shed—wet sand is by far the best extinguisher for any kind of oil or spirit fire. This is always worth while to remember.

Sawdust is also not a bad cover for the floor, but it is slightly more inflammable. Either sand or sawdust helps to absorb any oil which may drop out of the bearings. This applies to a car in which oil and not grease is used.

For roller bearings, and even for plain bearings, oil is preferable to grease, and there is no doubt of its superiority in the case of those motor cars which are called upon to do the hardest and fastest work.

Brakes That are Too Effective.

There is such a thing as having brakes that are too effective—or, at least, of making too sudden application of them. An autoist learned this to his cost a short time ago in an experience that he will not forget in a hurry.

On a very steep hill he missed in changing gear, and the car began ti run backward. It had gathered some speed before the rear wheel brakes were applied, somewhat too forcibly perhaps, and being heavy behind with two passengers to one in front, it rose straight up till the rear end rested on the ground. In this position the starting handle, which is a fixture behind, got twisted, so that, after the passengers had gathered themselves up and returned the car to its normal position, the engine could not be started. The use of some tools brought the handle round far enough to start the engine, and the car resumed its journey.

Soubrette, Monkey and Motor.

A soubrette on tour at New Haven, Conn., while riding in an electric vehicle met with a terrible misadventure last week. She had taken her monkey—a real one—for a ride, and it suited the simian's fancy to seize hold of the "lever" that controlled the power, and, gripping it firmly with his tail, caused the vehicle to dash into the curb. The vehicle was smashed to smithereens, of course, but the soubrette was able to give her performance as usual that day.

The Tell-Tale Grease Spot.

A few drops of oil under the car make a pretty good tell tale if you like to keep "tab" on your mechanician. If he says he has oiled or greased the bearings and the floor is spotless, although the car has been standing in the same spot, it is long odds that he is—well, prevaricating. If you want to be on the safe side, have him do it again under your own eyes.

Motor Truck for Telephone Use.

The all around usefulness and economy of motor business vehicles were shown in this city one day last week. A new truck had just been delivered to the New York Telephone Co., and was being given its first real test in the hauling and handling of the big cables.

Heretofore it has been necessary to cart the cables, on their drums, to points of distribution. There manually worked windlasses were secured in position and six men put to work drawing the cable through the underground pipes. The manholes are approximately 280 feet apart, and it takes the six men thirty minutes to pull a cable through, in addition to the time used in setting up and taking down the hand windlass at each point of operation. With the electric truck and its windlass the cables are carted to the point of entering and then the truck moves on to the next opening. Here the electric windlass is brought into action and the 280 feet are negotiated in seven minutes, this being as fast as the cable can be fed. Once the cable is through there is no time wasted in taking up, loading and unloading.

Second-Hands His Specialty.

It's here at last. The automobile business has truly "arrived." Its coming was not hailed by birds that were sweet harbingers of spring exactly, but by a very wise bird who is always found where crumbs are likely to be thickest. In short, L. C. Jandorf. If you've a second hand machine to sell or exchange, it doesn't matter what it is, how old it is or hardly anything else, Jandorf will buy it or trade you. If he doesn't don't look any further; throw it away or present it to your dearest enemy. Jandorf is a born trader. Under the name of the New York Automobile Exchange, No. 1,786 Broadway, a Motor World man discovered him last week. He has already corralled a storefull of second hand machines, and business was in full blast. Yes, he was ready to buy anything or sell anything, and in addition expected to take the agency for several makes of cars, he announced between scurries from one end of the store to the other.

About Mechanical Valves.

Although so many of the French makers are fitting mechanically operated inlet valves, it should be clearly understood that several of them are not placing the valves on opposite sides of the cylinder head. That is to say, instead of having the exhaust valves on one side of the engine and the inlets on the other, with a separate cam shaft to operate each set of valves, the valves are all placed side by side, the exhaust and inlet for each cylinder being on the same side and operated by a single shaft. This, of course, tends toward simplicity, but it has objections of its own, although the very fact that it obviates the necessity of a second valve shaft and gear is a strong point in its favor.

New Zealand's Sane Law.

Common sense plays a very large part in the makeup of New Zealanders, as their general legislation shows. Within a short time they have tackled the automobile question, and handled it in a manner void of offence and worthy of emulation.

In effect the act, which was passed in September, allows that automobiles may be driven at any reasonable pace in the country, but in towns they are subjected to the same restrictions as horse propelled vehicles, which are controlled by local laws under the supervision of the colonial secretary. It has not been found necessary to define a speed limit either for horse drawn vehicles or automobiles.

The only difference to the rate of speed is the following: "The person in charge of a motor car shall not permit such car to travel along a road, street or public highway at a greater rate of speed than is reasonable."

Keeping Pressure Applied.

Pressure should always be kept on screw down feed lubricators serving heavy grease to bearings and drivers should get into the habit of giving the caps of the lubricators an eighth, quarter or half turn frequently, as overmuch is vastly better than too little lubrication in these parts. When taking out a new car it is best to make certain that the grease cup has been filled and screwed down, and filled and screwed down again and again, until the grease is really serving on to the bearing, for in some cars the pipe leads from these lubricators are so long that several charges of the lubricator are necessary to fill the pipe before the grease really reaches the bearing. New bearings have often been jammed for lack of this precaution.

Too Lavish use of oil.

There is such a lavish use of oil and grease in connection with motor cars that it is almost an impossibility to prevent its dripping on the floor. While there it of course comes in contact with the tires—that is, unless unusual precautions are taken to prevent it. But that these precautions are worth while every one who has given the matter attention knows. Rubber and oil are natural and life long enemies. The former soon goes to the bad if it is kept in contact with oil. The latter soon rots the tire and destroys its life. With tires at their present price a little care in this respect will save a great many dollars.

When a Chain Breaks.

Should a chain break and it cannot be repaired, it is always possible to get home on one chain. The free countershaft sprocket must be prevented from revolving (this can usually be done by winding the broken chain round it and fixing it to the frame), and the car can then be driven, but it must be noted that holding one side of the differential nearly doubles the speed, so the car must be driven very carefully, or damage may be done to the differential.

LIGHT ON LUBRICANTS

The Good, Bad and Indifferent Kinds Described —Charcoal-Filtered Oil.

That there are cylinder oils and cylinder oils is a cold, concrete fact that is sooner or later—usually sooner—borne in on autoists. Suitable oils accomplish their purpose. Unsuitable ones are at best a makeshift, at their worst only a little better than water or other similar liquid. A little experience teaches the autoist which is the right and which the wrong sort.

"Cylinder oils may be divided into three groups," remarks a man who has made a study of the subject.

"First, there are the transparent pale amber-colored oils, produced by distillation and treatment with sulphuric acid and soda, from the tarry residuum contained in the manufacture of petroleum burning oil. Oils of this class were originally used for the lubrication of steam cylinders, but their use has now been almost, if not entirely, abandoned on account of their deficiency in respect to body and their low flashing point.

Second, there are the opaque dark greenish brown oils, prepared by settling crude petroleum in tanks subject to heat, and by filtration through canvas, wire gauze, waste, or some similar mechanical medium, in order to remove sand or grit, and by partial distillation to remove the lighter and more volatile fractions. As the cylinder oil produced by this process is the portion which remains in the still, it is evident that it must retain all the tarry or bituminous matter present in the original crude oil, but in a larger percentage in proportion to the reduced volume of the bulk. It is also evident that when, as in steam cylinders (in some to a greater extent than others), tarry deposits are to be apprehended and deprecated, and still more in the case of motor cylinders, in which, from the intense heat, the production of such deposits may be promoted by the partial destructive distillation of the lubricant, the introduction of such a tarry basis ought to be avoided. There is, however, no objection to the use of such oils in an oil-tight gear-case, or on ordinary bearings adapted for the use of oil, save the general inconvenience of unnecessarily multiplying the oils to be used on any car.

"Third, come the opaque dark amber colored oil, produced by the Cheeseborough vaseline process by the filtration of oils of class 2 through beds or columns of animal charcoal at a high temperature. The effect of this charcoal filtration is to slightly reduce the body or viscosity of the oil, but as this reduction is due to the withdrawal of the natural tar or bitumen, which can hardly be regarded as a lubricant, I do not think that the loss of this meritricious body can in any way except favorably affect the value of the oil.

"On the other hand, it has been found over and over again taht in cases in which, from the construction of the cylinder, or priming, or from other conditions, trouble was occasioned by the use of natural unfiltered oils from the formation of deposits, or from imperfect lubrication, these sources of trouble have disappeared when charcoal filtered oils—either pure or enriched by the addition of a little fatty matter—have been adopted.

"The reason for the removal of the deposit difficulty has been suggested above. The reason for the superior lubricating properties of charcoal filtered oils is probably due to the greater facility with which they seem to permit of more perfect diffusion through steam, and consequently of their more uniform and complete distribution over the walls of the cylinder and the sides of the pistons and valves. Some idea of this effect may be obtained by allowing a drop of each oil, natural and filtered, to fall on a hot metal plate and by observing how much more rapidly the filtered oil spreads over the surface.

"The characteristic differences of the oil may also be seen in the behavior of natural and of filtered oils in passing through the glass tube of a sight-feed lubricator. The natural oil, it will be seen, hangs on tenaciously to the nipple, from which it parts reluctantly in a pear-shaped drop, which ascends through the water in a wobbling manner, smudging and obscuring the glass on its upward course. The filtered oil breaks off sharply in a well-defined globular form, and shoots directly to the top of the tube without touching the sides."

Willis Gets a Wonderful Plug.

Among other features in the line of improved ignition to be seen at the show will be a newly patented spark plug of German make that is claimed to be absolutely non-carbonizing, non-breakable and proof against interference by oil. It will be exhibited in operation and giving regular sparks while having oil dropped on it.

This plug is the invention of L. G. Herz, who formerly was employed in the Mercedes factory. It is known as the Herz plug, and the agency for the United States and Canada has been taken by E. J. Willis, of 8 Park Place.

Neither porcelain nor mica is used in the construction of the plug, a composition of stone being substituted. A representative of the Motor World saw the merits of the plug demonstrated recently, and the exhibition certainly was remarkable. The plug was first covered with oil, and oil was put into the explosion chamber of a Kelecom engine. When the motor was started a fat spark was given regularly, with never a miss. The engine was run until the plug was hot, and then it was removed and dropped into cold water to show that it would not crack. It did not seem to be in the least injured. There is no platinum in it, and the parts are interchangeable. The plug is not an economical one, but it seems to do the trick, and it is claimed that it never has to be cleaned.

PAINT AND VARNISH

On Motor Cars They Suffer Greatly From Neglect and Severe Usage.

It is a somewhat regrettable but very noticeable fact that the average autoist is not so particular about the appearance of his vehicle as is the average carriage owner. He has, however, several excuses on his side for deficiency in the matter of paint and varnish, one at least being that however spick and span his car may be at starting his journeys are seldom short enough or over sufficiently clean roads for such a decorative state to persist to their conclusion.

Another point, also, which deserves some notice, is the want of durability of varnish or paint under the conditions prevailinga with a motor vehicle, which, though sometimes due to lack of the laborious and prolonged care given to the production of a surface on good coach work, seems to be more justly attributed to the deteriorating effect of road dust at high speeds. The effect of the "sand-blast" on such hard materials as glass and porcelain is familiar, and there can be little doubt that to a similar action is due the want of durability of motor carriage paint work. The principal effect will usually be noticed on the paint at the back of the car, where the inrush of dust-laden air is most violent; and it is difficult to see how any painted surface can be made to resist it.

Still, a good automobile is quite as worthy of attention to its outward appearance as any other carriage, and neglect of it produces an unfavorable impression on the uninformed public.

Why not Certificates for Horsemen?

"Now that autoists are becoming so numerous on the road, I think it time to enter a plea for the better regulation of horse-drawn vehicles," remarks a facetious user. "At present, any one appears to be regarded as competent to drive a horse and carriage, with the result that accidents are frequent. As it is becoming recognized that the horse is a creature of uncertain temper, I do not see why certificates of competency should not be issued to drivers who have satisfied some one appointed by the local authority that they are sufficiently skillful to manage a horse of ordinary habits. The idea may seem strange, but when we remember how many accidents have been caused by shying horses which have got beyond the control of incometent drivers we are justified in the demand.

The Federal Manufacturing Company are felicitating themselves upon having just closed a deal that involves the equipment of all Cadillac automobiles with Diamond driving chains, 1 inch pitch, ½ inch wide.

The Week's Patents.

716,907. Resilient Tire for Wheels. Jean P. Legrand, Levallois-Perret, France. Filed March 26, 1901. Serial No. 52,932. (No model.)

Claim.—1. In a wheel, the combination of a rim having bent over edges, a cover having enlarged and thickened edges which fill said rim under its bent over edges, and a series of hooks spaced from each other and fixed to said cover at the outside of said rim, and extending within said rim, and forming bearing surfaces for said rubber cover against the edges of said rim.

716,917. Motor Vehicle. Hiram P. Maxim, Hartford, Conn., assignor, by mesne assignments, to Morton Trust Company, trustee, a corporation of New York. Filed Oct. 16, 1900. Renewed June 3, 1902. Serial No. 110,061. (No model.)

Claim.—1. In a motor vehicle, a vehicle body, a motor for propelling same, and a bodily removable dash or casing inclosing a portion of the motor, substantially as described.

716,960. Metallic Tire. William Thompson, Woodstock, Canada. Filed June 11, 1902. Serial No. 111,206. (No model.)

Claim.—1. In a metallic tire the combination of the rim and a series of annular sections secured thereto having their meeting edges overlapping to form the tread of the tire and movably embrace the sides of the body portions and provided with a series of internal section spacing protuberances, substantially as specified.

717,000. Internal Combustion Engine or Motor. Charles E. Henriod, Neuilly-sur-Seine, France. Filed Nov. 9, 1898. Serial No. 695,971. (No model.)

Claim.—The combination with a casing, provided with air and fuel admission openings and a mixing chamber, of two valves arranged one above the other with the mixing chamber between them, one of the valves controlling the admission of fuel to the mixing chamber, and the other valve controlling the escape of the mixture of fuel and air from the mixing chamber, a spindle on the last mentioned valve, a hollow spindle on the fuel controlling valve through which the first spindle loosely passes, an adjustable abutment on the casing, an abutment on said hollow spindle adapted to strike against the abutment on the casing to limit the downward movement of the hollow spindle, and an abutment on the spindle of the mixture controlling valve arranged above the abutment on the spindle of the fuel controlling valve, all arranged for co-operation as and for the purpose specified.

717,078. Muffler. Charles E. Christman, San Jose, Cal., assignor to Christman Motor Carriage Co., San Jose, Cal., a corporation of West Virginia. Filed Aug. 8, 1902. Serial No. 118,881. (No model.)

Claim.—1. A muffler comprising an outer and an inner cylinder, means for connecting the exhaust with the inner cylinder, a plurality of condensing pipes located in the inner cylinder and communicating with the exhaust and with the outer cylinder, and a plurality of discharge pipes located in the outer cylinder and communicating with the inner cylinder and with the atmosphere, substantially as and for the purpose set forth.

717,079. Device for Transmitting Rotary Motion to Vehicle Wheels. Oliver Cluts, Cuba, Ill. Filed Aug. 2, 1902. Serial No. 118,075. (No model.)

Claim.—A device for transmitting rotary motion to vehicle wheels and for steering the same, consisting of a revolving shaft suitably journalled, a spindle swivelled to said shaft, a hub fixed at its outer edge to the outer portion of said spindle, a collar interposed between said hub and spindle and supported from a stationary point and being adapted to swing in a horizontal plane and a means for swinging said collar, a ball bearing interposed between the outer end of the collar and the spindle and a ball bearing interposed between the inner end of the spindle and the collar and the ball bearing interposed between the inner edge of the hub and the collar, the hub and the collar at all other points being disconnected from each other.

717,107. Secondary Battery. William Morrison, Chicago, Ill., assignor to King Upton, Chicago, Ill. Filed May 19, 1900. Serial No. 17,206. (No model.)

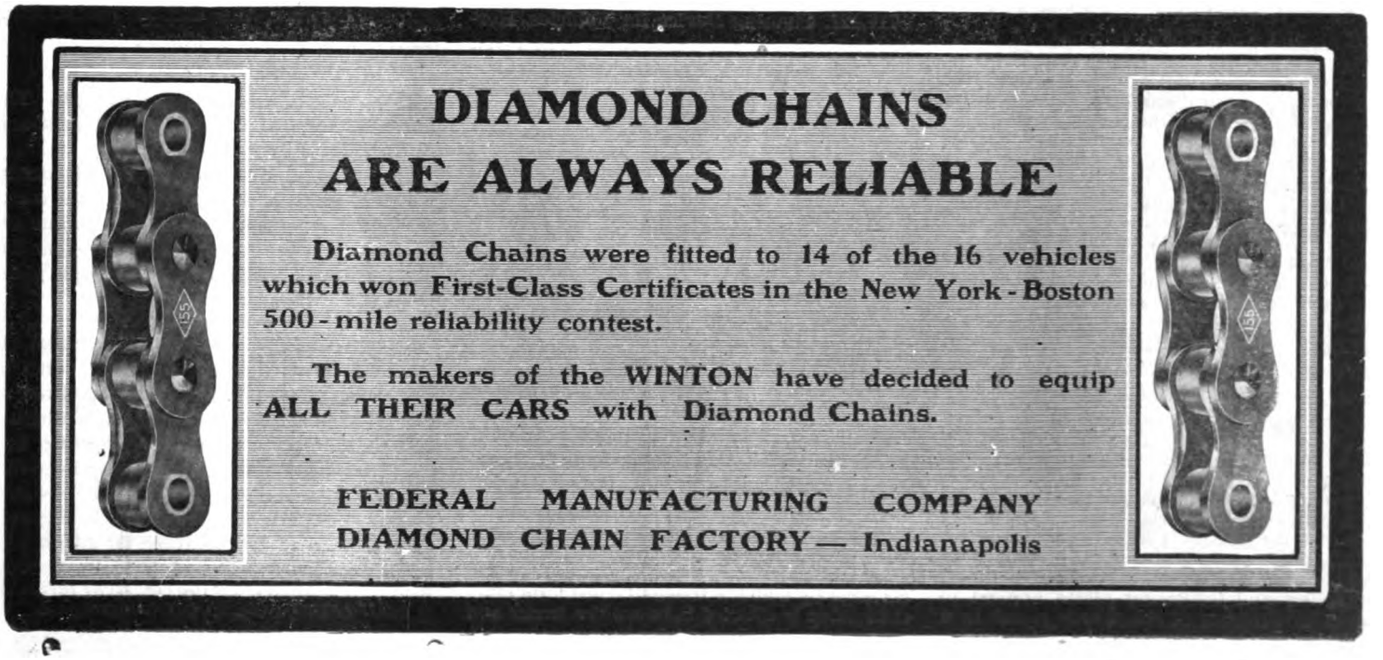
Claim.—1. In a storage battery, the combination of a suitable electrolyte, and positive and negative elements immersed in said electrolyte, one of said elements having a paste containing fluorin.

717,108. Secondary Battery. William Morrison, Chicago, Ill., assignor to King Upton, Chicago, Ill. Filed Aug. 5, 1901. Serial No. 70,954. (No model.)

Claim.—1. A storage battery, comprising positive and negative plates and an electrolyte, in which flourin is present.

2. A storage battery, comprising a negative plate carrying a paste of minimum, a positive plate carrying a paste of litharge, and an electrolyte in which flourin is present.

717,165. Device for Inflating Tires of Vehicles. Ida B. Catlin, Philadelphia, Pa. Filed June 28, 1902. Serial No. 113,682. (No model.)



Claim.—1. In a device for inflating the tires of vehicle wheels, a wheel, an annular chamber secured thereto and having an opening in its side, combined with a non-rotatable plate covering said opening, means for admitting air through the plate into the chamber, and means connecting the chamber with the inflatable tire.

717,250. Vehicle Body. Lewis C. McLouth, Hector J. Hayes, and Joe H. Wissman, Cleveland, Ohio, assignors to the Eastman Automobile Company, Cleveland, Ohio, a corporation of West Virginia. Filed April 22, 1901. Serial No. 56,860. (No model.)

Claim.—1. In a vehicle body, the combination with a lower base frame constructed from a continuous piece of angle iron, of a continuous metal sheet having its lower edge secured to said frame and forming the sides and rear of said body.

717,263. Protector for Rubber Tires. Herbert R. Palmer, Cleveland, Ohio, assignor of one-half to Omar Stoppel, Cleveland, Ohio. Filed Aug. 27, 1901. Renewed June 6, 1902. Serial No. 110,510. (No model.)

Claim.—1. A protecting covering for a

Digitized by Google

vehicle tire, consisting of a flexible backing carrying rivets whose heads are on the outer side of the backing and are in staggered position and nearly abut but do not overlap, and whose shanks extend through the backing and are upset on the inner side thereof, substantially as described.

717,264. Pneumatic Tire. Herbert R. Palmer, Cleveland, Ohio, assignor of one-half to Omar Stoppel, Cleveland, Ohio. Filed Oct. 11, 1902. Serial No. 126,862. (No model.)

Claim.—1. A pneumatic tire, comprising an inner tube and an outer sheath vulcanized together, numerous rivets in the sheath having their heads substantially flush with the outer surface thereof, having their shanks extending through the sheath, washers on the shanks on the inner side of the sheath, the rivets being upset beyond the washers, substantially as described.

717,269. Lubricating Device for Vehicle Wheels. William F. Probst, Chillicothe, Ohio. Filed Sept. 13, 1902. Serial No. 123,289. (No model.)

Claim.—1. The improvement in wheels substantially as herein described, comprising the hub grooved in its outer edge and provided in its opposite faces at its outer edge with the annular rabbets, the slide plates secured at their inner edges in the said rabbets and projecting outwardly from the said hub, one of said slide plates being provided with the radially extending groove in its inner face, said groove being closed at its outer end, the cushion ring seated in the groove of the hub between the said slide plates, and the spoke ring fitting between the slide plates and upon the cushion ring and provided with an oil feed passage and at its opposite faces with oil grooves extending around the ring and supplying lubricant to the bearing between the sides of the spoke ring and the slide plates, and said spoke ring being provided with the radially projecting plate overlapping the groove in the slide plate and extending to the closed outer end thereof, and the roller journalled to the spoke ring and overlapping the oil groove in the side thereof, and operating within the groove of the slide plate, substantially as and for the purposes set forth.

717,292. Throttle Valve. Charles I. Shawver, Springfield, Ohio, assignor to Augustus B. Nolte, Springfield, Ohio. Filed July 14, 1902. Serial No. 115,397. (No model.)

Claim.—1. A throttle valve comprising a casing having an inlet passage, a valve chamber of larger diameter communicating therewith at one end, and a valve seat at the outlet end of the valve chamber, in combination with a valve having an imperforate body portion of less diameter than the valve chamber in which it is longitudinally movable, adapted to fit the seat at the outlet end thereof and having a hollow cylindrical extension on its opposite side fitting within the inlet passage, the wall of said extension having apertures thereto substantially as described.

717,351. Storage Battery. Charles H. Clare, Quincy, Mass. Filed March 1, 1902. Serial No. 96,222. (No model.)

Claim. 1. The improvement in secondary or storage batteries herein described, the same comprising one or more units each consisting of independent porous plates bearing active material, lead plates held in contact with said active material, passage extending between the porous plates, and means for holding the porous plates against each other and the lead plates comprising porous plates protecting and insulating plates applied to the outer surfaces of the porous plates in a manner to prevent the escape of the active material laterally or downwardly therefrom and also forming a protection for them.

717,394. Electric Battery. Henry Halsey, New York, N. Y., assignor, by mesne assignments, to Halsey Electric Generator Company, Jersey City, N. J., a Corporation of New Jersey. Filed April 18, 1902. Serial No. 103,641. (No model.)

Claim.—1. The method of regulating the output of a battery which consists of brushing one of the elements and varying the rapidity with which said brushing is carried on.

717,395. Electric Battery. Henry Halsey, New York, N. Y., assignor, by mesne assignments, to Halsey Electric Generator Company, Jersey City, N. J., a Corporation of New Jersey. Filed Apr. 18, 1902. Serial No. 103,649. (No model.)

Claim.—1. In a battery, the combination of a casing, a plurality of parallel elements supported in said casing, each of said elements having a recess in the upper portion thereof, a cover for said casing, a shaft having its bearings supported by said cover, said shaft being located within said recess when the cover is in position, a brush or brushes carried by said shaft, and means carried by the cover for rotating said shaft, substantially as described.

717,416. Secondary Battery. Isidor Kitsee, Philadelphia, Pa. Filed April 10, 1893. Serial No. 469,822. (No model.)

Claim.—1. An electrode for electric cells, comprising a conducting strip bent so as to provide a series of spaces capable of expanding, independently-formed blocks of active material arranged within said spaces, said blocks being provided with holes or apertures, and means surrounding the electrode and located opposite the face-surfaces of said blocks for holding said blocks in place.

717,417. Gasolene Engine. Ernest E. Koken, St. Louis, Mo. Filed June 14, 1901. Serial No. 64,498. (No model.)

Claim.—1. The combination with a high and a low pressure cylinder and an inlet and exhaust chamber; of a rotary valve for the high pressure cylinder adapted to serve as a means for communication from the inlet chamber to the said cylinder, and from said cylinder to the low pressure cylinder and to the exhaust chamber successively.

717,421. Steering Device for Vehicles. Herbert J. Leighton, Syracuse, N. Y. Filed Oct. 29, 1902. Serial No. 129,233. (No model.)

Claim.—1. In steering apparatus for vehicles, in combination with a main axle having wheel bearing axles pivoted thereto, lever arms secured to said pivoted axles, a link connection between said lever arms, a steering rod operatively connected with said lever arms, and a steering shaft; a steering pinion eccentrically secured upon said shaft, and means between said pinion and said steering rod connecting them in movable engagement whereby the turning of the pinion moves the rod and wheels, said engagement being at the minimum radius of the pinion when the wheels are in position for running in straight course, by which means the wheels are locked against accidental shifting, substantially as specified.

717,430. Transmission Frame for Automobiles. Henry K. Milner and John M. Lansden, jr., Birmingham, Ala. Filed Aug. 2, 1901. Serial No. 70,654. (No model.)

Claim.—1. The combination with the body portion of a motor vehicle provided with side sills, and an axle, of a transmission frame or carriage by which a free and constant sliding connection is effected between the frame and the side sills of the vehicle body, a motor located on said transmission frame or carriage, a gear on the shaft of the motor, a counter shaft, a differential gear thereon intermeshed with the gear on the motor shaft, sprocket wheels on the counter shaft, wheels in which the axle is supported and sprocket chains extending from the sprocket wheels on the counter shaft to sprocket wheels on the hubs of the vehicle wheels.

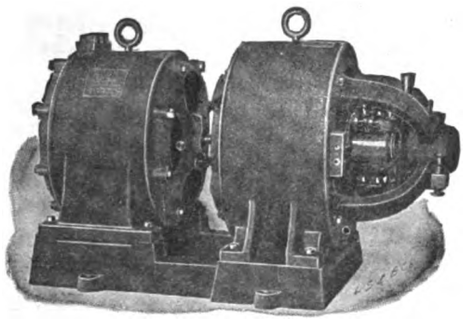
717,508. Governor for Explosive Engines. Harry H. Segner and Charles B. Segner, Hagerstown, Md. Filed Sept. 13, 1901. Serial No. 75,245. (No model.)

Claim.—1. In an explosive engine the combination of the reciprocating rod connected with the exhaust valve, a latch pivoted on said rod, a stationary catch on the frame adjacent thereto and adapted to directly engage said latch to hold said rod in position to hold said valve open when the speed exceeds that desired, and a sliding weight mounted on said rod to engage with said latch and hold it out of engagement with said catch when the speed does not exceed that desired, substantially as set forth.

2. In an explsovie engine, the combination of the exhaust valve, a reciprocating rod for operating it, a latch pivoted to said reciprocating rod.

717,517. Engine and Driving Gear Support for Steam Wagons. Paul H. White, Indianapolis, Ind., assignor to White Steam Wagon Company, Indianapolis, Ind., a corporation of Indiana. Filed March 7, 1902. Serial No. 97,114. (No model.)

Claim.—1. The combination in a self-propelling wagon, of suitable carrying wheels, a frame composed of connected side bars carried by the wheels, a pair of intermediate bars parallel with and between the side bars and supported thereon, a transmission shaft 20 supported in suitable bearings carried by one of the side bars and the adjacent intermediate bar, an engine supported on the other side bar and the adjacent intermediate bar with its shaft in alignment with the shaft 20, driving connections between the engine shaft and shaft 20, a transmission shaft 30 supported in suitable bearings carried by the two side bars and the first mentioned intermediate bar, driving connections between the two transmission shafts, and a driving connection between the second transmission shaft and the carrying wheels.



TRADE MARKS.

39,585. Certain Named Gas Engines. The Lozier Motor Co. of New York, Plattsburg, N. Y. Filed July 10, 1902.

The representation of a wheel, across which a plate is arranged, and two wings which are represented as secured to and extending from the lower right and upper left hand corners, respectively, of said plate. Used since 1897.

Alcool denature, denaturized alcohol, is obtained by mixing together 100 litres of ethyl alcohol at 90 per cent, 10 litres of methyl alcohol at 90 per cent, containing not less than 25 per cent of pure acetone, and 0.5 litre of heavy benzine from coal tar distillation, the boiling point of which varies from 180 degrees to 225 degrees C.; the specific gravity of this mixture, at 15 degrees C., lies between .832 and .835; its thermic value, calculated from the chemical formulæ, is 5,297 calories (kg.d.) per kilogramme.

Peck of Old Lyme Ferments.

To Charles E. Peck, of Old Lyme, Conn., belongs the distinction of proposing a law barring automobiles from the roads of the rural sections. He calls on the legislature of the Nutmeg State to enact a law containing this provision.

Arguing that automobiles "are a dangerous as well as a most damnable nuisance," he wants a law making it a crime to operate them on country roads. If the city cares to run the risk of the plaguey things, Mr. Peck doesn't mind, but, like a brave crusader, he has put his lance in rest and started out to drive them from the agricultural sections. "There are enough members of the legislature from the country towns," he says, "to make just this kind of a law, and it will be a benefit to the country towns and not a curse, as all other laws have proved to be in the past. Now let's have one law that is good for something."

It is much to be feared that the aggressive Peck will have his trouble for his pains. Connecticut now possesses about the best automobile law in existence, and it is not probable that it will undergo any change.

The Centrally Placed Chain.

Although a centrally placed chain picks up less dirt than double side chains, it is well to take some steps to protect it. A simple arrangement is to fix to the bottom of the car a light iron frame covering it with leather laced or strapped to the frame to permit of ready removal. With such an arrangement, allowance must be made for the movement of the carriage body upon the springs, otherwise the gear case rapidly becomes a wreck.

BEFORE BUYING EXAMINE THE

WHITE STEAM TOURING CAR

FOR 1903

THE WHITE IS A STEAM CAR WITH THE DISTANCE OF A GASOLENE AND THE EASE OF OPERATION OF AN ELECTRIC.

In the 500 mile Reliability Contest from New York to Boston and return, arranged by the Automobile Club of America, three WHITE STEAM STANHOPES covered the distance without stop or trouble of any kind—a perfect performance.

THE WHITE STEAM GENERATOR

is absolutely non-explosive, gives pressure in five minutes from cold water, and once in motion is self-regulating.

The same motive power which has been so successfully used in former White models will be used in the new touring car.

Write for full particulars, including Professor Thurston's report on our steam generator, and the official reports of important endurance contests.

THE PORTER BATTERY ENJOINED

NEW YORK, January 8, 1903.

Today the United States Circuit Court of Appeals filed an opinion again sustaining the Brush Storage Battery patent owned by The Electric Storage Battery Company, and affirming the injunction granted by Judge Hazel, of Buffalo, against The Porter Battery, which battery is manufactured by the Porter Battery Company of Chicago, and by whom this case has been defended.

THE DECISION IS OF A MOST SWEEPING CHARACTER AND CONFIRMS THE RIGHT OF THE ELECTRIC STORAGE BATTERY CO. TO ENJOIN ALL MANUFACTURERS OF INFRINGING BATTERIES.

Our Limit.

ONE thousand WINTON TOURING CARS will be manufactured during the current year. Even with greatly increased facilities and a system for production not excelled by another automobile manufactory in the world, we cannot go beyond the one-thousand mark and incorporate in every car the standard of Winton excellence. With this necessarily limited production we cannot expect to meet demand, hence this early opportunity to caution prospective buyers upon the wisdom of getting "under cover" early with their orders.

WINTON SALES BRANCHES AND AGENCIES ARE IN NEARLY EVERY IMPORTANT CITY IN THE COUNTRY. OUR NEW CATALOG IS SO FRESH FROM THE PRESS THAT THE INK IS SCARCELY DRY. DO YOU WANT A COPY?

The Winton Motor Carriage Co., Cleveland, O.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, January 15, 1903. No. 16

FOR COMMERCIAL CONTEST

A. C. A. Committee Makes First Definite Move and Fixes Meeting for Next Week—Those Invited to Attend.

After much deliberation it has been positively decided by the Automobile Club of America to hold in the spring a contest for commercial vehicles. This having been agreed upon, the contest committee of the club has prepared a letter and sent it to all known makers of self-propelled trucks, delivery wagons and other commercial vehicles asking for their co-operation. The letter calls upon the manufacturers who approve of the idea and are willing to aid to meet the committee at the rooms of the automobile club, No. 753 Fifth avenue, New York, on the afternoon of January 22 at 4 o'clock. As the date set falls during the week of the show the attendance at the meeting should be representative and the project set well forward.

What the committee wants are suggestions concerning the plan and scope of the contest and the rules under which it should be run. There have been a couple of minor contests of this sort in England, where the vehicles competed in classes, each with a proportionate load over a fixed distance, with points deducted for stops, but it is the aim of the club committee to arrange, if possible, something more satisfactory than anything done hitherto.

Those invited to attend the meeting are as follows: Morgan Motor Co., Motor Truck & Vehicle Co., Vehicle Equipment Co., Electric Vehicle Co., Mobile Company of America, White Motor Truck Co., Thorp, Plait & Co., Chicago Motor Vehicle Co., Fournier-Searchmont Co., International Power Co., Jenkins Auto Co., Adams Express Co., Engineering Company of America, Daimler Mfg. Co., Upton Machine Co., Trumbull Mfg. Co., Fischer Motor Vehicle Co., H. Bartol Brazier, Manhattan Transit Co., International Motor Car Co., White Sewing Machine Co., Thorneycroft Steam Wagon Co., Paul White Engineering Works, Desberon Motor Car Co., Milwaukee Automobile Co., Massachusetts Steam Wagon Co., S. D. Sturgis & Bros., Union Motor Truck Co., American Bicycle Co., Locomobile Company of America, Stanley Mfg. Co., Edward S. Clark, Foster Automobile Mfg. Co., Conrad Motor Carriage Co., Stearns Steam Carriage Co., Grout Bros., Winton Motor Carriage Co., Loomis Automobile Co., St. Louis Motor Carriage Co., Chicago Motor Vehicle Co., F. B. Stearns & Co., A. L. Dyke, Knox Automobile Co., National Vehicle Co., Woods Motor Vehicle Co. and American Electric Vehicle Co.

Panhards to be Assembled Here.

Panhard automobiles are to be assembled in this country for the American market. The negotiations to this end have been concluded with the Panhard & Levassor Co., of Paris, by A. C. Neubauer, the representative of Smith & Mabley, of New York. Smith & Mabley are to do the assembling work. The complete motors, gears and parts comprising the chassis are to be imported and assembled in a factory whose site will probably be near New York. The bodies are to be built by J. M. Quinby & Co., of Newark, N. J. Under contract with the French company the machines must bear the Panhard & Levassor Co.'s name plate, and be identical in every respect with their car as delivered abroad.

Another Dividend for Gasmobile Creditors.

Another dividend of 5 per cent. has been declared, and is to be distributed among the creditors of the Automobile Co. of America. At Newark, N. J., on Tuesday, Vice Chancellor Stevens, on the application of Chauncey B. Parker, signed an order authorizing Henry C. Cryder, receiver of the Automobile Co. of America, to make the distribution. The Court also allowed some small claims as preferred that had been contested.

Riggs Joins Metzger.

Frank C. Riggs, for many years prominently identified with the cycle trade in Rochester, N. Y., has associated himself with W. E. Metzger, the well known Detroit automobile dealer, and henceforth will take an active interest in the latter's big retail emporium. Mr. Riggs is a clean-cut, energetic, likeable man, who can scarcely fail to make his influence felt in his new position.

FOUR ARE RENOMINATED

N. A. A. M. Names Four Retiring Directors to Succeed Themselves—I. H. Page the Only New one Chosen.

Five members of the executive committee of the National Association of Automobile Manufacturers are to be elected for the three year term at the annual meeting of that body on Saturday morning, January 24, at Madison Square Garden, New York. The full executive committee consists of fifteen members, of whom five were originally elected for three years, five for two years and five for one year, so that each year the term of one quintet expires.

In conformance with the provisions of the constitution and bylaws, the present executive committee met on Wednesday of last week and renominated all except one of those whose terms are about to expire. The nominations were: H. Ward Leonard, Ward-Leonard Electric Co.; Windsor T. White, White Sewing Machine Co.; Lucius T. Gibbs, Vehicle Equipment Co.; F. S. Fish, Studebaker Bros. Mfg. Co., and I. H. Page, J. Stevens Arms &Tool Co. The first four are renominations. I. H. Page is named to succeed W. C. Baker.

At the same meeting new members to the organization were elected as follows: Active—Ajax Motor Vehicle Co., New York, N. Y.; General Automobile & Mfg. Co., Cleveland, Ohio. Associate—The Badger Brass Mfg. Co., Kenosha, Wis.; the New York Edison Co., New York, N. Y.; the Fisk Rubber Co., Chicopee Falls, Mass.; the K. Franklin Peterson Co., Chicago, Ill., and the F. W. Devoe & C. T. Raynolds Co., New York, N. Y.

A special committee was appointed to consider suggestions made for the standardizing of lamp brackets.

The revision of the constitution and bylaws received lengthy consideration, and several amendments were drafted which will be submitted to the members at the annual meeting.

FOURNIER FULL OF NEWS

Devoid of Press Agents' Challengers, he Brings Over a Budget of Interesting Information.

"For business," was the reason of his coming to America given by Henri Fournier on his arrival last Monday. He proceeded to get down to business by getting into touch with the newspaper men right on the steamship dock. Before the Bretagne was fairly lashed to the dock Monsieur Henri had issued a challenge to Alex Winton for a race on the Empire trotting track, and under the influence of the same inspiration he went on and said that he would race Barney Oldfield, or any one, at any time, if the purse was big enough, and that he would bring over the new 120 horse power Moro freak racing machine he is having built for the Bennett cup race, to contest against the car of Winton or Oldfield.

After throwing out this grand "defi" to the wide, wide world, Fournier went to the Cafe Martin, and in his rooms there he and his business partner, M. Edouard Rabourdin, held a reception for the newspaper men, and told all about the cars they were bringing over to delight the simple American folk. In consequence the New York morning papers of Tuesday burst forth with skyrocket articles on the arrival of the "Great Chauffeur." He could not have been better heralded if he had been a wild beast show with a staff of press agents.

After telling all about the machines he will show here, Fournier took out his hammer and exercised a while on M. Augieres, who beat his record for a mile on the Dourdan course. Then, in the course of a general chat, he released some interesting information.

The Mors machine which W. K. Vanderbilt is having built for his use in the Paris-Madrid race on May 24, according to Fournier, will be similar to his own racer in style, but of twenty horse power less. D. Wolfe Bishop is having a duplicate of the Vanderbilt machine made for use in the same race.

Fournier's machine was described by him with much graphic gesturing to illustrate its shape. It will have a four-cylinder engine of 120 horse power, four speeds and a direct drive on the high speed. The rear wheels will be fitted with a new style of pneumatic tire that is guaranteed to be proof against puncture for 2,000 miles. To tell of its shape Fournier said:

"It will be like a boat, only wrongside out."

Then he put the palms of his hands flat together, with the finger tips in front, saying: "Sharp so in front; then back about forty inches, so [spreading his hands so as to make them convex on top, like the forward part of a round botto ned boat] then like this [indicating the underside of an overturned flat-bottomod boat] back to where I am. It comes about here on me [indicating his nose]. Behind me, it goes far back and in slowly, yes, yes, tapering, that is it; but very long behind. No, not like the Baker torpedo; we have beat that. It is more blunt in front. The sharpness is only a little at the end—prow, yes. It is found that what is good for the resistance through the water is good through the air. After you break the air it comes rushing in behind and helps to push you, so that is why you want a short front and a long tail, like a fish."

Fournier expressed great confidence that the Bennett cup race will be held in France, in conjunction with the Paris-Madrid race on May 24, and over that part of the course lying between Paris and Bordeaux, a stretch of 585 kilometres, or 362.28 miles, plenty long enough and to spare for the cup course. The distauce from Paris to Madrid is 1,600 kilometres, or 993.28 miles. The first day's stage of the race will be from Paris to Bordeaux, the second from Bordeaux to the frontier line, and the third from the frontier to Madrid.

Asked who would be in the race to represent the different countries, Fournier replied that Germany would have Camille Jenatzy and Baron de Caters. They will drive specially built Mercedes racers of 100 horse power. When told by Jenatzy what was wanted the head designer of the Mercedes plant dubbed the machine an "Idiot," and by that name they will be known, according to Fournier. Fournier evidently has great respect for Jenatzy, and he launched into praises of him as being a pioneer record breaker and doing a nervy and wonderful thing when he went out three years ago and made a mile in less than a minute with his electric car, "le Jamais Content." The English Napiers, Fournier conceded, would be managed by S. F. Edge and Charles Jarrott. With regard to the representatives of France he said: "Well, Fournier for one, and I guess the others will be the Farman brothers, Henri and Maurice. They will drive Panhards and I my Mors."

Chatting at random, Fournier corroborated the news printed in The Motor World last week concerning the Mercedes of 1903. It was true he said, that the regular touring car pattern would be of 60 horse power and built lower. He dwelt ecstatically upon the new electrically regulated speed clutches, the rights to which have been bought by the Laimler concern. This permits of the speed changes being made with the utmost graduation and as simply as by pressing a button. Fournier says that just before he left France the Di Dion people bought a license to use this electric clutch.

Speaking of "Augieres," the "Paris merchant" who beat Fournier's record for a mile and now holds the world's figures of 46 seconds, Fournier explained that the name is not a nom de plume, as was reported, but that the man is a Parisian jeweler, whose correct name is Emil Augieres. Then the hammer was unsheathed. All Augieres ever has done and can do, according to Fournier, is to drive a mile straightaway, and "Pooh! That is nothing. Any one can sit still when there are no corners to turn, no bumps, and no balancing to be done. He was in all the big races, first the Paris-Bordeaux, the Paris-Berlin, the Paris-Bordeaux again and the Paris-Vienna, but he never went more the twenty-seven miles. He either would break down or 'fall down.' Any one is liable to break down, but falling down is different. He is good for a mile on a straight road—viola! Poof!"

On the St. Louis and the Cymric, both due here this week, Fournier said he had five cars. Two are Renaults, each of 9 horse power. One is on the pattern of an English cab and the other is a landaulet with a swing top that permits of the passenger seats being inclosed or left open. Another is a 1902 Mercedes of 40 horse power, a double phaeton with the entrance in front, King of the Belgians seats and finished in pearl gray. The fourth car is a Mors of 18 horse power, of triple phaeton pattern with a very low frame and a seating capacity for seven persons. The most interesting of all if the fifth car, a combination of gasolene and electric power, known in France as the "Mixte." The car Fournier brings is one of the original lot made by Lohner & Porsche, of Vienna, who have since sold the patent rights to Panhard & Levassor. A gasolene engine of 28 horse power drives two dynamos, and the electric motors are so much a part of the front wheel hubs that no chains or gears of any sort are necessary. The Frenchman thinks this car will make a hit here. It is started by a switch, and has a speed of forty-eight miles an hour.

Fournier's press agent challenge to Winton was seized upon with avidity by the saffron journals and telegraphed by the papers to Winton, who replied that he was too busy. It was plain that Winton knew better than to take it seriously. Naturally Barney Oldfield was next turned to, in order to continue the story.

Incidentally Fournier mentioned that he had not received the cup for his mile in 51 4-5 second on the Coney Island Boulevard. Incidentally, also, it is mentioned by an official of the Long Island Automobile Club that the club never has received Mr. Fournier's entry fee for that contest.

Date Set for Paris-Madrid.

The date for the Paris-Madrid automobile race has been fixed for May 24.

The Automobile Club of France will begin receiving entries on January 15, which will be continued up to April 15, after which date the fee will be doubled. The final closing of entries will be on May 15.

The Automobile Club is organizing a competition for improved timing apparatus and will give a prize of one thousand francs and medals. Apparata must be submitted to the club by February 9.

SCARITT ENTERS THE TRADE

Becomes President of the Pan-American Co.—His Election in Nature of a Surprise.

One of the most interesting pieces of news of the week came out Wednesday, when it was announced that Winthrop E. Scarritt had been elected president of the Pan-American Motor Co., makers of the Panam cars.

As was told in the Motor World last week, this company has been undergoing something of a reorganization. The capital stock has been increased and the machinery and tools of the Automobile Company of America purchased. The capital was raised from $100,000 to $500,000, and James E. Woodbridge, formerly with the Pratt & Whitney Co., Hartford, Conn., was made vice-president and general manager. It was not generally known, however, that Mr. Scarritt was even a stockholder in the concern until the announcement of his election to the presidency was made.

The Pan-American Co. was organized early in 1902 with A. C. Bostwick as a stockholder and supposedly the possessor of the controlling interest. Its product for the first year was small, and it has attracted little attention, but from the recent proceedings it is evidently to be reckoned upon in the future as an important factor in the industry.

The new president carries into the office the sagacity, alertness and nervous energy of a successful Wall Street man. He is one of the members of the brokerage firm of Chapman & Co., of No. 80 Broadway, New York. Besides being a wide awake, practical business man, Mr. Scarritt will have the advantage of a broad acquaintance with the automobile pulse of the public and an intimate knowledge of the prevailing sentiment. This he has acquired as a practical automobilist who has been actively identified with the development of the motor vehicle both in its sporting and social uses. He is one of the governors of the Automobile Club of America, has served on various committees, and is president of the American Automobile Association. It would be difficult to pick a man better qualified to direct the policy of an automobile manufacturing concern.

Smith Heads new Company.

One of the latest comers in the automobile field is the Premier Motor Mfg. Co., which has been organized at Indianapolis, Ind., with a capital of $50,000, to build gasolene cars. The moving spirit in the enterprise is Harold O. Smith, until recently vice-president of the G & J Tire Co., who becomes president and manager of the new company. Matters are in such a forward state that it is expected that a car will be ready for exhibition at the Chicago show.

Whipple Gets a Cup; Also Adams.

It was a jolly and congenial party that assembled at Café Martin last Saturday night, the occasion being the presentation of a silver loving cup to Harlan W. Whipple in commemoration of the New York-Boston reliability run and as a slight token of the esteem and affection in which that prince of good fellows is held. Winthrop M. Scarritt was toastmaster, par excellence, of course, and many and felicitous were the remarks that went round the board.

The surprise of the evening came when W. J. Stewart, in a witty speech, presented George B. Adams with a burlesque cup, a large porcelain one, with a handle on one side only. This gift quite overwhelmed Mr. Adams, who insisted, however, that it be filled and passed around, as had been the case with "Whipp's" cup, which was finally done amid much amusement.

Those present beside Mr. Whipple were Edgar R. Reets, Charles McK. Looser, George B. Adams, William H. Remick, J. E. Knobland, Richard A. Streit, A. J. Rice, W. J. Stewart, J. B. Stewart, E. E. Schwarzkopf, T. M. Hilliard, Roland R. Conklin, Angus Sinclair, Winthrop E. Scarritt and Frank W. Roche.

Receiver for German-American.

John C. Coleman was on Tuesday appointed receiver of the German-American Automobile Co., upon the petition of its treasurer, James McNaughton.

There has been a quarrel among the officers and directors and litigation has resulted in order to determine the rights to the possession of the books and other assets. The issues were tried before Francis K. Pendleton, as referee, and he has made no report.

According to the petition of the treasurer, the assets include a finished automobile, valued at $2,500, and a quantity of parts of machines. The company has temporary offices at No. 25 Broad street, New York. William H. Brearley is president, Thomas H. Gillespie, secretary. It made a gasolene car, but had never got much beyond the experimental stage.

Kimball and Fournier Complete Deal.

It was announced on Tuesday that a deal had been consummated between Fournier, of the Paris Automobile and the Central Automobile Co., of No. 1,684 Broadway, New York, whereby the latter will hereafter be the exclusive representative in America of the Paris concern, which deals in Mors, Mercedes, Renault and Panhard cars. This deal was begun in Paris when E. T. Kimball, of the Central company, was there, and only the final terms of the contract remained to be completed here. Two Mors cars that were at the Paris show are to be exhibited by the Central company at Madison Square Garden, while Fournier will show the special styles brought over by him, and the New York firm and the French one will work in harmony.

BIG ORDER FOR RIG CARS

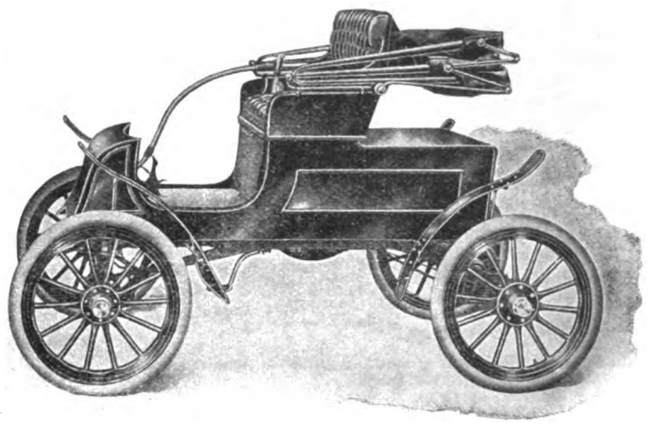
Wanamaker Shows his Faith by Placing a Six-Figure Contract for Searchmonts.

It was the privilege of the Motor World man last week to see a contract executed between the Fournier-Searchmont Automobile Co., represented by W. D. Gash, general manager, and John Wanamaker, which is unusually interesting for several reasons. In the first place, it was probably one of the largest bona fide contracts for big cars yet placed in this country, and illustrates the extent to which one large mercantile establishment is going into the business and the faith reposed in the Searchmont car, which has been selected as the leader.

Not less interesting is the fact that the contract is absolutely "clean." It calls for no accessories or sundries whatever, being a straight agreement to take over $100,000 worth of automobiles in a given time under the regular warranty of the N. A. A. M., and expressly stipulates that no sundries or extras are to be included. The responsibility of the manufacturers ceases with the placing of the goods on board the cars at the factory.

In addition to the contract named above a supplementary option for a large number of machines, almost identical with the contract, with the exception that it leaves the purchaser free to cancel the second order before March 1, shows that the Wanamaker establishment expect to dispose of even more machines than the large number contracted for. It is encouraging to the automobile industry to note facts like the above, and, of course, a large sized feather in the cap of the newly appointed manager of the Searchmont Automobile Co.

Chance for Remington.



There appears to be a good prospect that the business of the Remington Automobile & Motor Co. will be continued. At a meeting of the stockholders, held last week, reports were made as to the inventory and as to the attitude of the creditors. The two largest creditors were present. It seems practically assured that the creditors will consent to a reorganization plan, and the stockholders present voiced their approval by vote. The whole matter was discussed at length, and a very thorough understanding reached. It was voted to direct Charles H. Searle, as attorney, to draw up the necessary legal papers for stockholders and creditors to sign. As soon as they are ready they will be circulated.

Porter Battery Again Beaten.

In a decision handed down last week the United States Circuit Court of Appeals again sustained the Brush storage battery patent, owned by The Electric Storage Battery Co., and affirmed the injunction granted by Judge Hazel of Buffalo againt the Porter Battery Co.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, JANUARY 15, 1903.

This Show and the Next One.

The show's the thing.

There have been other shows, but none so thoroughly "the thing" as this one. No display that has gone before is comparable with it, and with every available inch of exhibition space occupied, it is difficult to imagine how there can ever be a greater one.

If the show is to become an annual fixture, either exhibits must be contracted, Madison Square Garden enlarged or the scope of the affair altered. From certain viewpoints the latter is the best way out of the difficulty, as we believe will gradually dawn on those most concerned.

A. A. A., A. M. L. and A. C. A.

During next week the American Automobile Association and the American Motor League both will hold their annual meetings. Each has issued an appeal for support, that of the A. A. A. being pitched in a particularly high key.

Both organizations might, however, profitably ask themselves what they have done and purpose doing to merit the support which they seek. If we view their respective records of the past year we find that all that the Association did was to indorse the oft-mooted scheme of a transcontinental highway, while the League fought the case of an automobilist on Long Island.

The objects of both organizations are the same. One stands merely for the clubman, the other for the automobilist at large. What is good for the one individual is, however, good for the other. A scattering of fire and division of energy does not serve to bring about effective accomplishment.

To our mind there is room for but one organization, and short of the amalgamation of the League and the Association neither is likely to amount to the proverbial row of pins. Nothing is gained by disguising the fact or closing one's eyes to it. One able bodied organization is better than two lame ones, such as now exist. False pride or narrow views should not be permitted to block the way.

More than this, and whether or not an amalgamation is brought about, it is necessary if either the League or the Association, or both, is to serve its purpose, that an understanding be reached with the Automobile Club of America. Despite its name, the club is essentially a New York body, but one that undeniably occupies the centre of the national stage. It has largely taken to itself the promotion of events and conduct of affairs that more properly come within the spheres of the A. A. A. and the A. M. L.

That the A. C. A. will relinquish its place at the footlights is difficult of belief, but that does not affect the fact that the League and the Association must overcome their listlessness and live more than a nominal existence if they are to grow and prosper and command the attention and respect of the public.

Some Men on Some Stands.

At previous shows there has been a great deal of dissatisfaction expressed at the attitude of no inconsiderable number of stand attendants.

These lordly gentlemen appear to be under the impression that they are paid to look pretty, to ogle all the attractive looking girls who come within their purview, and to rebuke the temerity of people who come to them for information regarding the cars shown on their stands.

Some of them are incompetent, others merely indifferent. Which is the more aggravating it is not altogether easy to say; but certainly both types are unprofitable. The man who does not know anything about the internals of the cars he is supposed to extol, and is therefore unable to perform his part of the contract entered into between his employer and himself, has a reason for his unprofitableness, if not an excuse. But his companion who is better equipped, and yet makes no better use of his knowledge, is more blameworthy at least. "The bird that can sing and won't sing should be made to sing."

Now that the automobile industry has settled down to businesslike ways, and the spreadeagleism of past years is no longer in evidence, it is fitting that the evil complained of should be eradicated also.

There was less complaint at the last show than at the one of 1900. A further improvement would be both timely and welcome.

The Commercial Vehicle Contest.

Nothing more sensible nor of more vital interest to the automobile industry at large has been done of late than the decision of the Automobile Club of America to arrange a contest for commercial motor cars. It is to be hoped that the manufacturers of such vehicles and the owners of them will see the value of the proposition and respond freely to the invitation to come forward with suggestions.

As the commercial draught vehicle is in the main employed for city traffic, it will at once occur that any contest which leads the cars simply over a stretch of rural road would not be eminently satisfactory. What the merchant wants to know about draught automobiles is how much more work they will do than horses and at what cost. The efficiency of a truck or delivery wagon in the city depends to a certain extent upon the facility with which it can be stopped and started in crowded streets, and upon the ability of its driver to make the most of the opportunities that offer.

In consideration of these things the idea suggests itself that a part of the course the metropolis. In order that all might find the same or similar conditions, the city part of the course should be covered first, should include some of the busy streets of as otherwise the competitors would be apt

Digitized by Google

to be straggling through at different times and not find the same volume of traffic.

This plan, while desirable, is open to some serious objections. One of these is that on a working day, when the streets would afford the conditions for a good test, the owners of delivery wagons and trucks would need them in their business and be unable to spare them for any contest. As the manufacturers of such vehicles have not yet reached the stage where they have stocks on hand, but are building to order, it is natural to suppose that vehicles in actual service would have to be borrowed by the makers for the contest or else entered by the firms owning them. This would perforce compel the committee to hold the contest on a holiday. Another objection that might be raised to the plan of running through city streets is that a number of contestants would of themselves crowd the thoroughfares so that the test would not be one made under normal conditions. If the competition was held on a holiday this objection would lose its validity, and at any rate the idea of including streets having different sorts of pavement, instead of a plain macadam road, is one that would, if adopted, make the fairest all around test.

A well known firm of brewers that has adopted some electric trucks recently made tests for its own information, and found that the motor wagons could carry a bigger load and make a trip three times a day over a certain route that the horse drawn trucks could cover only once. This was a test of the most practical sort. It yielded just the information desired, and all that remained for the brewery firm to do was to figure out the difference between the maintenance, cost of horse trucks and the motor moving ones and then determine their relative value in work accomplished by rule of three.

This test suggests another thing which it would be well to do, but which unfortunately would involve a great deal of trouble and carry the contest committee into complications beyond its scope. The idea suggested is that of having the motor vehicles competing compared by practical test with horse drawn trucks, load for load and distance for distance. The superiority of the self-propelled cars would make a lasting impression if this could be done. And it might be. It would require only one horse drawn vehicle of each class, say, four or five, to show what they could do under the same conditions as the automobile.

Whatever is decided upon, the rules fixed should be such as would bring the vehicles into competition under practical work-a-day conditions. Such a test can be made of great practical value, a help to those hesitating between the horse and the horseless truck, and an encouragement to what in the future is certain to be the most substantial part of the automobile industry.

Good Roads and the Brownlow Bill.

All the world agrees that good roads are good things and deserve to be pushed along. But when it comes to the how and why—by whom the pushing shall be done and in just what manner—differences at once arise and ardor cools perceptably.

Theoretically all good citizens are in favor of road improvement. Even the farmers—those close-fisted sons of toil who formerly viewed the movement hostilely, seeing in it only a design on their pocketbooks—have come round and are taking a saner and more sensible view of the matter. A little practical demonstration of the benefits to be derived from broad, smooth and solid highways has brought about their conversion.

But in spite of the fact that a beginning has been made, it is only too plain that it is the feeblest of feeble beginnings. Our country is huge, its area vast, its distances stupendous. To link State to State, city to city, village to village, as has been done by the steel rails, and as must be done by stone highways before we can really round out our civilization, is a Titanic task, but one to which we must resolutely address ourselves, and the sooner the better.

A simple, comprehensive and wise plan to this end is contained in the Brownlow bill, now before Congress. It sets on foot a systematic agitation for good roads, devises ways of insuring that they will be right, and, most important of all, provides some of the means for obtaining them. Even twenty millions of dollars is an insignificant sum—a mere drop in the bucket—compared with the milliards that must eventually be expended for the purpose, but it serves to start the ball to rolling, to dignify the undertaking, to insure the continuance of the movement once it is inaugurated.

The bill has been widely and favorably noticed. There is strength behind it, and but little opposition. To crystalize the former and bring it to bear in some concrete and effective form, so that it will impress our legislators with a sense of its force and reason is the task now before us.

To its performance all friends and advocates of decent highways—and they certainly include all automobilists—should devote their energies.

Aid in Instruction.

It would seem to be a good plan for firms who make a specialty of giving lessons in driving to fit the cars used for instruction purposes with duplicate pedals and brake lever. The instructor, sitting by the side of the novice, can always correct the steering, if necessary, but there are times when the safety of the car and its occupants would be considerably increased if he could also apply the brakes.

The time when this sort of control would be so valuable would be just after the tyro had begun to think he could drive. Many when they have learned to steer and to work the pedals and to change the gears are apt to think that they have acquired the whole art of driving, and instead of jogging along quietly for a few days till every action becomes automatic, they put on the pace very early in their career. Luckily, they usually scrape through all right, but they are very apt to forget at the critical moment some vital action, such as the depressing of the brake pedal or the application of the side brake, or, at any rate, they do not take instant steps to check the car, and an appreciable amount of time is lost in doing what they should instantaneously do. This is where the prompt action of the instructor, with his duplicate pedals and brakes, would be of the greatest service.

Of course, this duplicate control should only be reserved for teaching, as it would be worse than useless if fitted on an ordinary car.

It is the eve of the battle of the types. American and European, gasolene and steam, vertical and horizontal engine, motor front and motor back—these and a dozen other battles are about to be fought out once more. And the types are getting so inextricably commingled that it is no longer an easy matter to tell t'other from which at first sight.

For nigh one hundred years rails have absorbed all the energy and money the people of this country were able or willing to devote to the development of wheeled vehicles. Turn about is fair play, and the automobile bids fair to set fairly in motion a movement that will not halt until public stone roads rival those private ones of steel that are the marvel of the century.

THE FORESHADOWS OF THE SHOW

GREAT GROWTH OF THE INDUSTRY WILL BE MADE EVIDENT, BUT NO MARKED TENDENCIES, DEVELOPMENTS OR INNOVATIONS ARE IN PROSPECT—RADICAL ALTERATION IN BODY DESIGN OF TWO STEAM CARS ONLY APPROACH TO THE SENSATIONAL—GASOLENE DOMINANT AND FOREIGN INFLUENCE STRONG—WHO'LL BE THERE AND WHAT THEY'LL DISPLAY.

When, on Saturday night, for the third time, the doors of Madison Square Garden open for an automobile show, it will be seen that the industry had been shod with Seven League Boots, and has made all possible use of them during the past year and a quarter.

No evidence of material prosperity and progress will be found lacking. The show is a bigger and better one than would have seemed possible in the earlier stages of the business. The huge building that has housed so many imposing exhibitions, and that is the city's show place par excellence, has thus early been found inadequate for the accommodation of an industry that is still in its infancy. By dint of going upstairs and down—the boxes and the basement being alike levied upon—the influx of exhibitors has been provided for in some fashion. But what of next year, and the ones to follow?

It has taken only three years for this congested condition to be reached. The first show, held in 1900, was a tentative effort, no one being quite sure that the industry had advanced sufficiently to warrant such a show or make it successful. There were but 28 manufacturers showing, and of the number 8 had withdrawn from the field within a year. Nevertheless, these 28 concerns, with a fair sprinkling of parts and sundries people, made such a good showing, and the innovation was received with such favor, that the experiment became at once a permanent institution.

Although the next show, that of 1901, did not undergo any remarkable increase in size, there being but 36 makers represented, an increase of but little more than 25 per cent, it settled definitely, the matter of shows. They were to be continued; that was certain. The date was pushed forward from November to January, and the management vested in the N. A. A. M., the A. C. A. and the Madison Square Garden Company, thus securing united support.

Figures best show the tremendous growth that has taken place in exhibitors at this year's show. There are 76 makers, or their representatives, showing complete cars, an increase of over 100 per cent. Of these one shows electric, steam and gasolene cars; one electric and gasolene, seven electric, twelve steam, and sixty gasolene. In addition, there are ten concerns showing tires, and fifty-seven showing fittings, supplies, sundries, etc. In all the exhibitors number 143.

There is cause for both regret and congratulation in the fact that the present show more than any other has had its principal novelties described and illustrated, and sometimes exhibited, in advance.

Some of the cars were kept inviolate until the immediate pre-show time; then the secrecy was withdrawn and the public given a view of the new models. The White and Grout steam cars—both of them little short of revolutionary in their design—are conspicuous examples of this. Many others, including a considerable number of gasolene cars, have been shown or described in the regular way, and their chief features made known.

In consequence of this unusual publicity, those who attend the show will go there with some knowledge of the majority of the cars, and with the intention of making a closer examination. Their task will be, not so much to learn what is new, as to examine that which they are already partly acquainted with. If the freshness of their appetite is gone, the preliminary glimpses of what is to be shown have made them more discriminating and, in some cases, intelligent. At the same time this publicity has advertised the show and aroused curiosity that can only be satisfied when the doors open on Saturday night.

Fixtures of the Week.

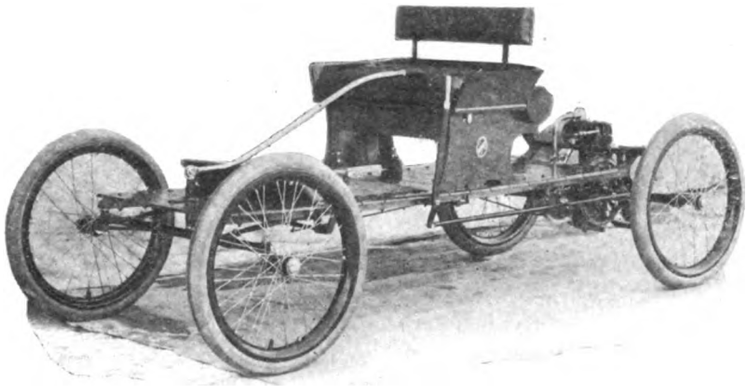
Tuesday, January 20—Annual meeting American Automobile Association.
Thursday, January 22—Annual meeting American Motor League.
Thursday, January 22—Automobile Club of America meeting with manufacturers of commercial vehicles.
Friday, January 23—Annual banquet National Association of Automobile Manufacturers.
Saturday, January 24—Annual meeting National Association of Automobile Manufacturers.
Saturday, January 24—Annual banquet of the Automobile Club of America.

To assume, however, that there will be no novelties—nothing that has not already been exploited—is to go much too far. Inquiries made reveal a number of unexpected changes, hints of which are given in the appended stand-to-stand forecast. Late as the show is, by comparison with previous ones, it comes too early for some makers, and models have been rushed through for it or the effort to get them here in time abandoned. There is little reason to doubt, however, that there will be many genuinely interesting cars in addition to those already noticed.

Outside of the cars themselves there is a vast field, and one almost entirely uncanvassed. For the intelligent worker in it there is certain to be found in the many exhibits of fittings, sundries, etc., much that will repay study.

In the present show there are but twelve steam makers, or practically the same numbr as were found at the last show, although the number of makers in the present exhibition has more than doubled.

But this is far from being all. Five of these twelve steam makers also manufacture gasolene cars, viz., International, Century, Stearns, Conrad and Locomobile, and a sixth, Mobile, is at work on one. With one exception, the International, all these concerns have added gasolene cars since the last show. Furthermore, three steam makers showing previously, Steamobile, Steam Vehicle Co. and D. B. Smith & Co., have retired from business, and a fourth, Overman, has virtually followed suit.



Damaging all this is, but it must be admitted that it quite overshoots the mark. The steam vehicle industry is not in such a parlous state as this would indicate.

While conceding this, it would be useless to attempt to conceal the fact that the last year has witnessed giant strides on the part of the gasolene car. It was the fashion then. It is even more decidedly the fashion now. The public evinces a great liking for the gasolene type of car. Makers see this, and, after a more or less strenuous resistance, bow to the inevitable and make, or

Digitized by Google

prepare to make, gasolene cars. That is the upshot of it. Whether the tide will continue to run just as strongly in this direction or in time ebb is another matter. There may be predictions, but no one can speak with certainty. There is nothing to do but to wait.

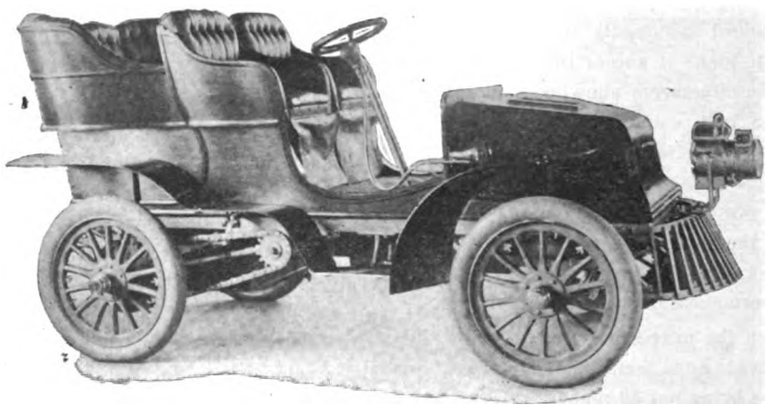
Unlike the steam branch of the industry, that devoted to electric vehicles has prospered in every way. Those exhibiting at the show, seven in all, include one newcomer, the Studebaker. Covering a field entirely distinct from that in which the gasolene car finds a place, the vogue of the latter has not been disturbed at all.

THE WALTHAM BUCKBOARD.

Viewing as a whole the vehicles to be shown at Madison Square Garden, it is apparent that they cover a much wider range than ever before. There are lower priced cars, as witness the new Waltham at $500, as well as more costly ones, the extreme in this direction being the Electric Vehicle Co.'s gasolene car, priced at $5,000, while cars at $3,000 and $4,000 are not at all unusual. But at the same time the popular priced cars—ranging in price from $500 to $800—have increased in number and form one of the features of the show; not, indeed, to the same extent as at Chicago last March, but still one that will stand out prominently.

Weights have undoubtedly undergone a still further increase, although the Waltham car, in addition to being the cheapest, is also the lightest in the show, scaling but 350 pounds. But steam and gasolene cars have been strengthened almost invariably, and frequently given more power.

Coming to the cars themselves, the steamers undoubtedly bear off the palm in point of novelty, even sensationalism. The White steamer, with its gasolenelike exterior, has already been described and illustrated in these columns. A fitting companion to it is the Grout steam tonneau, now shown for the first time.



A rectangular frame of heavy angle iron supports the boiler placed forward under a bonnet, and an engine positioned horizontally under the foot board. The power is transmitted to a jackshaft containing compensating gear, thence to the rear wheels by chains. This construction permits the use of a dead axle of very heavy construction, and a dish to the rear wheels similar to that on the front ones.

The car is equipped with a condenser, rendering it possible to run with but 10 or 15 gallons of water, although provision is made for a capacity of 53 gallons.

The gasolene tank is large, and the appliances include a steam air pump, steam water pump, forced draught, and water lift. The system of control is very good, and powerful brakes on rear wheel drums are fitted. The wheels are of the artillery type, with 32x4 inch tires and plain bearings.

The tonneau body is designed to seat five persons comfortably, and is upholstered in leather, with brass trimmings throughout. The car will take the steepest hills, and run at a very high rate of speed.

In addition to the White and Grout, the Toledo steam car is for the first time fitted with a condenser. By the use of a device of this kind wonderful economy with the water supply is obtained, and the inconvenience of having to fill the tank every few miles is obviated. The Toledo condenser is said to have been exhaustively tested and found to be all right.

GROUT'S NEW STEAM CAR.

The White touring car has a shaft and bevel gear drive; the Mobile has a new burner which is highly spoken of; and the Toledo has what is rather vaguely described as a new body on gasolene lines.

As was seen a year ago, the tendency to follow the design in almost universal use abroad for gasolene cars is still in evidence. The long wheel base, the bonnet in front, the wheel steer, the tonneau body—these are seen on probably a majority of stands. They may fittingly be termed the gasolene car type. Except in the case of the light runabout, which is really the distinctive American development evolved to date, the type mentioned is copied and acknowledged to be that wonderful thing "the fashion."

But it is frequently followed more in appearance than in reality. An inspection will frequently reveal that the bonnet is an ornament or a receptacle for water or gasolene tanks, as in the F. B. Stearns car, or that a horizontal instead of a vertical engine finds a place there, as in the Autocar.

In short, although the vertical motor is found on a number of cars that formerly owed allegiance to the horizontal type, the latter still finds more favor than was generally expected. A few of them are single cylinder, more are double. But the horizontal engine still has a commanding lead, and at the present rate it will take more than one year longer to oust it.

Cars like the International, the Peerless, the Berg, the Stearns, the Pope-Robinson, the Searchmont and the Moyea represent the foreign type, so called. These are costly, comfortable, substantial, the apogee of advanced constructional ideas. They contain many clever and ingenious devices and features, but outside of one or two square front, Mercedes type, bonnets, the exhibit shows no evidence of the Germanizing tendency so evident at the Paris show.

At the other extremity, with cars like the Olds, the Crest, the Rambler, etc., even greater simplicity has been sought after. Such are the diverging lines along which makers work.

One of the real novelties of the show will be a 350-pound two-passenger vehicle, listed at $500, and simple to a remarkable degree. It is the product of the Waltham Mfg. Co., and is termed the "Buckboard." The illustration gives a good idea of this automobile in miniature.

As the makers point out, the vehicle is the very simplest, lightest form in which it is possible to construct a motor vehicle. The power mechanism is as devoid of complexity as a motor bicycle or tricycle, notwithstanding which the Buckboard seats two persons side by side.

The motor is 4 horse power, and is air

Digitized by Google

cooled by a very ingenious blower working directly on the motor shaft. The vehicle can be driven at all speeds from 4 to 30 miles an hour by a slight change of pressure on the foot throttle and movement of the spark lever at the left of the seat. It will climb hills up to 17 per cent. with two persons, and is in every way one of the most practical, and probably the lightest power vehicle in the world, the entire weight being only 350 pounds.

The vehicle has an exceedingly long wheel base, and the flooring or buckboard frame is very long and flexible, making it most luxurious. It is finished mostly in natural wood, highly polished, with maroon enamel and nickel plated trimmings. In fact, the machine throughout is a very rakish, stylish looking rig, splendidly adapted for every purpose where a fast, light mode of conveyance is required.

Although most of the exhibitors have "declared themselves" concerning what they will have at the show, it is natural to expect that a few surprises will be sprung, particularly by concerns hitherto unknown. Two of the novelties already known about are an electric runabout in miniature and a new style of steam fire wagon.

The electric vehicle is the property of George Gould's son, and will be exhibited by Cole & Woop, carriage makers, of No. 48 West Sixty-seventh street, New York, who built the body of the car. The clever little machine is only six feet long, four feet in height and three feet in width, but it will run twenty miles on one charge.

The fire wagon is the latest product of the International Fire Engine Co., Elmira, N. Y., and is a remarkable construction. It is not an engine such as is used to pump water through a fire hose, but is more in the nature of the salvage wagons run by the insurance patrol. The body of the wagon has seats on the side and a steel basket for axes and other implements. On each side is a brass cylinder about five feet long and a foot and a half in diameter, in which is stored under pressure a chemically made extinguishing fluid. At each end of these cylinders is a coupling for a hose.

The wagon has a steam engine, and is chain driven. There is a steam chest and pistons and a chain on each side, and it is said that a speed of seventy miles an hour can be attained by the wagon. The chassis is of steel throughout, and sustains in the rear the water and gasolene tanks. The boiler is in front, and hangs from the upper frame of the wagon. The wheels are only twenty-eight inches in diameter, of artillery pattern, extra heavy, and are fitted with two-inch solid rubber tires.

Until the show opens the display of fittings, accessories, etc., is an unknown quantity. There is much that is both new and meritorious, but it remains for the patient investigator to discover them on the spot.

There is no reason to doubt that such will be the case this year. Several kerosene burners—that much sought adjunct to the steam car—are announced, while gasolene burners have not been overlooked, such concerns as Forg, Kelley, etc., having improvements to show.

Commercial vehicles will be found to have made considerable headway. While this is true as to the delivery wagon class, as shown by the White and other productions, it is much more so of the heavier vehicles. The Electric Vehicle Co.'s truck is a marked example of this. Both makers and public are giving this matter more attention, and the difficulties incident to the operation of the vehicles are being more fully met than in the past.

There will be much that is new in the motor bicycles shown. Several, notably the Merkel and the Thomas, have been much changed, a spring frame and fork and a cushion frame having been adopted.

Summary of Exhibits and Exhibitors.

MAIN FLOOR.

Spaces 59 to 61—The Mobile Co. of America. New York—Eleven mobile steam cars, viz., special runabout, standard runabout, dos-a-dos, light surrey, heavy surrey, touring car, light delivery wagon, wagonette delivery, wagonette, coupe and victoria, the last three being entirely new models. Also parts and specialties. A new burner has been adopted. It has a flattened cylindrical chamber, pierced vertically by many one-half inch steel air tubes expanded into the tube plates in the same manner as in the boiler. Placed at intervals between these tubes and screwed into the top plate are numerous perforated raised steel tips. These tips elevate the flames above the top plate, and consequently prevent the overheating and warping of the plate and the burning off of the air tubes. Burners of this description are very economical.

The use of an automatic water level regulator and low water signal renders a water glass unnecessary. A steam air pump maintains pressure on the gasolene tank.

Space 62, Foster Automobile Co., Rochester, N. Y.—Foster steam automobiles.

Spaces 63 to 65, the Peerles Motor Car Co., Cleveland, Ohio—Peerless gasolene cars. Features, square bonnet and new style radiating tubes; transmission by universal shaft and bevel gears, hardened and mounted on ball bearings; the differential and bevel pinion are also mounted on ball bearings. The two cylinder vertical engine now develops 16 H. P. at 800 R. P. M.

Spaces 66 and 67, Packard Motor Car Co., Warren, Ohio—Packard gasolene cars. A new style of body has been adopted. The large single cylinder horizontal motor develops 12 H. P. and the transmission is of the sliding gear type, giving three speeds forward and a reverse.

Space 68, the C. J. Moore Mfg. Co., Westfield, Mass.—Westfield gasolene touring cars in three styles, 8, 12 and 16 H. P., respectively, fitted with two cylinder vertical motors. Loomis Automobile Co., Westfield, Mass.—Loomis gasolene cars. Features, a transmission that makes it impossible to clutch two gears at once, new cooling system, non-variable carburetter.

Space 69, Meteor Engineering Co., Reading, Pa.—Meteor steam cars.

Space 70, the Automotor Co., Springfield, Mass.—Automotor gasolene cars. These cars are of the tonneau body type, with vertical engine positioned in front under a bonnet.

Spaces 71 and 72, Olds Motor Works, Detroit, Mich, Olds gasolene runabouts.—The horsepower has been increased from four to five, wooden wheels substituted for steel ones, a new carburetter, a new and roomier body and stronger axles fitted. The single cylinder, horizontal motor has been retained, together with the Olds longitudinal leaf springs and other characteristic features.

Spaces 73 to 76, International Motor Car Co., Toledo, O—Toledo gasolene and steam cars and Waverley electrics. The gasolene cars are made in three models, 12, 18 and 24 H. P., respectively, fitted with 2, 3 and 4 cylinder vertical motors. A new governing system, working on a throttle in accordance with the best foreign practice, copper water jackets (on the 24 H. P.), a new radiating system, a general refining of details and an improved tonneau, with third seat in the back, are the principle features.

The Toledo steam car has been much changed, the particulars given out only whetting the appetite for more. A condenser designed on scientific principles is used for the first time. With it back pressure is entirely eliminated, even in going up hills, and a run of 38 miles has been made on one gallon of water. A new flexible frame and a new body, the latter being similar to that employed on gasolene cars, have also been adopted.

Spaces 77 and 78, Pan-American Motor Co., Mamaroneck, N. Y.—The Pan-Am. gasolene car, a 4-cylinder, vertical engine vehicle of approved modern design.

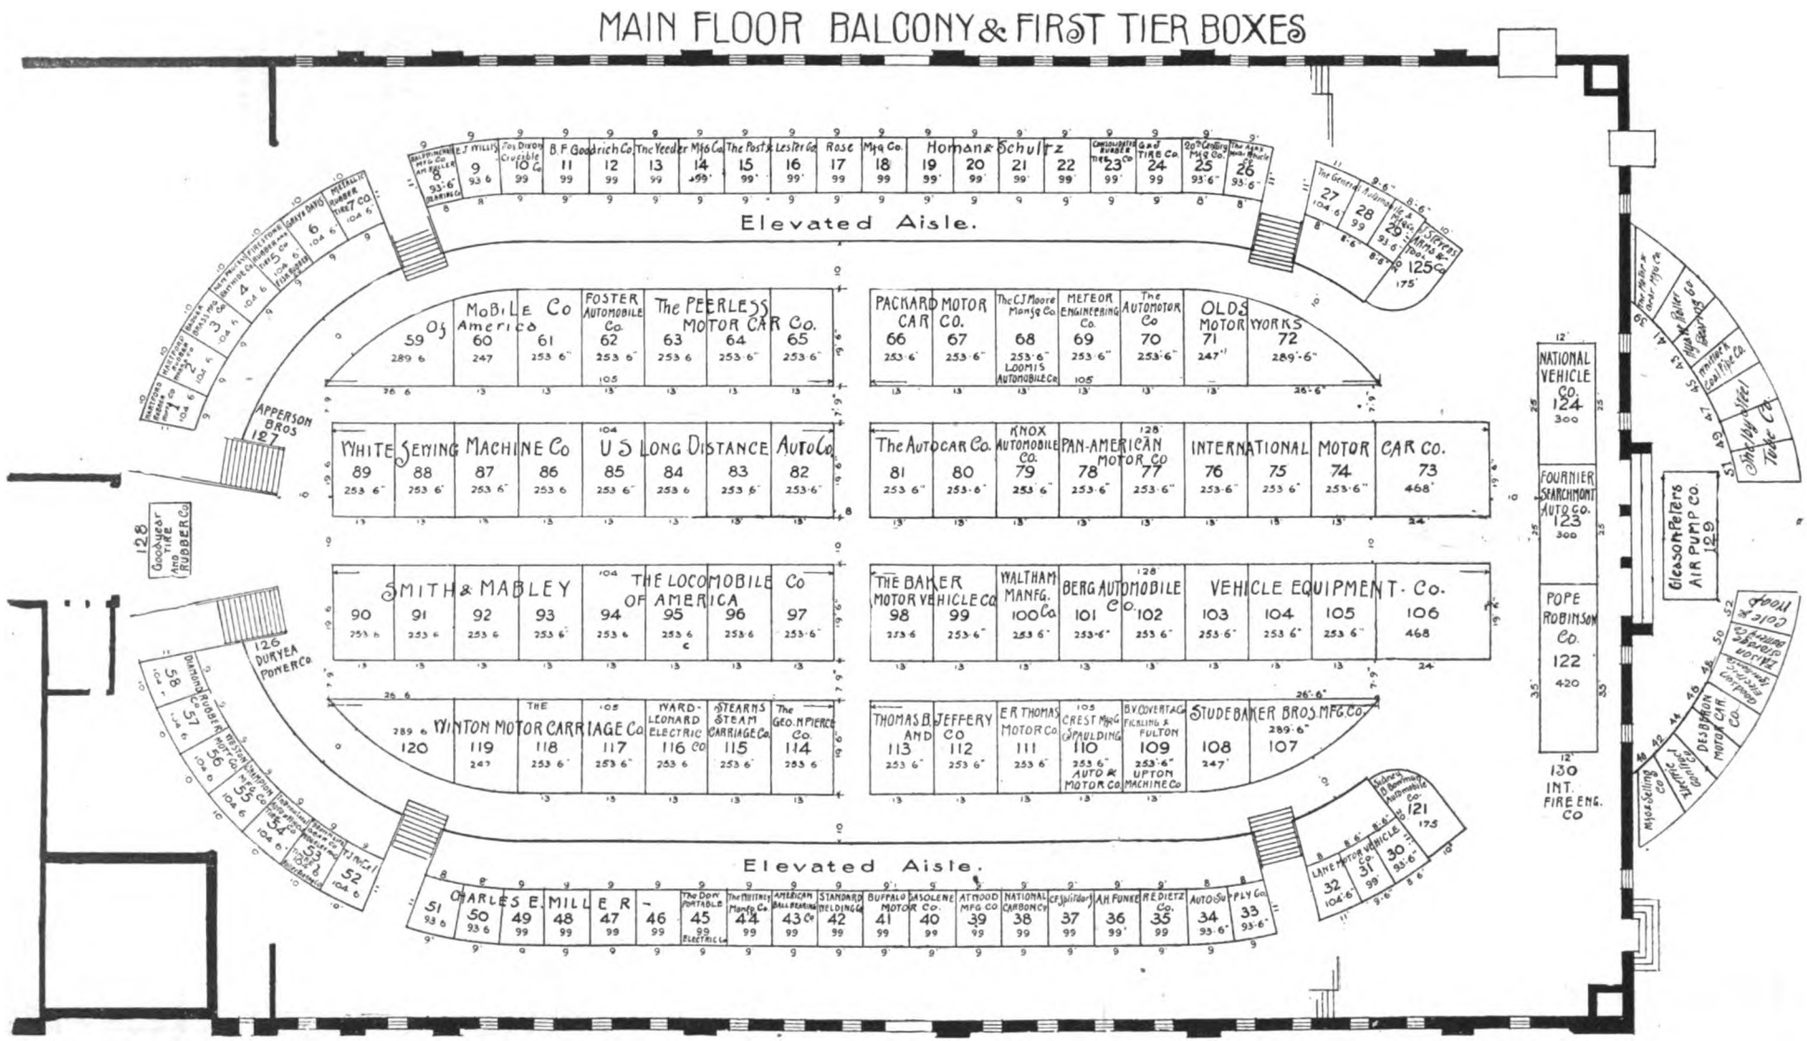
Space 79, Knox Automobile Co., Springfield, Mass.—Increased power and strength, a longer wheel base and wood wheels mark the Knox gasolene car. The single cylinder, horizontal air-cooled engine, with a fan as an auxiliary cooling device, has been retained.

Space 80, The Autocar Co., Ardmore, Pa.—Autocars, gasolene, have been much changed, the double cylinder balanced horizontal engine being retained, but placed forward under a bonnet of the usual type. Especial attention is called to the noiseless friction clutch and transmission gear, a positive pump drive for the water circulation, etc.

Spaces 82 to 85, U. S. Long Distance Automobile Co., New York—Long Distance gasolene cars are now equipped with 2-cylinder, horizontal motors and the planetary type of transmission, with bevel gear drive, gives three speeds forward and a reverse.

Spaces 86 to 89, White Sewing Machine Co., Cleveland, O—The White Touring steam car, an entirely new model, will be one of the features of the exhibition. In appearance it closely resembles the modern gasolene car, the engine being placed in front under a bonnet, the transmission being by shaft and bevel gears, and the body of the well known tonneau type. A compound engine, a condenser and the regulation White generator mark the car, while the lubricating and other automatic devices so well tested on the other White cars have been adopted in connection with this one.

Spaces 90 to 93, Smith & Mabley, New York—American C., G. & V., Panhard, Renault and other gasolene cars.



Spaces 94 to 97, The Locomobile Co. of America—Locomobile steam and gasolene cars.

Spaces 98 and 99, The Baker Motor Vehicle Co., Cleveland, Ohio—Baker electric vehicles, runabouts, imperials, stanhopes, etc. The beauty and distinctiveness that has always marked these vehicles has been even added to for the present season, and the combination of lightweight and ease of running is present to a greater degree than ever.

Space 100, Waltham, Mfg. Co., Waltham, Mass.—The Waltham buckboard, weighing 350 pounds and listing at $500, will be one of the features of the show. It carries two passengers, seated side by side, and is propelled by a vertical, air cooled motor.

Spaces 101 and 102, Berg Automobile Co., New York—Berg gasolene cars will be seen at the show for the first time. They are made in two models, 8 and 15 horsepower, respectively, and are of the multiple cylinder, vertical engine in front under a bonnet type, with sliding gear transmission. Features upon which special stress is laid are a new form of regulator, a mechanical lubricating device and a new control system.

Digitized by Google

Spaces 103 to 106, Vehicle Equipment Co., Brooklyn, N. Y.—Commercial vehicles, broughams, coupes, etc., electrically propelled.

Spaces 107 and 108, Studebaker Bros. Mfg. Co., South Bend, Ind—Four styles of electric vehicles, all with tubular underframes, with motors centrally positioned and with the Exide batteries carried in a compartment at the rear. Other features are the side steer, half elliptic front spring suspension and accessibility of running parts.

Space 109, B. V. Covert & Co., Lockport, N. Y.—Covert gasolene runabouts, with combined clutch and brake sliding gear transmission. Fickling & Fulton, New York—Covert gasolene cars. Upton Machine Co., New York—Upton transmission gears.

Space 110, Crest Mfg. Co., Cambridge, Mass.—The Crestmobile, which has undergone considerable change. The single cylinder air cooled motor is carrier under a hood in front, and is spring suspended; a direct shaft drive has been substituted for the chain formerly used, and the power has been increased from 3½ to 5 horsepower. Spaulding Automobile & Motor Co., Buffalo, N. Y.—Spaulding gasolene cars.

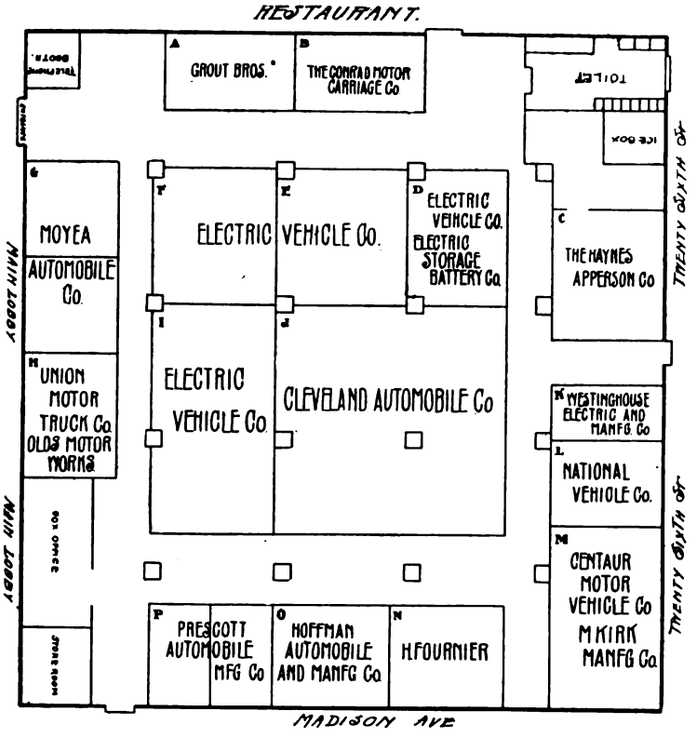
Space 111—E. R. Thomas Motor Co., Buffalo, N. Y.—Buffalo gasolene cars in two sizes, with hooded front, tonneau body, etc.

Spaces 112 and 113, Thos. B. Jeffery & Co., Kenosha, Wis.—Rambler gasolene touring cars have been fitted with wooden wheels of the artillery pattern, an auxiliary brake on rear wheel drums, a float feed automatic carburetter, a longer wheel base and an extra detachable seat carried on the bonnet. The ignition is controlled by an automatic governor. A single cylinder, horizontal engine developing 5½ horse-power is used.

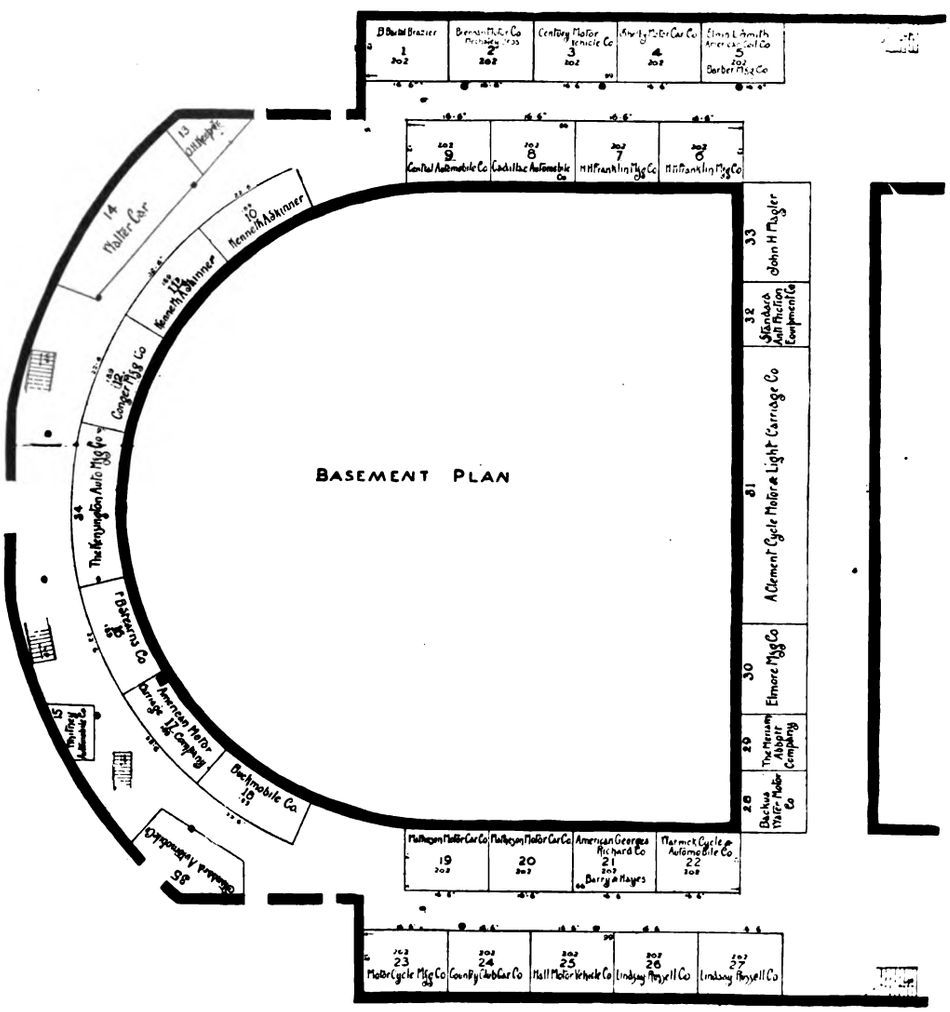
Space 114, The George N. Pierce Co., Buffalo, N. Y.—The Arrow and the Moterette, the former an entirely new car. A two cylinder vertical motor, positioned in front under a bonnet, furnishes the power. Simplicity of control is one of its characteristics, the accelerating devices being under the hand and the retarding ones under the foot.

Space 115, The Stearns Steam Carriage Co., Syracuse, N. Y.—Stearns steam and gasolene cars.

Space 116, Ward-Leonard Electric Co., Bronxville, N. Y.—Knickerbocker gasolene cars.



Spaces 117 to 120, Winton Motor Carriage Co., Cleveland, Ohio—Winton gasolene touring car, increased from 15 to 20 horsepower. The two cylinder horizontal motor, centrally positioned, is retained, and many improvements in detail have been made. The tonneau body is roomier and more comfortable.



Space 121, Sidney B. Bowman Automobile Co., New York—Panhard gasolene cars.

Space 122, Pope-Robinson Co., Hyde Park, Mass.—Robinson gasolene touring car, with a friction clutch for each speed, water cooled cylinder head and gravity gasolene feed.

Space 123, Searchmont Automobile Co., Philadelphia—Searchmont gasolene cars, with a two cylinder, vertical motor, with admission valves placed directly over the exhaust valves. The control is by means of a ball governor acting on the throttle at the carburetter, and so designed that it does not change the mixture.

Digitized by Google

Spaces 124 and L, National Motor Vehicle Co., Indianapolis, Ind.—National electric vehicles, many of them entirely new, and a new gasolene car.

Space 125, J. Stevens Arms & Tool Co., Chicopee Falls, Mass.—Stevens-Duryea gasolene cars of the two cylinder, horizontal opposed type of engine, with lengthened wheel base, larger axles and wider seats.

Space 126, Duryea Power Co., Reading, Pa.—Duryea gasolene cars, having a more elastic front running gear, better ignition, fittings, etc.

Space 127, Apperson Bros., Kokomo, Ind.—Apperson gasolene touring cars.

Space 128, Goodyear Tire & Rubber Co., Akron, Ohio—Single tube, detachable and solid automobile tires.

Space 129, Gleason-Peters Air Pump Co., New York—Tire pumps, gauges, cocks, whistles, etc.

Space 130, International Fire Engine Co., Elmira, N. Y.—Steam fire engines.

BALCONY.

Spaces 1 and 2, the Hartford Rubber Works Co., Hartford, Conn.—Hartford single tube, Dunlop detachable and Turner solid tires, together with rubber specialties, such as mats, etc.

Space 3, the Badger Brass Mfg. Co., Kenosha, Wis.—Solar acetylene automobile lamps in a wide variety of styles and prices.

Space 4, the New Process Rawhide Co., Syracuse, N. Y.—Noiseless rawhide pinions, etc.

Space 5, Fisk Rubber Co., Chicopee Falls, Mass.—Fisk single tube and Fisk detachable tires, vulcanizers, etc.

Space 5, Firestone Rubber & Tire Co., Akron, Ohio—Solid tires for carriages.

Space 6, Gray & Davis, Amesbury, Mass.—Automobile lamps.

Space 7, Metallic Rubber Tire Co., New York—Pneumatic tires with a metallic tread.

Space 8—Baldwin Chain & Mfg. Co., Worcester, Mass.—Baldwin patent chains for power transmission, both roller and plain. Also American Roller Bearing Co., Boston, Mass.; roller bearing axles, etc.

Space 9, E. J. Willis, New York—Automobile parts, fittings and sundries, including the Herz spark plugs.

Space 10, Joseph Dixon Crucible Co., Jersey City, N. J.—Graphite lubricants, graphite pipe joint compound, brazing crucibles, etc.

Spaces 11 and 12, B. F. Goodrich Co., Akron, Ohio—Goodrich single tube and detachable pneumatic tires for automobiles, light carriages, etc.

Spaces 13 and 14, The Veeder Mfg. Co., Hartford, Conn.—Full line of Veeder odometers, with attachments for all styles of cars.

Spaces 15 and 16, the Post & Lester Co., Hartford, Conn.—Automobile supplies and accessories of all kinds.

Spaces 17 and 18, Rose Mfg. Co.—Lamps.

Spaces 19 to 22. Homan & Schultz, No. 1,784 Broadway, New York—Northern Gasolene cars, for which they are the metropolitan agents. The car is a handsome one of the runabout type, seating two persons and propelled by a single cylinder horizontal engine centrally positioned.

Space 23, Consolidated Rubber Tire Co., New York—Solid tires.

Space 24, G. & J. Tire Co., Indianapolis, Ind.—The G. & J. detachable tire in a wide range of sizes.

Space 25, Twentieth Century Mfg. Co., New York—Twentieth Century oil and acetylene automobile and carriage lamps.

Space 26, the Ajax Motor Vehicle Co., New York—Ajax light electric runabout, having a single lever control and marked by the simplicity of its running gear.

Spaces 27 to 29, the General Automobile & Mfg. Co., Cleveland, Ohio—"General" gasolene runabout, a two cylinder balanced engine car, marked by simplicity and strength. All gears run in oil, and a mechanical force feed lubricator effectually cares for this important matter.

Spaces 30 to 32, Lane Motor Vehicle Co., Poughkeepsie, N. Y.—Three steam cars, one of

Digitized by Google

them being a new four passenger car. The Lane cars have been improved in detail, rather than by the introduction of new principles.

Spaces 33 and 34, Automobile Supply Co., New York—Supplies and fittings.

Space 35, R. E. Dietz Co., New York—Automobile lamps.

Space 36, A. H. Funke, New York—Kelecom motors and parts, lamps, bells, horns, etc.

Space 37, C. F. Splitdorf, New York—Splitdorf spark coil, spark plugs, etc.

Space 38, National Carbon Co., Cleveland, Ohio—Batteries.

Space 39, Atwood Mfg. Co., Amesbury, Mass.—Lamps.

Spaces 40 and 41, Buffalo Gasolene Motor Co., Buffalo, N. Y.—Buffalo gasolene motors.

Space 42, Standard Welding Co., Cleveland, Ohio—Electrically welded steel tubing for radiators, steel rims, etc.

Space 43, American Ball Bearing Co., Cleveland, Ohio—Ball bearing axles, wheels, etc.

Space 44, The Whitney Mfg. Co., Hartford, Conn.—Whitney standard roller chain for automobiles.

Space 45—The Dow Portable Electric Co., Boston, Mass.—Dow compound battery, induction coils, etc.

Spaces 46 to 51, Charles E. Miller, New York—Full line of automobile supplies, parts, fittings, accessories, etc., of domestic and foreign manufacture.

Space 52, Thos. J. Wetzel, New York—Parts, fittings and supplies, for which he is manufacturers' agent.

Space 53, The Midgeley Mfg. Co., Columbus, Ohio—Midgeley tubular steel automobile wheel. Timkin Roller Bearing Co., Canton Ohio—Roller bearing axles, etc. Brown-Lipe Gear Co., Syracuse, N. Y.—Equalizing gears, etc.

Space 54, International Automobile Vehicle Tire Co., Milltown, N. J.—"Fox" and other brands of automobile and vehicle tires.

Space 55—Champion Mfg Co., Brooklyn, N. Y.—Champion transmission gears.

Space 56—Weston-Mott Co., Utica, N. Y.—Wire and wood automobile wheels.

Spaces 57 and 58—The Diamond Rubber Co., Akron, Ohio—Diamond single tube and Diamond detachable tires for automobiles.

RESTAURANT.

Space A, Grout Bros., Orange, Mass.—Grout steam tonneau, described elsewhere, and one of the features of the show.

Space B, the Conrad Motor Carriage Co., Buffalo, N. Y.—Conrad gasolene touring car and runabout, with two cylinder vertical engine in front under a bonnet.

Space C, Haynes-Apperson Co., Kokomo, Ind.—Haynes-Appereson gasolene cars, with new suspension frame, newly designed body, new clutch construction, new starting device, etc. The two cylinder, horizontal balanced motor is retained.

Spaces D, E, F and I, The Electric Vehicle Co., Hartford, Conn.—Columbia electric and gasolene vehicles, thirteen in all. In the latter, which is exhibited for the first time, the noiseless hunning, speed control and accessibility features are especially dwelt upon. The car is of the four cylinder vertical type, designed on the most modern lines. The electric vehicles comprise broughams, hansome, coupes, runabouts, cabriolets, victorias, tonneaus and a special service wagon and truck, the latter being the latest type of commercial vehicles. The Electric Storage Battery Co., Philadelphia, will occupy part of this space and show Exide batteries, etc.

Space G, Moyea Automobile Co., Marion, N. J.—An entirely new Moyea gasolene car, designed along the lines of the Rochet-Schneider, with a four cylinder vertical engine, Mercedes type radiating system, etc.

Space H, Union Motor Truck Co., Philadelphia—Motor trucks.

Space J, The Cleveland Automobile Co., Cleveland, Ohio—Cleveland gasolene cars, a handsome, moderate priced car of the runabout type.

Space K, Westinghouse Electric & Mfg. Co., No. 8 Bridge street, New York City—Electric motors and charging apparatus.

Space M, Centaur Motor Vehicle Co., Buffalo, N. Y.—Centaur electric runabouts. Kirk Mfg. Co., Toledo, Ohio—Kirk gasolene cars, which will be exhibited for the first time. They are of up-to-date design, motor in front, tonneau body, etc.

Space N, Paris Automobile, Paris, France—Panhard and other French gasolene cars.

Space O, Hoffman Autmobile & Mfg. Co., Cleveland, Ohio—Hoffman single cylinder gasolene cars.

Space P, Prescott Automobile Mfg. Co., New York—Prescott steam cars, the principal model being a runabout that has made a splendid reputation during the last year.

BASEMENT.

Space 1, H. B. Brazier, Philadelphia—Brazier gasolene touring car, having a chainless drive with solid rear axle, direct drive on top speed, positive clutches, etc.

Space 2, Brennan Motor Co., Syracuse, N. Y.—Gasolene motors.

Space 2, Mechaley Bros., Stamford, Conn.—Buffalo automobiles and kerosene burners.

Space 5, Elwin L. Smith, Boston, Mass.—I. M. C. steering checks.

Space 3, Century Motor Vehicle Co., Syracuse, N. Y.—Century gasolene and steam cars. The latter is new, propelled by a single cylinder horizontal motor, placed centrally, with planetary type transmission. The steam car remains unchanged, experience having demonstrated change to be unnecessary.

Space 4, Shelby Motor Car Co., Shelby, Ohio—Shelby gasolene cars, with a double cylinder motor, having two pistons in each cylinder, the charge being exploded in the centre of cylinder. It is claimed that 40 per cent more power is gained by this method of construction.

Space 5, American Coil Co., West Somerville, Mass.—Spark coils, dynamos and ammeters. Barber Manufacturing Co., Boston, Mass.—Kerosene burners.

Spaces 6 and 7, H. H. Franklin Manufacturing Co., Syracuse, N. Y.—The Franklin four cylinder vertical engine, air coiled, gasolene car. Although in use for some time the Franklin car has not been on exhibition before.

Space 8, Cadillac Automobile Co., Detroit, Mich.—Cadillac gasolene cars, a new vehicle of the medium weight type, designed to carry two or four passengers. The engine is a single cylinder, horizontal one, and planetary transmission is used.

Space 9, the Central Automobile Co., New York.—Imported gasolene cars, Peugeot, Mors, Renault, etc.

Spaces 10 and 11, Kenneth A. Skinner, Boston.—French De Dion gasolene cars, with high speed vertical motors, De Dion shaft and gear transmission, etc.

Space 12, Conger Manufacturing Co., Groton, N. Y.—Stolz gasolene motors.

Space 13, O. H. Keep, Jr., 1147 Broadway, New York.

Space 14, Walters Car Co., New York.—Waltmobile gasolene cars.

Space 15, Whitney Automobile Co., Whitney's Point, N. Y.—Whitney gasolene cars.

Space 16, F. B. Stearns & Co., Cleveland, O.—Stearns gasolene cars, including a new and imposing looking car, closely resembling the latest foreign models, but retaining the Stearns double cylinder, horizontal engine, centrally positioned. A new valve action to insure quiet running, new small tube radiation, "Bois d'Arme" frame and controls all on steering wheel, are the special features.

Space 17, American Motor Carriage Co., Cleveland, O.—The American gasolene car, a pleasing runabout type of vehicle, driven by a single cylinder horizontal motor.

Space 18, Buckmobile Co., Utica, N. Y.—The Buckmobile gasolene car.

Spaces 19 and 20, Matheson Motor Car Co., Grand Rapids, Mich.—An entirely new and as yet unseen gasolene car, concerning which considerable curiosity is felt.

Space 21, American Georges-Richard Co. (Barry & Hayes), New York.—Georges-Richard gasolene cars.

Space 22, Warwick Cycle and Automobile Co., Springfield, Mass.—Warwick gasolene runabout.

Space 23, Motor Cycle Manufacturing Co., Brockton, Mass.—Marsh motor bicycles.

Space 24, Country Club Car Co., Boston, Mass.—Country Club cars.

Space 25, Hall Motor Vehicle Co., Dover, N. J.—Hall gasolene car, having a two cylinder, horizontal self-contained motor, with gearing necessary to make speed changes directly connected to rear axle.

Spaces 26 and 27, Lindsay-Russell Co., Indianapolis, Ind.—Parts and fittings.

Space 28, Backus Water Motor Co., Newark, N. J.—Backus water motor.

Space 29, The Meriam-Abbott Company, Cleveland, O.—Electric charging apparatus.

Space 30, Elmore Manufacturing Co., Clyde, O.—Elmore gasolene cars, with the well tested Elmore two cycle double cylinder, horizontal, opposed motor.

Space 31, A. Clement Cycle Motor and Light Carriage Co., Hartford, Conn.—Motors and attachments for bicycles.

Space 32, Standard Anti-Friction Equipment Co., New York City.—Anti-friction specialties.

Space 33, John H. Flagler, New York City.

Space 34, The Kensington Automobile Manufacturing Co., Buffalo, N. Y.—Kensington gasolene cars, with two cylinder motor on front axle, flexible shaft transmission, etc.

Space 35, Standard Automobile Co., New York.—Decauville gasolene cars.

FIRST TIER BOXES.

Space 39, the Motor & Gear Mfg. Co., New York—Gasolene motors, transmission gears and other parts.

Spaces 41 and 43, Hyatt Roller Bearing Co., Harrison, N. J.—Roller bearing axles, etc.

Space 45, Whitlock Coil Pipe Co., Hartford, Conn.—Coil pipe for radiating purposes.

Spaces 47, 49 and 51, Shelby Steel Tube Co., Pittsburg, Pa.—Shelby steel tubing for running gears, etc.

Space 40, Mfg. & Selling Co. of America., New York—Automobile supplies.

Space 42, Electric Contract Co., New York—Electrical specialties.

Spaces 44 and 46, Desberon Motor Car Co., New York—Desberon gasolene cars.

Space 48, Goodson Electrical Ignition Co., New York—Electrical specialties.

Space 50, Edison Storage Battery Co., Orange, N. J.—Edison storage battery for electric automobiles.

Space 52, Coler Woop, New York—Automobile specialties.

Hyatt will Entertain.

The Hyatt Roller Bearing Co. of Harrison, N. J., will give a box party at Weber & Fields' on Wednesday evening of Show week, same to be preceded by a dinner at Mouquin's, the latter given by a well-known manufacturing concern.

Mr. Peter S. Steenstrup, of the Hyatt Co., has the arrangements in charge.

To Protect the Tires.

One of the novelties in the tire section at the show will be the Cinch Tire Protector, which will be exhibited for the first time in the East. The device, which is made by the Cummings Tire Mfg. Co., New York, will be fitted to the Locomobile gasolene car.

Solar automobile lamps have "caught on" in splendid shape, orders for no less than 560 of the big headlights having already been booked by the Badger Brass Mfg. Co.

Commentary

I don't expect you to believe it, because really I, who tell you of it, do not believe it myself, but still the man who told me of the wonder has I am certain a credit balance on the truth side of the ledger kept by the recording angel To cease beating around the bush and come right out with it—there is a paper published within five hundred miles of New York which has not as yet announced its intention of publishing an "automobile number" neither this week nor next! My informant failed to tell me where this peculiar paper was published or what ailed its editor when he thus omitted to join the mighty throng of "automobile number"-ers, consequently I am unable to verify this, to me, highly improbable story of their being any such a man or paper. I have seen announcements that the official organs or society, horsedom, undertaking, prizefighting, plumbing and every other walk, ride and glide of life and death were to issue special "automobile numbers," and I cannot therefore believe that there can be any editor so dead to "graft" as not to have taken advantage of this opportunity for a little soft money.

* * *

Although the fates may seem unkind
And we weary of the strife,
We never kick at the "dust" we find
In the broad highway of life.

* * *

The cashier of one of the biggest banks in New York met me recently and began to question me as to practicability, safety, etc., of the automobile. I soon saw from the intelligent questions he put to me that he had given the subject considerable thought and was all ready, in theory, at least, a convert to automobiling. I asked him why he didn't go to the show, look over the vehicles there and then buy the one which suited him best. "Because I am afraid somebody on the street will hurt himself with it," was the somewhat puzzling reply he made. Asked to explain he did so in this way: "There is a presumption that any man who works for or in a bank has at his command all of the funds of that institution; there is a certainty among entirely too many people that when, in addition to being a bank employe, a man owns an automobile, he is wealthy enough to pay all sorts of damages for all sorts of things. Now, I'm no trolley company. I know people in the Long Island town where I live who would put themselves in the way of being run over by me if I had an automobile; and, what's more, every jury, petty judge and rural policeman there and elsewhere is solidly arrayed against the motor vehicle and all connected with it. When things change, as, of course, they must and will, I am going to get an automobile, sure; but as things now are I cannot afford it, thank you!" The worst part of the whole affair is that this man is only one of a great many who, like himself, would be glad to purchase automobiles had the legal status of the vehicle been more firmly established from the beginning. As it is, too many cooks, French ones at that, have only succeeded in spoiling the broth of the motor vehicle's road rights, until even the cooks themselves can't stomach it.

* * *

All free advice may seem quite nice,
But if you'll think it o'er,
You'll find it's worth about the price
You paid for it; no more.

* * *

Taking a really impartial view of my own mental equipment, I believe I am fairly entitled to classify myself as an optimist. I like to look at the right side of things and I have unbounded faith in the ability of man to accomplish almost anything. So, when, even under these conditions, I find myself unable to enthuse over a scheme or an idea I have grown used to thinking that the possibilities of their immediate accomplishment is a thing which is not quite so likely as the failure thereof. Twenty years ago no man was surer than I that I would within a few years of then be able to mount a bicycle at my door in New York and ride comfortably over a hard transcontinental highway to San Francisco. To-day, with the memory of how two decades have passed away and nothing been done to actually build a single mile of this grand highway, try as I may I find I cannot bring myself to the belief that the whole idea is any less a dream in 1903 than it was in 1883. I am aware that the American Automobile Association is fostering the scheme, but even so, I still see no chance of this thing coming to pass in your day or mine. Enthusiasm and theory, when united, will often accomplish wonders, but I believe a 5,000-mile boulevard is a bit beyond the capability of any combination, no matter what.

* * *

When she found that this adroit chauffeur
Had a good right arm to spare, for her,
This maid was very much amazed
(And possibly a trifle phased),
Protesting, timidly: "Oh, sir!"

* * *

All motors, just like all men, have their faults. No matter what make a man selects as the best for his use, there are sure to come times, plenty of them, too, when he thinks any motor of any make or any model would be preferable to the one he possesses. Too much is expected of the power supplyer of an automobile. People there are a-plenty who really believe a motor vehicle is the twentieth century edition of the wonderful one-horse shay. They think a motor should always be at its best even though its neglect should be of the worst. The best engines on a railroad are thoroughly overhauled by trained experts each day, even though they are never for a moment out of the hands of any but experts. The machinery of an automobile, a dozen times more delicate than that of a locomotive, is examined, if at all, by a man who would not be allowed to polish the brass work on a locomotive, and this "expert" turns the vehicle over as perfect to a driver who too frequently knows ten times less than he does about the whole affair. The wonder is that the vehicles run at all. Everything considered, nothing could better demonstrate than this does what a world of ignorant mistreatment and neglect the automobile can stand and does, and then despite of it all go swiftly and safely on its way in a manner little short of miraculous.

* * *

The patient sighed a trembling sigh,
And brushed away a tear,
Then cried in low and anxious tones,
"Oh! tell me, doctor dear;
When horses come to be replaced
By motor cars and such,
Do you suppose Hay-Fever'll be
Diminished very much?"

* * *

Two wealthy gentleman, horse owners and reputable citizens of Somerville, N. J., on New Year's evening, while discussing the affairs of state and more than likely the deadly automobile, got into a barroom argument as to the merits of their respective trotters. The result was a let of $1,000 a side and the teams for a race to Bernardsville. The horses were thereupon driven thirteen miles over a pitch dark road in less than fifty-eight minutes. Not considering the brutality of such a contest, and looking at it only from the standpoint of public safety, what do you think of such an affair? What do you suppose would have been the action of the rural authorities, these same gentlemen and the local metropolitan press if the racers had been automobiles in place of horses which were driven at their top speed over that unlighted road?

* * *

Of course, many people when they come to chose an automobile have many ideas as to which is the best type or make thereof; but it does really seem too bad that the other fellows should so often be so radically wrong in their selections, don't it?

* * *

Imagine a street sweeper the morning after the night before. His head is racked with pain, his throat is one long Sahara of crying thirst and his pockets are as empty as the can from which his katzenjammer came. Imagine such a man in such a profession and condition gazing at a lot of passing automobiles. Can you not hear him say, in a voice none too clear or loving:

"This automobile innovation,
This inflated, horseless creation
Is the curse of an honest nation,
Bringing a speedy termination
To my most worthy avocation."

The words he used might not be exactly these; they might be a bit fewer and much stronger. But still they would convey something of the same idea as above; don't you think they would?

THE COMMENTATOR.

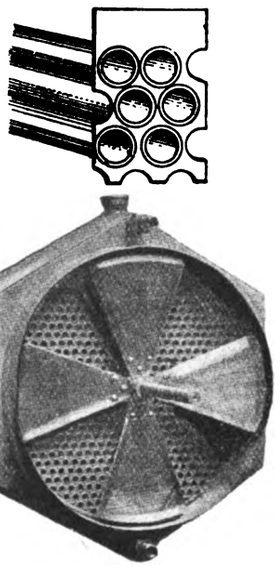
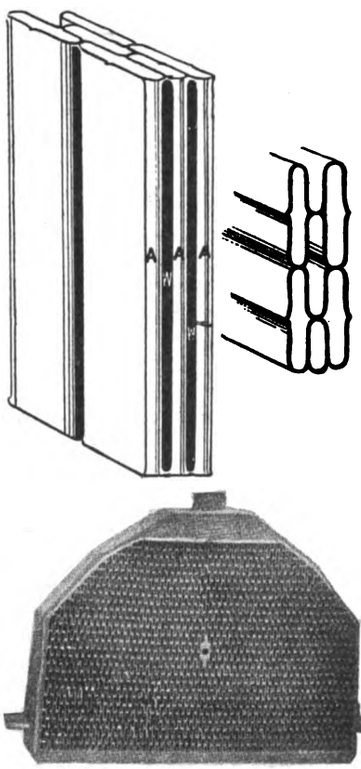
HONEYCOMB RADIATORS



Construction of the Famous Mercedes Cooler and its Many Imitations Described.

Since the Mercedes car set the fashion in bonnet shapes and radiator systems, by bringing out their "beehive" or "honeycomb" pattern, makers, and especially the French ones, have made haste to follow the lead of the clever German concern. Originally made in one set form, the copyists have varied this greatly, both as regards the shape of the bonnet and of the radiating tubes. In all of them, however, the principle is the same, that is, the tubes which pierce the tank are surrounded by the hot water as it comes from the engine, and this runs around these tubes, and is cooled by the circulation of air through them. Equally of course, the principle of all radiators, coolers, or condensers is identical. The heated steam or water which it is desired to condense or cool, as the case may be, is passed either through or around tubes exposed to the cooling influences of the atmosphere.



The two illustrations will make the construction of such coolers clear. The fan shown behind one of them is driven by the engine, and its mission is to induce a current of air through the air tubes of the radiator, so as to insure cooling. It is not always necessary at high speeds or driving against strong winds, but when the car is hill-climbing or running very slowly artificial circulation is imperative. These coolers take the form of a flat box some three or more inches thick, which is pierced by a number of tubes. The genuine Mercedes has square tubes packed very closely together, but there are numerous other sections (round, square, diamond and lozenge), and the principle in all is unchanged.

In the case of the flanged coils of radiators which have hitherto been mainly used, the water is pumped through the cooling pipes; but with the honeycomb type the air passes through the pipes, and the water surrounds them.

As the lozenge type of air tubes was one of the puzzles of the French show—people being unable to understand how the circulation was obtained, an explanation of the apparent mystery is timely. The tubes are oblong in section. Both ends are slightly expanded, and at the centre on either side a slight lip is formed. The tubes are then nested together, as shown, and are soldered together at the ends. Now the expanded lips of the tubes coming close together leave a space around each separate tube, as is depicted by the heavy shading. The air spaces —the interior of the tubes—are lettered A, while the water spaces are lettered W. The object of the central lip in the side of each tube is to form an abutment for the tube lying next to it and its opposite one; in this manner a very neat joint is secured, and the lip on each tube being very slight it is very difficult to detect any deformation. In

the illustration the water spaces are slightly exaggerated in order to show them more clearly; in reality they would be little more than half the size shown. Though this is a very small space indeed, it is claimed to be sufficient for the purpose, and it certainly

results in a very large area of thin films of water being exposed to the cooling surfaces of the tubes. The tubes are all soldered in position, and so far as appearance is concerned the lozenge form of radiator is very neat, though it is questionable whether it would prove so durable as the types with the round or square tubes, in which greater clearances are given.

Haynes-Apperson History.

The history of Haynes-Apperson cars and the improvements made in them for 1903 are set forth in a little catalogue of pocket size which has just been issued by the Kokomo firm. The fact that the manufacture of the first Haynes-Apperson was begun at Kokomo in 1893 is not generally appreciated. The trip from Kokomo to New York was made in 1899 by a Haynes-Apperson. The cuts show a runabout, a "standard model," and a surrey. The improvements enumerated make a list of just a dozen, the new starting device that renders easy for a woman of ordinary strength to start the car being one of the most interesting.

Some Ignition Statistics.

Statistics pertaining to the ignition devices used on cars at the recent Paris show reveal the fact that the tube type has passed away entirely, not one concern adhering to it.

Of some fifty-two exhibitors no less than forty have adopted accumulators—that is, batteries. Five use both accumulators and magnetos and seven magnetos alone. The latter are as follows: Georges Richard, Mors, Rochet-Schneider, Benz, Fiat, Mercedes and Dewald. The devotees of the magneto alone are Cottereau, Dietrich, Peugot, Louet and Aerocanthe.

Catalog of the Century.

To "meet the popular demand for a medium weight touring car, carrying either two or four passengers, with ample power to drive it over average American roads safely at a reasonable rate of speed," was the avowed object of the Century Motor Vehicle Co. in producing the Century Tourist gasolene car. How the object has been attained is set forth in detail in a well printed booklet just issued by the Century Co. The car itself is propelled by a 7 horse power single cylinder (horizontal) engine, and is long of wheel base, massive in construction and roomy and comfortable.

Autocar's Calendar.

One of the most effective and artistic calendare of the season is that just gotten out by the Autocar Co., Ardmore, Pa. A roadside and brookside scene, with an Autocar tonneau in the foreground, is flanked by the cups won by the Autocar in recent events, and by bunches of cattails in cream and gold, the whole set in a background of chocolate color that finishes it off most effectively.

A French firm, Sautel & Sechaud, make a cheap gasolene voiturette, the price of which begins at $400. These cars are gear driven. The gears are always in mesh, and the drive is direct for each speed. One change speed handle is fitted, and the driving is said to be simplicity itself.

BOSTON DEALERS ORGANIZE

Skinner Chosen President and Sanction for Show Will now be Sought.

Boston's talk of a combination of trade interests has crystalized, the result being a permanent organization, which was effected last week, under the name of the Boston Automobile Dealers' Association. The following officers were elected: President, Kenneth A. Skinner; vice-president, W. E. Eldridge; secretary, C. I. Campbell, and treasurer(A. P. Underhill.

The temporary committee on show, consisting of Messrs. W. E. Eldridge, F. E. Randall and G. G. Reed, was made a permanent committee, and Messrs. G. H. Lowe, Harry Fosdick and J. A. McAlman were appointed to confer with the National Automobile Manufacturers' Association, with the idea of securing a sanction for the exhibition.

Mr. Fosdick, as chairman of the temporary legislative committee, reported that he had learned through President Soutter of the Massachusetts Automobile Club that that organization would co-operate with the association in its effort to prevent the enforcement of adverse legislation. Mr. Fosdick further said that it would be necessary to carry on a campaign of education and that the members of the association must stand ready to assist the automobile club and its own committee by being prepared, at twenty-four hours' notice, to provide for a series of speed and brake tests for the purpose of demonstrating to the legislators the entire practicability of the automobile.

There is a strong probability that the association will decide to hold a local show in March next, probably during the third week.

Recent Incorporations.

Dover, Del.—The National Motor Car Co., with $256,000 capital; to manufacture motor cars and automobiles.

New York, N. Y.—Neftel Automobile Co., with $75,000 capital. Direcetors—William Hoey, Frank Sweeney and Knight Kneftel.

New York, N. Y.—The Electric Transit Co., with $5,000 capital; to operate vehicles propelled by electricity or other power. The directors are John Mills, Thomas Steeley and Franak E. Taylor.

New York, N. Y.—Motor & Gear Mfg. Co., with $25.000 capital; to manufacture automobiles and motor vehicles. Directods—John Lever, jr., Inwood; Thomas Myers and Alexander Howell, New York.

Minneapolis, Minn.—Pence Automobile Co., with $25,000 capital; to manufacture, repair and deal in automobiles. The corporators are Harry E. Pence, D. Pence and John W. See.

New York, N. Y.—Central Automobile Co., with $150,000 capital. Directors: Frank Betterton, Brooklyn; H. T. Randall, East Orange, N. J.; C. J. Gleason, New York.

Cup Course Still in Doubt.

According to the latest advices, Great Britain seems to be as far away as ever from being able to have the Bennett Cup race held on its territory. A previously selected course having been rejected on account of its being only fifty miles in circuit, the Automobile Club of Great Britain and Ireland selected another course, 131 miles long, which it hoped would comply with the rules and meet the acceptance of the Automobile Club of France. On this new course the starting point is twenty miles from Dublin, in the town of Maas. The main distance is in the counties of Kildare and Queens, there being a short stretch in County Carlow. The road surface is reported to be poor, but no worse than that section of last year's course between Bregenz and Innsbruck.

While the club was congratulating itself on having found a course, Motoring Illustrated wrote to King Edward, asking him to aid the project and, according to the Daily Mail, His Majesty has expressed disapproval of the race being contested in Great Britain, because it would necessitate a suspension of the speed law of twelve miles an hour.

The Men and Their Toasts.

The speakers and toasts at the annual banquet of the National Association of Automobile Manufacturers, which will be held at the Waldorf-Astoria on Friday, January 23, will be:

"City of New York," Jacob A. Cantor; "Horses, Carriages and Motor Cars," F. S. Fish; "National Aid to Road Improvement," George A. Pearre; "What Lawyers Hope for from Automobiles," John S. Wise; "Improvement of Our Highways and Construction of Automobiles," Albert L. Shattuck; "Electrical Matters Pertaining to Automobiles," T. C. Martin; "Various Phases of the Automobile Industry," O. C. Barber; "Automobile Literature," S. A. Miles; "How to Sell Automobiles," F. L. Smith, and "Western Highways," H. H. Gross. The toastmaster will be Winthrop E. Scarritt.

What the Moyea is Like.

Although built in a remarkably short time, the new Moyea gasolene car, which a Motor World man had a look at on Wednesday, is one that reflects much credit on its builders, the Moyea Automobile Company, newly formed. It is designed closely on the lines of the Rochet-Schneider, and has a 4-cylinder, vertical engine, mounted under a square hood, which also contains a Mercedes honeycomb radiating system. The car has already been given some lengthy test runs, and develops a speed and power that is very gratifying to its makers. The car will be exhibited at the show.

The Kaiser's Speedway.

In the plans drawn by Emperor William for transforming the Grunewald Forest into a great public park for Berlin an automobile speedway seven and a half miles long and twenty-one yards wide is said to be a feature.

EXPERIMENTS WITH GRAPHITE

Some Interesting Results Obtained in Lubricating Tests—Emulsions not Advantageous.

Pure graphite as a lubricant for steam motors has been made the subject of interesting experiments abroad. A 25 horsepower steam engine was used, and in the first tests the cylinder walls were lubricated by taking off the cover and strewing dry graphite powder on the walls; the slide valve was lubricated by blowing the powder through a screwhole in the valve box and turning the engine by hand to expose all the parts in turn. This method was not very practical, and next was tried an emulsion of graphite and water, introduced into the current of steam entering the valve box, a lubricating pump, with mechanical mixing and stirring, being employed. In spite of the energetic stirring the graphite showed a great tendency to settle and choke the passages. The experimenter concluded that in general steam engine cylinders are lubricated excessively, and that with good construction and fitting, and when the steam is saturated, lubrication is not strictly necessary at all, while for security quite a small quantity of graphite is sufficient. The use of a graphite oil emulsion offers few advantages, lubrication with pure graphite being the method to be aimed at, as, besides being cheap, it gives an oil-free condenser water and greater cleanliness. The best method of applying pure graphite to surfaces to be lubricated remains to be discovered. Experiments were made with emulsions of oil and graphite, and they were found to be expensive and liable to interrupt the working of the lubricating arrangements owing to the graphite settling in the passages.

The Life of a Dry Battery.

"The life of a dry battery?" said F. E. Moskovics, who until recently was connected with the Liberty Electric Supply Co., when the subject was under discussion. "I'd like to wage that it is possible to get 14,000 miles out of a good set. Yes, I mean 14,000 miles, but I do not mean that they will do that anywhere or with any motor. But I do believe that if a man sought to make a battery record and selected a slow speed engine and a level country like Chicago he would not have a great deal of trouble in covering the distance stated. It's the hills and the high speeds and high geared engines that eat up battery power."

"Chassis," Its Pronunciation and Origin.

Chassis—pronounced chas-sy—is the underframe of a car, and includes, in addition to the running gear, the motor, transmission gear, etc. The word was originally used in connection with ordnance, and has progressed from cannons to cars by a sort of natural transition.

About the Bakers.

Quietly as their dainty productions run, the Baker Motor Vehicle Co., of Cleveland, Ohio, has so strongly and surely intrenched itself in popular favor that to-day "Baker" comes naturally to mind whenever electric carriages are mentioned. The natty light runabouts, and the graceful, superbly designed stanhopes seem to attract equal attention, hundreds of the former being used in all parts of the country by business men to run about town, while the latter strongly appeals for physicians' and ladies' use.

As every one knows, the Baker resembles no other electric carriage, being from the ground up the creation of W. C. Baker, and built, first, to demonstrate the correctness of his theories, and, second, to refute the charge that it was impossible and impracticable to make a lightweight, electrically propelled runabout.

His theory was that great power, with the attendant great weight and bulk, was entirely unnecessary, and that moderate power applied to the driving wheels gave far better results. To attain this end the famous Baker ball bearing anti-friction devices were invented, and their success may be fairly said to have marked a new epoch in the construction of electric vehicles. In the entire carriage there is not the slightest detail of construction or design that is not worked out theoretically perfect beforehand, and afterward subjected to the severest and hardest practical tests before it is incorporated into the final construction.

The almost marvellous record of the Baker cars is due largely to these facts, their performances being at total variance with what has hitherto been considered the inherent limit of lightweight electric battery capability.

A complete exhibit of the "Baker beauties," in charge of Sales Manager M. L. Goss, will be seen at Madison Square Garden, at space No. 98.

They List Nearly Everything.

One of the most complete and judiciously arranged catalogues of automobile parts for the trade that has yet appeared is the 1903 book of the Neustadt-Perry Co., No. 826 South Eighteenth street, St. Louis, Mo. It is a well bound book of forty-eight pages and tinted cover, of a folio size that affords ample room for comprehensive illustrations of the various lines of running gears, complete machines, gears, axles, brakes, wheels, chains, radiators, dynamos, spark coils, engines, boilers, generators, pumps, valves, fittings of all sorts, lamps, bells, horns and sundries, and especially the Kokomo and Fisk tires.

To mark the completion of their handsome salesrooms at No. 141 West Thirty-eighth street, this city, the Banker Bros. Co. have sent out invitations for a formal opening to take place this afternoon at 5:30 o'clock.

The Professor on the "Problem."

Professor Frederick R. Hutton, Ph. D., dean of the faculty of applied science of Columbia University, delivered an interesting illustrated lecture on "The Automobile Problem" at the Polytechnic College, Brooklyn, last Monday night.

Professor Hutton said that if his hearers had been bitten by the bacillus of automobiling, as he had, they would agree with him that there is nothing like it. He would discuss the automobile as a motor, not as a carriage," and continued: "Here there are two classes to be considered, the storage system and the generating system. An automobilist of sporting blood has little or no use for the storage system, because it is never so powerful as when you stop. Another difficulty is that though a town may be but forty miles off, and the machine have a capacity for seventy-five miles on a level, a hill or a sandy road will use up so much power that to get to your town you frequently have to have a horse and $2. The storage machine the lecturer thought suitable for the city, on asphalt roads, for professional men and for women.

"With the generating class of motors, it is more possible to go over the parts of country where one wishes to travel, though it takes a man who is something of a mechanic to run one. It is light, safe, with an intelligent motorman, and it is much more speedy." With the aid of lantern pictures the professor discussed the technical points of motors at length.

At Every Show the ELMORE Stand Always

Looks like a Bee-Hive

With appreciative agents and buyers buzzing around it.

Small wonder, when we offer a

$1,500 AUTO FOR $800

And this year add a

Tonneau Touring Car at $1,400

A FEW FACTS ABOUT THE FAMOUS ELMORE MOTOR:

Its two cylinders have fewer parts than a single cylinder of any other type.
Either cylinder will propel car should the other be cut out.
Has Dynamo and Storage Battery. Motor will start and carriage will run on either.
The battery can be charged from dynamo while running. Tested three years.

A WINNER WHENEVER SHOWN.

Two first-class certificates New York-Boston Endurance Run.

See us at the New York Show, Space 30 "Exhibition Hall."

FAVORS FREE STORAGE

A. C. Bostwick Lets Fall the Suggestion—Some Trade Opinions of it.

"If it is done in London successfully, why cannot it be done here? I believe that if some clever, enterprising man would open a place here near the park, a big place, and store cars free, depending upon the money taken in on repairs, cleaning and oiling for a profit, he would make a go of it. He would get all the business he could handle, that is certain. And why should he not make it pay, the same as Friswell does in London? I believe he could."

The speaker giving utterance to these sentiments was Albert C. Bostwick—place, Automobile Club of America; time, Friday afternoon, January 9.

It is proper to explain that it was not Mr. Bostwick's intention to go on record publicy as a champion for such a garage system, and he probably had no desire to do so, but he was unintentionally overheard while giving emphatic utterance to the expressions quoted in the course of a chat with a couple of other members of the club, who plainly did not agree with him.

The suggestion naturally finds no supporters among those now conducting garages. The objections made to it by a few to whom it was mentioned were practical in nature and strenuous. In the first place, it was generally agreed there is very little, if any, profit in a garage business pure and simple, even at the storage rates that are now charged. The manager of one of the largest places in town said:

"Bless you, man! If any one undertook that business here he'd be swamped before he knew it. Repairs! Why he wouldn't get enough out of repairs to pay his help, let alone his rent. We have cars in here that do not have a bit of repair work on them month after month. Then we have also a lot of machines that stand for months without being used. A free storage place would be a picnic ground for the owners of such cars, and they would soon have it so well filled that there would be no room for live patrons of the sort that use their cars frequently and do have oiling, cleaning and repairing done occasionally. No, siree! None of that for me. I'll bet it is not practicable here. Some one else may try it if they want to, but I won't."

Said another man:

"Well, they do a great many things in England that cannot be done here. It does not speak well for English machines to know that a man can pay for rent and light, heat, store them free and yet come out ahead by reason of the repair work needed on them."

Still another comment made was:

"I would not want to put any car of mine into a garage run on such a basis. I would feel like a 'cheap skate' in the first place, and, second, I would be in constant fear of what might happen. It might be all right, you know, but I have heard of peculiar doings, and maybe I am cynical. I would expect to find repairs needed on my car almost all the time. I would be surprised if I went any time to take out the car and found it ready to go without any tinkering. It would be quite the regular thing, I fear, to have the car go wrong while standing idle. I have known of some queer doings, I repeat, and I should quite expect to have a yearly repair bill equal to the price of the machine if I stored it in a free garage."

Glidden Makes a Prediction.

As an authority on both automobiles and telephones Charles J. Glidden, of Lowell, Mass., ranks high. He predicts that the use of the automobile will exceed the most sanguine expectations of to-day, and that as a means of transportation of humanity and merchandise it will surpass in popularity that of the telephone as a method of communication.

Four thousand carriage manufacturing establishments in the United States are now required to supply the demand for horse drawn vehicles. More employes than are now engaged in the building of carriages and wagons will be required to keep pace with the demands for the horseless vehicle. The fact is rapidly being established that the cost of transportation through the agency of that automobile is much less than the horse drawn vehicle, and when not in use the cost of maintenance is practically nothing, therefore thousands unable to pay the cost of keeping a horse can own an automobile and take their entire family to ride.

Whipple's Big Order for Oldsmobiles.

An important deal was made last week when R. W. Whipple, Binghamton, N. Y., closed a contract to handle the Oldsmobile as a distributing agency for ten counties, including the towns of Elmira, Cortland, Norwich, Cooperstown, Oneonta, Delhi, Walton, Ithaca, Owego, etc. All agents within this territory will be supplied from Binghamton, where a stock will be kept constantly in reserve. The first carload will reach Binghamton on February 15, and thereafter a carload will reach that town every two weeks during the season.

Miller's Mammoth Horn.

What is claimed to be the largest automobile horn ever brought into this country—a very colossus of horns—is being imported by Charles E. Miller, No. 97 Reade-st., this city. It is known as No. 400, measures eight inches across the bell, and lists at $40. An oval shaped funnel, fitted with a removable strainer, is another novelty shown by the Miller establishment.

New One in Newark.

The recently incorporated Motor Car Co. of New Jersey, Newark, N. J., has secured quarters at No. 12 Belleville avenue, and will sell Northern and Autocar gasolene cars.

SUBSCRIBERS MUST PAY

New York Supreme Court Rules on a Case Involving a Motor Car Stock Company.

An important ruling has been handed down by Justice Kenefick, of the Supreme Court of this State, bearing upon the liability of signers of stock subscriptions.

It appears that James B. Brady and others in January, 1900, signed an agreement subscribing for the number of shares set opposite their names in a corporation to be organized for the purpose of dealing in automobiles. The subscribers agreed to pay for their stock whenever called upon to do so by the corporation's directors. The company was duly organized, all of the signers to the subscription agreement, with the exception of Mr. Brady, becoming corporators. He was not named in the certificate of incorporation as a subscriber, nor was he ever tendered his stock.

In an action by the company against Mr. Brady to recover on his stock subscription, after a non-compliance by him with a demand by the directors, Justice Kenefick, of the Supreme Court, has given judgment for the plaintiff. "The distinction," said the justice, "between an agreement to form a corporation and subscribe to its stock and an agreement to subscribe for shares when the corporation is organized, which excellent authority says is 'unsound in principle and disappears as mere dicta upon a thorough sifting of the cases,' has been clearly adjudicated in this State in the recent case of Yonkers Gazette Co. vs. Taylor, 30 App. Div., 334, and the agreement in the case at bar falls within the former class.

"Of such an agreement Justice Hatch says in the Taylor case: 'This is absolute and unconditional: it does not contemplate further action upon the part of those signing, and must be regarded as final, when, being unrevoked, it is acted upon by the corporation then in contemplation of formation.'"

The only essential feature which distinguished Mr. Brady's position from the Taylor case was the omission to name him as a subscriber in the certificate of incorporation. The question therefore arose whether such omission was conclusive evidence of an election by the corporation to reject Mr. Brady as a subscriber, or was simply a circumstance to be taken in connection with other evidence in determining whether his subscription was accepted. Justice Kenefick takes the latter view. He said:

"Under the very first call for the payment of subscriptions, made twelve days after the organization, the plaintiff makes a demand upon the defendant for the payment of his subscription. Any inference of rejection based on the omission of his name from the certificate is overborne by this recognition of his subscription."

FOR PHYSICIANS' USE

One who has Used both Horse and Bicycle Proves Superiority of Motor Cars.

Evidence of a cumulative character continues to be offered re the remarkable superiority of the automobile over the horse. Whether cost or convenience be set up as the standard, the decision remains unchanged. One well qualified to speak with authority on the subject is Dr. H. Cooper, of Amesbury, Mass., who in the last fifteen years has had exceptional opportunities for comparing the horse drawn buggy, the bicycle and the motor vehicle, having used them all professionally.

"This city is known the world over as a carriage town. We do enjoy an enviable reputation in that direction. We are naturally very proud of it. This was the home of the Quaker poet—Whittier—and it is here that another author of note has her home—Harriet Prescott Spofford. It is a beautiful town, and contains a class of very conservative people," he says.

"I was the first to buy a gasolene car—in fact, the first to own and use a motor car of any kind. The townspeople, and the other doctors especially, watched 'my experiment,' as they termed it, very closely. Some of the I-told-you-so's were really provoked at the end of the first month because I had not been towed home by horse power.

"I have kept a very careful account of all expenses, and give them for the benefit of your readers. It had cost me for fifteen years to keep a horse about $240—namely, $200 for board and care, and from $25 to $32 for shoeing, according to how much sharpening was necessary through the winter. To this is to be added repairs to harness, carriages and sleighs, including repainting, varnishing, etc. I had used a bicycle for seven or eight years so as not to buy another horse.

"After using a horse in my practice for fifteen years at the above cost, supplemented with 20,000 miles actually covered on a bicycle, I sold the team, gave the bicycle to a boy and bought an Oldsmobile. I began using the auto about April 1, nine months ago. During that time I have had a stable team twice and rode on the electrics some in bad weather. I rode, as a matter of choice, day or night; it mattered not, the car was always ready to go. It never failed to start or to stop. I never frightened a horse, though I did compress four dogs. I did all my work and all my pleasure, covering 3,500 miles in all. The cost was as follows: For legitimate repairs, $1.95; gasolene, $25.95 (160 gallons), batteries, $7.20; a total of $35.10.

"There were some other expenses which you could not rightly charge up to the car. I attempted one day to pass over a road when the street railway company were cutting down a grade. I got the automobile into the sand so deep that both axles rested on the sand. I tried to pull out, and as a consequence stripped three teeth off the rear sprocket. I ran into the corner of the barn one day and twisted the steering device, had some tire troubles, express charges, did some experimenting, all of which cost $25.10. Now, if any reader wishes to add these two items they can easily see what nine months' automobiling has cost me.

"There is a chapter of great pleasure and solid comfort that could be added. All this labor and pleasure was not enjoyed by the lone operator. Selfishness is not an attribute of the true automobilist. That broad, inward manliness knows no bounds of pleasure when he is cognizant that he is making others happy. The open country is ahead of you, with a knowledge that your car experiences no fatigue. A winding ascent makes the exhaust clear and resonant, but there is no hill without another side. The fragrant blossoms and bending clover of spring but ushers you into the heart and toil of midsummer. The poor beast of burden halts beneath the inviting shade of the wayside elm. You cast a pitying glance at the half dead animal while on rushes your beast of steel. The summer breezes brush the perspiration from your brow. The ten miles falls into the embrace of the twenties, and the fifties soon clasp hands of one hundred, and it has been only a pleasant seven or eight hours' trip. Home again, and would you know you had inhaled so much pure atmosphere?

"Dollars and cents is not all a man should count. How much can you obtain of this new element of life in addition to the dollars and cents saved? The automobile rightly handled on the road is an educator. The frail man and timid woman are not going to be killed outright. We can illustrate to them that we want only a little piece of the road and they can have the rest. We will be on our way, with them forgotten, while they are getting frightened. Go back to the horse? No! Not while the automobile takes me safely over thirty miles of country road by lamplight in two hours and ten minutes without a single stop. For what better service could you ask?

"The automobile is gently asking for better roads, for that is in exact accord with what it is doing itself. Every time it passes over your streets it improves the road there. It is an educator in many directions, and upon the shoulders of the operator rests the responsibility whether we take from or add to the results.

Studebaker's New Salesroom.

The handsome new Studebaker Building, at Broadway and Forty-eighth street, this city, is nearing completion. The building consists of ten stories, with lofty ceilings and spacious warerooms, and has on the eighth floor a large space which will be devoted to charging storage batteries for automobiles.

RECKONING THE COST

What it Means to Conduct a Metropolitan Garage—The Many Men Necessary.

What is the force required to "run" a modern garage and salesroom, say, in this city? How many men must be employed and how are their duties apportioned and the men kept busy and not allowed to "eat their heads off"?

The questions suggested themselves to the Motor World man last week as he was looking at the new Banker establishment in Thirty-eighth street, which was just having such finishing touches as rugs, etc., put to it.

"How many men does it take to run the place?" repeated Manager Wridgway. "Well, at the present time we have twenty, and are still adding to our force.

"They are divided into repairmen, storage department men, salesmen, demonstrators, etc., and each has certain duties assigned to him. With regard to the repairmen, their duties are explained by the name. The storage department men look after the cars left on storage, wash and clean them, lubricate, fill the supply tanks, etc.

"The salesman is almost always a demonstrator as well—that is, he can take a car out and run it as well as talk it. But we seldom send out a demonstrating car with only one man—besides the customer—in it now. It takes two men to do this right.

"Yes, it's too much to expect a man to do both," interjected George A. Banker, who had run over from Philadelphia for the day. "If he gives his attention to the running of the car he can't talk as he should, and if he works it the other way, giving his arguments the preference, he necessarily neglects the management of the car; and it is most important that it should be run just right at such a time.

"On this account we usually send out a car with two of our men. One of them runs it while the prospective purchaser sits beside him. The 'talker' takes the tonneau seat, and by leaning forward he has the buyer's ear. Thus he can talk as he pleases—about automobiling in general, descend to particulars or explain how the car is operated and controlled, the functions of the various levers, etc. We find that this way works much better than the old one."

Koehler Enlarges.

Alterations now being made will double the space which the H. J. Koehler Sporting Goods Co., Newark, N. J., will devote to the automobile branch of their business. Their building has a depth of 190 feet, and half of the two lower floors will be devoted to the sale, storage and repairs of automobiles. A complete stock of sundries, clothing, etc., is also carried. The Rambler and Waverley cars are sold, and the concern is open to take on another popular priced touring car.

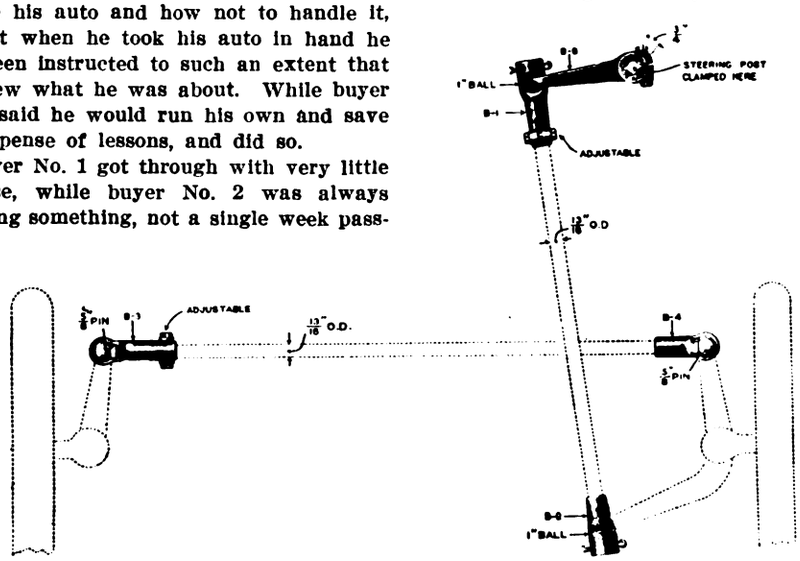
CAUSES OF TROUBLE

Many of Them Due to the Operators as was Brought Home to This One.

"It is frequently asked what part of an automobile needs the most repairs. This can only be answered by saying that it depends on who is using the motor car, for one person will wear one part, while another person will wear the machine in an entirely different part," says a well posted dealer.

"This is due to the method of handling. This may sound strange, but I have found it to be true beyond the slightest particle of a doubt. I may cite an instance wherein two of my customers placed an order for two gasolene cars at the same time. They were built at the same time, side by side, and at the same place, and finished at the same time and delivered together. Buyer No. 1 hired some one to teach him how to handle his auto and how not to handle it, so that when he took his auto in hand he had been instructed to such an extent that he knew what he was about. While buyer No. 2 said he would run his own and save the expense of lessons, and did so.



"Buyer No. 1 got through with very little expense, while buyer No. 2 was always breaking something, not a single week passing that he was not compelled to run his automobile in the repair shop and pay for what could have been saved by proper handling. No. 2's bills were always high, and he complained to buyer No. 1 about it, when No. 1 said: 'You certainly cannot be working correctly; you had better get some one to go with you to find out the faults and rectify them.' This was done, and after three months of running without instruction and falling into many errors which he should not have learned, he finally got an experienced operator to find out his faults and correct them.

"It was a great revelation to him to see his machine handled in an entirely different manner to what he was accustomed to handling it, and he was readily convinced that he was to blame for at least two-thirds of his breakages. For instance, he would rush up to his stopping place at the rate of ten or twelve miles an hour, then force both the emergency brake and band brake and stop within three or four times his vehicle's length, the jar due to the sudden stoppage of the machinery very naturally loosened the parts which were not made to stand such abuse, the emergency brake being on only to be used in case a very sudden stop were absolutely necessary. The parts which had become loosened were left to run that way, simply racking things to pieces.

"This is only one of the many things which prevent an automobile from giving satisfaction to the operator. Another very bad habit was in starting to jerk on the friction clutches of the auto in a very unpleasant manner and jarring both the person and the machinery to pieces. Imagine an engineer on a locomotive starting a train by throwing the throttle wide open and trying to run at the rate of twenty to twenty-five miles an hour in a few seconds from standing place, and you can see wherein the damage is done.

B & S's New Steering Connections.

An entirely new set of steering connections has been brought out by the Billings & Spencer Co., Hartford, Conn., and will hereafter be carried in addition to their already extensive line of automobile forgings. The new connections have been designed for cars of the so-called French type, and embody all the desirable features of the French patterns, together with several improvements in the way of adjustment. They are drop forged from the best steel for the purpose, and machined and hardened so that they reach the automobile manufacturer practically ready to apply to the vehicle. They are listed by the manufacturers in detail, so that users can get complete sets or the individual parts, as may be desired.

These connections are manufactured under Copeland's patent, and are carried in stock for immediate shipment.

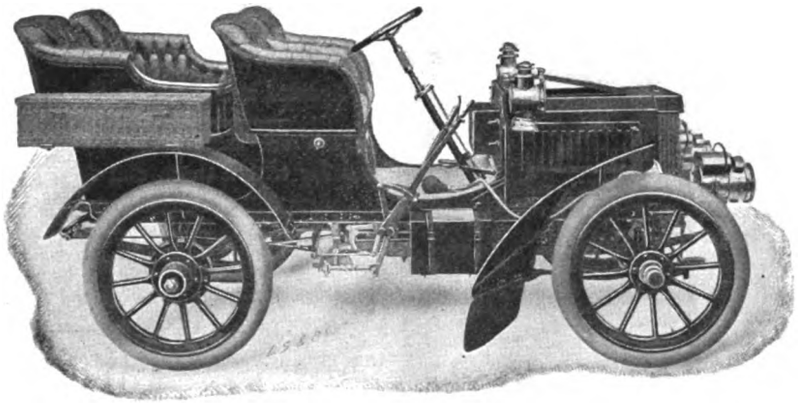
The first of the cars completed at the new works at Trainer, Pa., a model G Searchment, which had the finishing touches put on last waak, will be sent to the show in this city.

Several Haynes-Apperson cars, en route from Kokomo, Ind., to this city, were burned in a freight car last week.

ILLUSTRATED BY BULLET

Peculiar Cohesiveness of Metals and How it is Avoided in Motor Cars.

"Take clean cut bullets and press the halves together with a twist, and the result will be the parts will stick together (cohere). The principle is important and correct. The machine designer has to see that in no case will any two pieces of metal in his machine be allowed to approach the condition of the bullet—that is, to come together forcibly and with a twisting motion, for what is true of lead is presumably true of other metals. Obviously the particles of a piece of metal stick together by virtue of some force exerted between them," says a well posted man.



"Assuming, then, the predisposition of two similar metals to cohere or unite under favorable circumstances—namely, the coming into actual contact; that is, with nothing between them—we see why provision has to be made to keep them apart all the time. We do this by interposing a continuous film or layer of some substance that has the property of maintaining a very thin film under considerable pressure, and at the same time feed with facility through wicks, fine tubes, etc., such substances being called lubricants.

"It seems quite rational to infer that dissimilar metals are less likely to cohere than similar ones; water and oil, or mercury and oil, will not mix as readily as parts of the same liquid, and probably the same is true of solids. Whatever the attraction between the molecules, it seems plausible to believe the attraction to be stronger between those of a like nature.

"It is a fact well known that metals of the same kind will not work well together; they are more likely to seize and cut than dissimilar metals. A journal and its bearings are never of the same metal; it may be said that other reasons obtain—that the bearing must be softer, to take the wear, as being the easily replaced part, and also that the bearing metal has to be chosen for its heat conducting and anti-friction properties. All this is true, but the fact remains that where two are both made of hard metal they are made unlike. Hub liners are made of cast iron, bronze, etc., so that the steel hub shall not have to work against the steel box; also cast iron eccentric straps do better on a wrought iron sheave than do wrought iron straps; similarly cast iron crosshead shoes work better on steel guides than would steel shoes."

Following the example of the Automobile Club of America, the Rhode Island Automobile Club has completed arrangements with the storage station, corner of Pine and Garnet streets, adjoining the club quarters, whereby guests of the club may leave their carriages without charge for a stated period, and club members will be able to secure many other conveniences.

WHY THE SUDDEN FLOP?

After Flaying Automobiles, Hearst's Paper now Essays to Act as Their Champion.

"Certain citizens feel very proud when they can interfere with the use of automobiles. Not only hoodlums and roughs entertain this peculiar pride. The pride afflicts men who should know better—drivers of trucks, motormen of streetcars and others, usually intelligent working men," says that erstwhile autophobe, the Journal, which has repented of its evil ways—in this particular—and is now cultivating the mechanically propelled vehicle.

"If you throw a stone at an automobile you prove, almost invariably, two things: First, that you are jealous of another man's pleasure or prosperity; and, second, that you are ignorant and do not look ahead.

"As to the jealousy—there is nothing to be gained by preaching about that. Some men make a plucky effort to achieve success, and others, especially the most ignorant, try to excuse their own failure by decrying the more fortunate or able. It is to the ignorance involved in attacks on automobiles that we wish to call attention.

"The man who to-day buys and experiments with the high power automobiles is a great public benefactor. He may not know it, and he may have no desire whatever to be of use to others. Nevertheless, he is one of the most useful of citizens.

"You must see clearly that in the future the automobiles will be of greatest value to the poorer classes of people. They will be made cheaply and kept cheaply. They will enable the small capitalist to compete with the railroad and streetcar monopolies. Already the automobile can carry passengers on good roads more cheaply than they can travel in the railroad cars.

"This cheapening of travel is important to the poor man. The rich man does not care what he pays for his railroad ticket, and he can keep horses, no matter what the cost. In a few years poor people will go on beautiful long trips through the country in cheap automobiles. In a very few years millions of men and women and children will reap the benefit of the present automobile experiments.

"Millions upon millions of dollars have been spent in devising and trying new automobiles. Many millions more must be spent. Who is going to spend that money if you treat as a criminal the man of wealth who buys and tries the immensely costly machines that are now the forerunners of the future automobile? True, the rich man buys the ten thousand dollar automobile for his own pleasure. But he need not be treated as a criminal on that account. And since his amusement means future welfare for all, why not encourage him instead of discouraging him.

"If you should succeed to-day in stopping the use of automobiles for pleasure, the automobile industry would die out, thousands of men would lose their work, and, what is infinitely more important, the entire people would be deprived in the future of a great blessing.

"In less than fifty years from now the working man, the mechanic and the laborer will go to their work from their cottages in the country in automobiles. You smile at this? Don't smile too confidently.

FUN IN AN OLDSMOILE.

"Do you remember when the present model of bicycles first came into fashion? Who used and paid for the first bicycles at $100 or more each? The rich men and women. Who made fun of the first bicycle riders, laughing at their sensible costumes, throwing tacks on bicycle paths, doing everything to delay the manufacture of the cheap bicycle by discouraging those who paid for the first experiments? You did, you who now laugh, or throw tin cans at the fast automobile did the same for the bicycle not so many years ago.

"If the owner of an automobile is reckless he should be punished. But he should be considered and treated as we treat the reckless driver or the reckless drunkard. There should be no foolish ignorance or jealousy to discourage his attempts to improve the horseless machines. As a matter of fact, the reckless automobilist will never be very numerous. For his recklessness threatens you only occasionally, whereas it threatens him all the time.

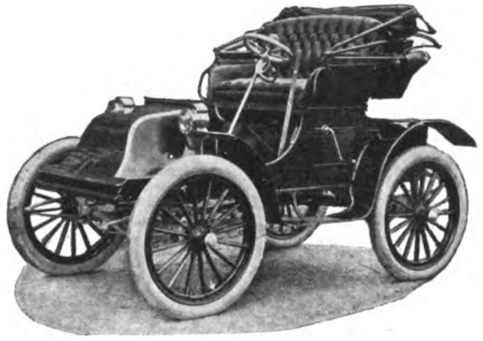
"One of these days the automobile will be the great blessing of the poorer classes. One of these days there will be a great union of highly paid, highly skilled mechanics making their living by the management of horseless vehicles. In a few years the millions of our citizens wil bless the makers and the buyers whose energy, or skill, or love of pleasure, or innate extravagance, made the cheap, safe, effective automobile possible.

"Therefore, when you see a man dressed in his goggles and furs ploughing along in his red or pink or purple or green machine, do not be foolishly jealous or irritable. Say to yourself: 'That man is doing good work, perhaps without knowing it. He is paying for the future comfort of the people.' If he goes too fast or recklessly, complain of him.

"But do not prove your own foolishness or jealousy by forcible interference, by vulgar abuse or by trying in any other way to check the growth of a great public necessity."

Spencer's Gasolene-Type Steamer.

Work on a steam car of thoroughly modern design, intended for Raymond Goodrich, of Hartford, Conn., and Captain C. M. Spencer, of Windsor, Conn., has progressed sufficiently to afford a good idea of its appearance when completed. It is being constructed at the Mansuy & Smith shops, in Hartford, and closely resembles the gasolene type of car.



The new vehicle is one of particularly long wheel base, ten feet separating the forward and rear wheel centres. The tonneau will carry four persons and two may ride in the front seat. The capacity for oil and water is large, and the vehicle will have more power than most steam carriages, and the engine and boiler will be located forward under a bonnet.

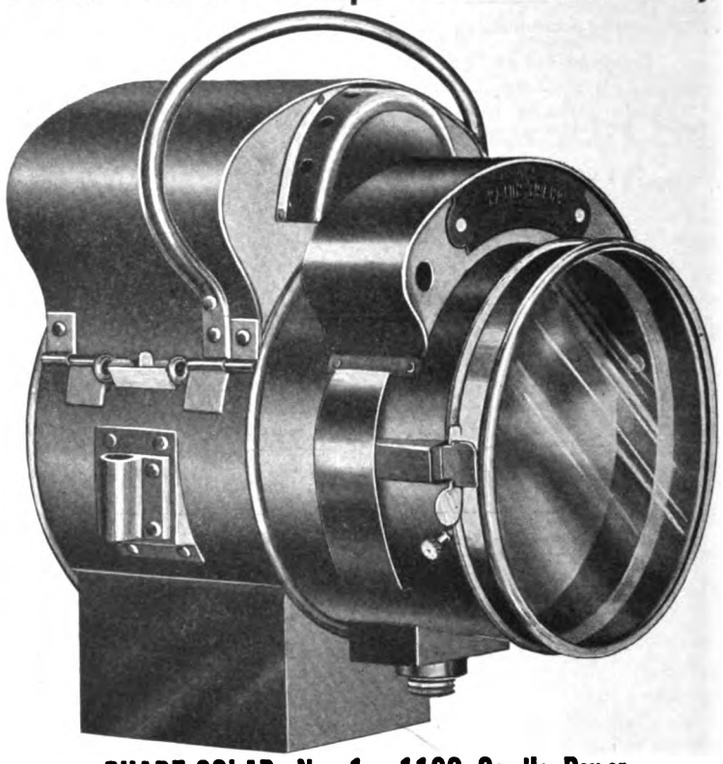
Captain Spencer's engine arrangement and driving device will be employed, and a boiler of large capacity will furnish steam to the engine.

Digitized by Google

THE HAYNES-APPERSON

is unique. It is its own type. It has proved the best for American roads, better than foreign types—better than the so-called "American type" of motor car. It is the oldest make in America—one of the oldest in the world—the most thoroughly developed.

It is interesting to note that the 1903 "Improvements" of the Paris Show have all been features of the Haynes-Apperson Car for years. Our throttle control and sparker with magneto is superior today to the best foreign practice; also our band clutch, free from end-thrust.



We have issued (in addition to our regular catalogue) an interesting booklet that tells why it is the best. Shall we put you down for one? You will greatly oblige us by naming THE MOTOR WORLD when you write. Catalogue free, too.

CARE AND REPAIR OF TIRES

Little Things That may be Done to Lengthen Their Life and Service.

Tire care and repair is a matter that merits much more attention than it usually receives.

After a car has been run for a hundred miles or so, there will be some cuts, some large and deep, some small, in the tires. An hour or so should be spent in cleaning them out and plugging them with cotton wool and solution, or, better still, with a special rubber that can be obtained for the purpose. If these cuts are neglected they take in the wet, with the result that the tread becomes loose about the spot and peels off, and the only remedy is to send the cover away and have a new piece vulcanized in, or, if the damage is very bad and in several places, to have a new tread fitted. All this costs money, and when one recollects that the value of a set of average tires is about upwards of $100, it is hardly worth while to spend more money when a little care would have saved it.

If a bad cut occurs leaving a fair size hole in the outer cover, it is perfectly useless to put on a piece of canvas only a little larger than the hole. The repair must be thoroughly effected in the following way: Supposing there is an inch gash in the cover, the space round the cut should be cleaned for about six inches each way. Solution it and leave to dry. Three pieces of canvas will be required, and the first should measure about 8 in. This should be affixed, bringing the canvas down to the beaded edges. The next piece should project an inch or so over the first, lengthwise, but need not go right down to the edges of the cover—say about half an inch off. The last piece should project an inch or so over the second and should also fall a little bit short of the edges. Three thicknesses of canvas are now fixed, and, so far as the inside is concerned, there is no more to be done. The gash should be cleaned out and plugged with special rubber. This kind of repair is the only one that will effectually hold a nasty cut (short of sending the cover away to have it repaired), and it should be borne in mind by those who put fancy little pieces of canvas over big gashes.

Tube repairs require time to make them a really satisfactory job, especially large ones, so it is best to do these at home, carrying spare tubes. It will be found a very good plan, after cleaning the tube for a patch, to rough it well; a very fine wire brush is the very thing for the purpose. This roughing will cause the solution to sink slightly into the rubber, and consequently the repair is far stronger. Patches supplied in repair outfits are always roughed on the side intended for solutioning.

The security bolts, which help to retain the cover in position, are very often neglected. They should be kept screwed up tight at all times.

Dust caps should always be kept on valves, as most valves leak slightly, and as the dust cap has a washer inside, this leakage is prevented. Automobilists who are fond of applying the brakes suddenly should recollect that they have tires. Skidding a tire along a rough road is one of the worst things possible for a cover. Oil splashing from the engine often reaches the front tires, and as oil is one of the worst enemies of rubber, this evil should be remedied by fitting up light guards. If these facts are borne in mind and acted upon, it will be found that pneumatic tires are not so black as painted.

Looking Under the Paint.

That it is always a good idea to look under the paint, i. e., to make more than a superficial examination of a car bought at second-hand, is shown by the following incident:

"We had a car brought into our garage a few days ago to have some slight repairs done to it," said a tradesman. "The owner instructed us to send the car up to his house, as he had only just purchased it and could not drive it. The car was taken out of the garage and the engine started, and just as the man was setting off, the main arm of the steering gear broke clean away. An examination of this part showed that the three-quarter-shaft, which controlled the steering, had been recently broken off, and it had been repaired by simply putting the two surfaces together and soldering it round the edges. Of course, a repair effected in this manner is nothing short of criminal, and the owner of the car may consider himself very lucky indeed that it did not come off when he was going at twenty miles an hour."

The Motor Language.

"In motor language there has sprung up some curious misuses of terms and forgetfulness of their meaning," says a transatlantic contemporary. "For instance, one constantly hears the expression—'chauffeur,' and we frankly admit it has appeared in our columns on several occasions. But the word 'chauffeur" is really the French term for the fireman on the footplate of a locomotive, and designates what in English we call the 'stoker,' or 'fireman.' So when we call the lady motorist the 'chauffeuse' we might in English call her 'stokeress,' which does not sound in the least pretty. We talk about a sportswoman, or a fisherwoman; why not talk, then, about a motorwoman? Or, if we want to adopt a combination of French and English, might we suggest a word with a prettier sound—'motoriste'? The only case in which the term 'chauffeur' might be correct is in the case of a Thornycroft lorry, or any other motor car in which live coal or coke is used.

LEGAL TEST OF GASOLENE

Demonstration Made for Court's Benefit Proving Safety of the Fluid.

Evidence offered and accepted in court is now on record to show that gasolene is not the dangerous stuff which so many commonly consider it to be. The evidence was submitted in a case of lawsuit in England in which the plaintiff testified that a lighted cigarette had caused the ignition of some gasolene that was being poured into a tank. The defendant, a motor maker, offered in rebuttal a sworn statement of a list of experiments, and these were substantiated as having been witnessed by an official from the Royal School of Mines. The tests made were as follows:

1. A lighted match placed at the opening of a new two gallon can of gasolene merely caused a small flame an inch long, which could be extinguished with the point of a finger.

2. Gasolene was then poured into an open vessel and a lighted cigarette dropped into it. Result: It was at once extinguished.

3. A lighted cigarette was then smoked vigorously from within two feet above to a quarter of an inch of the gasolene; also all around and underneath the vessel, but no ignition occurred.

4. A small quantity of gasolene was then poured on the cigarette while still smokinfg; still no ignition occurred.

5. A case was then made hot and the gasolene poured into it, so that it would vaporize more quickly; a lighted cigarette was then smoked into it, as in case No. 3, but failed to cause ignition.

6. Two vessels were placed eighteen inches apart, with gasolene in each, so that the affinity of the vapor of the gasolene from one vessel to the other would meet; a lighted cigarette was then smoked between the two and at the likeliest part where the gasolene vapors would meet, but still no ignition occurred.

7. Gasolene was forced under pressure through a fine hole, so as to spray the gasolene, and a cigarette smoked in the spray, but still no ignition followed.

8. An explosive mixture was then made up in a vessel, and a cigarette smoked around and inside. No result; but a light dropped in caused an explosion.

Each of the above experiments was tried a great number of times, and it was impossible to light the gasolene by the fire or sparks from a cigarette.

The vapors of gasolene, being heavier than the atmosphere, never rise, but fall and run along the ground or surface on which it has been spilled.

For German Army Use.

In the new Germany army estimates is an item of $25,000 for experimentation with field automobiles, which are stated to have shown themselves of permanent value.

Digitized by Google

ABOUT ELECTRICITY

Some of the Rudimentary Whys and Wherefors Making Plain the Process of Generation.

Electricity is a subtle form of energy which may be called into existence in many ways, but always at the expense of some other form of expended energy or the destruction or transformation of some other substance.

Once generated the current tends to dissipate itself, and will take the first available path to "earth," so that to get useful work from the current it is necessary to lay conductors to the place where the work is required to be done, and to prevent the current from leaking away from its proper path the conductor is incased or otherwise protected by insulation. All substances in nature are conductors or insulators in a degree, but some are much more effective than others; thus all the metals are conductors, and, although copper does not rank highest in the list, it is usually employed on account of cost, i. e., higher efficiency conductors are only found among the precious metals, though for some purposes, such as land telegraphs, iron wire is used on account of its still lower cost. Insulating substances in principal use are india rubber, gutta percha, porcelain, glass, vulcanite, ebonite, silk, etc.

Thus the conductor which may be of copper is wrapped with cotton or silk, and then incased in one or more layers of rubber or gutta percha and further wrappings of cotton, according to the degree of insulation required, or the wire may be carried through midair on porcelain insulators as in the telephone. But whatever the method of insulation, the object is the same, to convey the current from the generating point to the point where it has work to do with as little loss as possible from leakage.

The next consideration is resistance, for if the conductor is of insufficient area, and of great length, the quantity of current cannot be passed, so that a thicker wire must be substituted, and on short distances it is policy to use wire of ample area, but where the distance is great the cost of the copper becomes prohibitive, and so the quantity of current is decreased and the intensity increased, the same result being arrived at.

This decrease of current and increase of intensity may be likened to water flowing through a pipe; a pipe of certain size can deliver only so much water an hour at a certain pressure, but by increasing the pressure and causing the water to flow faster the quantity discharged may be increased according to the increase in pressure. The electrical term signifying pressure or intensity is the volts, and the term ampere denotes quantity, and the product of the two is the watt, thus with a given conductor it may be necessary to use a pressure of ten volts to transmit five amperes of current, equalling fifty watts, or the dynamo or battery may give a current of ten amperes, at a pressure of five volts only, the electrical energy expended being the same in either case. Certain electrical phenomena demand the employment of very high voltages, but small amount of current, the spark which fires the charge in a motor being a case in point.

The lighting of an arc lamp, on the other hand, demands a considerable quantity of current compared with the pressure employed, these variations in quantity and pressure being accomplished by the manner in which the battery is coupled up or the dynamo wound. The most simple form of electrical generator is a single cell in which a metal (usually zinc) is consumed by an acid, for if a zinc rod be immersed in dilute sulphuric acid it will be rapidly consumed with violent ebullition, and hydrogen gas given off, and if a carbon rod be immersed in the same jar, but separated from the zinc, and copper wires attached to each, an electric current will flow from the zinc rod through the liquid, which is a conductor, to the carbon rod, and so through the wire conductor to the zinc rod when the ends of the two wires are in contact.

If now some instrument be connected to the two wires the passage of the current may be detected, but one cell will not give any great amount of power for doing actual work, though it may be made to ring a bell, consequently the cells are multiplied until the requisite amount of current is obtained, and the manner in which the cells are connected will determine the ratio between quantity and pressure.

Of course, the simple form of cell described is not what would be actually used, but merely serves to explain the action. Where large quantities of current are required, or very high intensity, the battery method is not suitable, as an enormous number of cells would be required, and both expense and trouble would be prohibitive, so in this case a dynamo is used, and according to its size, speed and the manner in which it is wound, any desired quantity or intensity of current may be procured to suit the particular work in hand, whether it be ringing a bell, lighting a glow lamp or transmitting a thousand horsepower.

What Causes the Outcry.

"Sometimes I almost think that the outcry against automobilists is excusable, if not justified," exclaimed a man who is addicted to the pastime to the Motor World man the other day.

"One reckless or inconsiderate chauffeur can do more to create an unfavorable impression than ninety-nine of us can to remove it, try as we will. In fact, it is the one offender and not the ninety-nine innocent users that occupies the centre of the stage and excites animosity. He does the harm and usually goes scot free, while we suffer for his misdeeds.

"There was an instance of the kind that came under my notice a day or two ago. I was walking down Broadway, and when near the crossing of Sixth avenue and Thirty-third street an automobile shot down the street at a speed that must have been very close to twenty miles an hour—not a policeman's twenty miles, nor yet a chauffeur's when he wanted to show how fast his car was, but a real mile in three minutes clip as would have been shown by a Jurgensen watch.

"Now, you know what that crossing is like. There are three streams of traffic—street-cars, carriages, trucks and automobiles, and pedestrians from the Macy, Saks and other nearby stores, promenaders, etc., enough to keep the policeman on guard at the corners busy.

"All other wheeled traffic was proceeding at a slow pace, but this automobile—which, as I afterward learned, came from one of the group of garages in Thirty-eighth street and was in charge of a rather greasy looking, leather coated chauffeur—whizzed by as if it had been an ambulance or a fire patrol wagon. In and out it weaved, cutting close to trolley cars, frightened women and angry men, while people on the sidewalk, myself among the number, stopped to look after it.

"The comments were quite audible, and I almost felt like adding some of my own. If the car, which was a big tonneau, with only one man in it, had struck any one I would cheerfully have borne testimony against it."

The Week's Patents.

717,607. Electrode for Storage Batteries. Leonard Paget, New York, N. Y., assignor to Charles Coster, New York, N. Y. Filed September 8, 1899. Serial No. 729,837. (No model.)

Claim—1. A plate adapted to form a storage battery electrode and consisting of a thin corrugated plate of compressel aborescent crystals of lead, substantially as described.

717,608. Method of Preparing Storage Battery Electrodes. Leonard Paget, New York, N. Y., assignor to Charles Coster, New York, N. Y. Filed October 19, 1899. Serial No. 734,049. (No model.)

Claim—1. The process of making a plate adapted to form a storage battery electrode, which consists in pressing finely divided lead into a thin corrugated plate, substantially as described.

717,609. Storage Battery Elecrrode. Leonard Paget, New York, N. Y., assignor to Charles Coster, New York, N. Y. Filed January 10, 1900. Serial No. 911. (No model.)

Claim—1. A storage battery element consisting of a conducting support and finely divided lead on said support compressed to a density approximately that of sheet lead, substantially as and for the purpose set forth.

717,610. Storage Battery and Method of Preparing Electrodes Therefor. Leonard Paget, New York, N. Y., assignor, by mense assignments, to Charles Coster, New York, N. Y. Filed January 10, 1900. Serial No. 912. (No model.)

Claim—1. A storage battery element in which the active material consisting of a thin corrugated plate of compressed arborescent crystals of lead and a frame of elastic non-conducting material about the edges of the small plate, substantially as described.

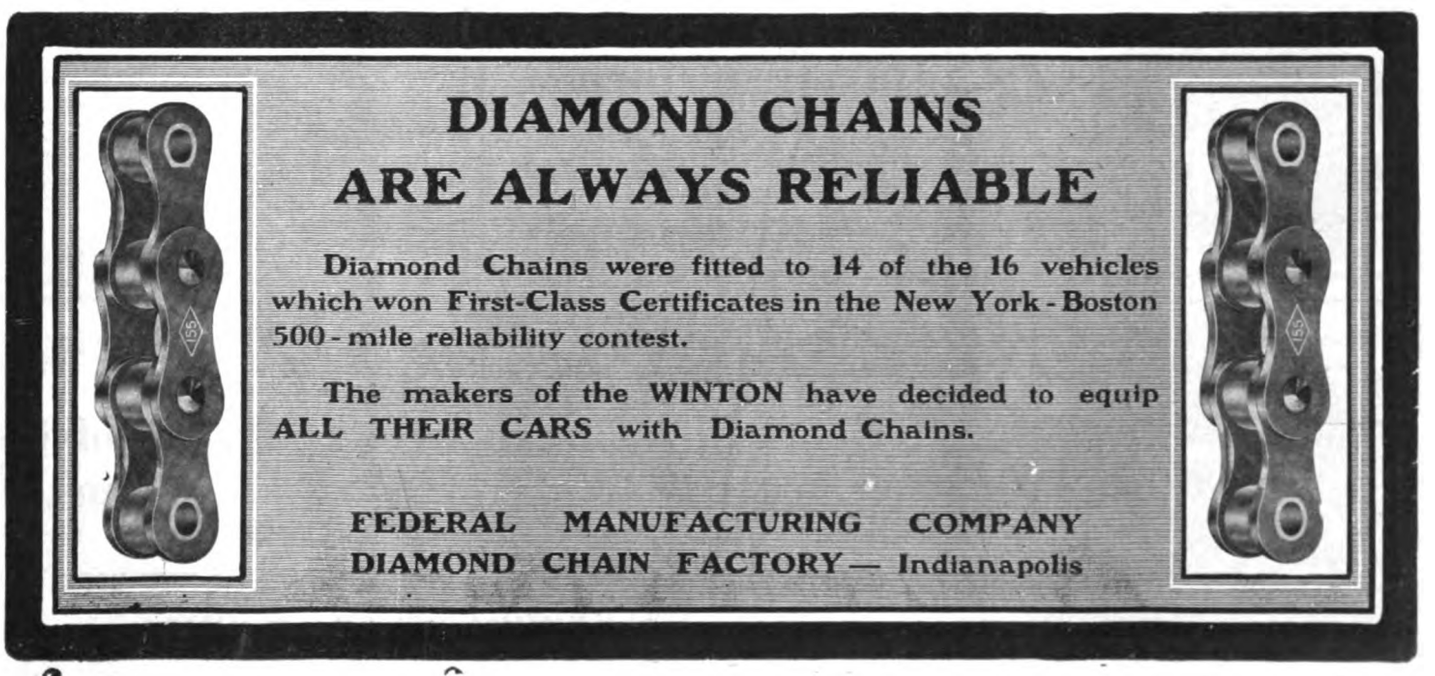
717,688. Gas and Air Regulating Valve. Elmer E. Kerns, Bradford, Pa. Filed May 19, 1902. Serial No. 107,992. (No model.)

Claim—1. The combination with a valve casing provided with an inlet and an outlet opening and a valve plug rotatably mounted within said casing and provided with graduated openings adapted to be brought into register with the outlet opening of the valve casing; of a mixing chamber communicating with the outlet opening of the valve casing and provided with an air inlet opening, an air regulating valve for said mixing chamber, and a connection between the air regulating valve and the valve plug, whereby when the latter is operated to regulate the flow of gas through the outlet opening, the air regulating valve will also be operated to control the admission of air to the mixing chamber, substantially as set forth.

717,753. Hydrocarbon Burner. William J. Lane and George Lane, Poughkeepsie, N. Y. Filed May 8, 1901. Serial No. 59,328. (No model.)

Claim—1. A hydrocarbon burner comprising a centrally disposed tube, having one portion of its length located outside of the combustion chamber in which the burner is situated, a series of spaced lateral tubes so arranged as regards each other as to permit but thin currents of heated air to pass upward on each side of said tubes, and a tube located out of the combustion chamber within which the burner is situated, but in such position as regards said burner as to be heated thereby, said tube open at one end to the atmosphere and communicating at its opposite end with the portion of the centrally disposed tube which is exterior to the combustion chamber.

717,823. Steam generator. Jackson Deneal, Toledo, Ohio, assignor of two-fifths to Stephen Brophy, Toledo, Ohio. Filed December 23, 1901. Serial No. 86,914. (No model.)



Claim—1. In a steam generator, the combination of an outer and an inner plate having equal centre portions parallel and horizontal, and end portions of equal width, the end portions of the inner plate being bent at right angles to the central portion and of the outer plate curved outward and downward parallel with the end portions of the inner plate; end plates closing the top, side, and bottom openings between the outer and inner plates and riveted thereto around their edges, and forming with the outer and inner plates a boiler shell having vertical rectangular water legs opening into the water and steam space between the horizontal central portions of the outer and inner plates; plates secured to end plates of the legs and forming with the inner plate a combustion chamber for the shell; a flue for the combustion chamber extending centrally through the top of the shell; parallel rows of inclined water tubes connecting opposite legs; plugs in the outer plate opposite the end of the tubes; staybolts at intervals through the outer and inner plates of the shell and secured thereto; a water feed pipe connected to one or more legs of the shell and a steam pipe or pipes tapping the steam space.

717,902. Electric Igniting Device for Internal Combustion Engines. Frank R. McMullin, Highland Park, Ill., assignor to McMullin Motive Power and Construction Co., a corporation of Illinois. Filed February 7, 1902. Serial No. 93,104. (No model.)

Claim—1. In an igniter for gas engines, the combination with a stationary contact of a movable contact, and means for moving said movable contact, comprising a lever in operative association therewith, a ratchet arranged adjacent to the lever, a moving member actuated by the engine, an adjustable pawl carried by the moving member engaging the ratchet, and an adjustable pawl carried by the lever, likewise engaging the ratchet.

717,913. Water Tube Boiler. Herbert E. Penny, Minneapolis, Minn., assignor to W. S. Nott Co., Minneapolis, Minn., a corporation. Filed March 7, 1902. Serial No. 97,037. (No model.)

Claim—1. In a steam boiler, the combination with outer and inner vertical shells providing an annular water leg intermediate, their lower portions and an annular steam space intermediate their upper portions, the outer shell being of uniform diameter throughout its height and the inner shell tapering gradually from its base to its top; of a series of separately removable tube sections arranged in parallel vertical planes, each tube section comprising vertical headers and connecting tubes; and means for detachably connecting such tube sections with the lower portion of the water leg and

Digitized by Google

the upper portion of said steam space, substantially as set forth.

717,827. Spring Tire for Vehicle Wheels. William T. G. Ellis, Glasgow, Scotland, assignor to Thomas Alexander Jebb, Glasgow, Scotland. Filed December 5, 1901. Serial No. 84,800. (No model.)

Claim—1. The zigzag wire springs formed with deep lateral indentations and projecting edges for attachment to the rim of the wheel; in combination with a suitable cover in which said springs are inclosed and a wheel rim formed with peripheral flanges and channels into which the projecting edges of the springs are sprung, substantially as described.

717,914. Steam Generator. Herbert E. Penney, Minneapolis, Minn., assignor to W. S. Nott Co., Minneapolis Minn., a corporation. Filed April 26, 1902. Serial No. 104,754. (No model.)

Claim—1. In a steam generator, in combination; outer and inner concentric shells providing a water jacketed firebox, the inner shell being the shorter and provided with a crown sheet; a head and a depending funnel shaped smoke flue with a closed base covering the outer shell and providing an intermediate steam space; a series of removable tube sections arranged in parallel vertical planes, each tube section comprising a pair of opposite vertical headers and inclined tubes connecting them, the inclinations of the tubes being opposite in adjoining sections; detachable pipe couplings connecting the lower ends of the headers with the water leg and detachable plugs connecting their upper ends with the crown sheet; and a series of vertical flues connecting the crown sheet and smoke flue base for the passage of the products of combustion from the firebox to the smoke flue, substantially as set forth.

717,990, Valve Seat for Explosive Engines. Winfred M. Harvey Denver, Col. Filed August 18, 1902. Serial No. 120,005 (No model.)

Claim—1. The combination with a valve, of a valve seat comprising a projection surrounding the passage to be controlled, two rings applied to the opposite surfaces of the projection and normally projecting beyond the same, to form a groove or channel, and a suitable packing located in said groove, the rings being automatically adjustable by the action of the valve, to compensate for the wear of the packing, substantially as described.

718,045. Electrical Storage Battery. Henry K. P. Barham, Portsmouth, England. Filed December 2, 1901. Serial No. 84,489. (No model.)

Claim—1. In a device of the character described, a series of strips of metal each folded upon itself with saturated absorbent material between the folds thereof, and forming a tray intermediate the ends thereof.

718,064. Valve Gear for Gas Engines. John C. White, Decatur, Ill., assignor to William L. Oakes, Decatur, Ill. Filed March 26, 1902. Serial No. 100,133. (No model.)

Claim—1. In a valve gearing for engines, the combustion of an inlet valve, an exhaust valve, a lever pivoted only to said valves, to one valve at a point between its ends and to the other valve at one end, and actuating means applied to the other end of the lever.

717,754. Hydrocarbon Burner and Attachment. William J. Lane and George Lane, Poughkeepsie, N. Y. Filed May 12, 1902. Serial No. 106,972. (No model.)

Claim—1. A hydrocarbon burner comprising a casing, a mixing chamber, a portion of which is within the casing and a portion of which is external to the casing, a supply tube for the mixed gas and air extending through the portion within the casing and into the portion external to the casing, and a series of transverse burner tubes communicating with that portion of the mixing chamber within the casing.

When you come to reflect that in efficiency almost half of all the motors are below the average, you are inclined to distrust them, until you recollect that this is equally true of everything else in the world, and then you are angry because you never thought of that.

THE BERG CHASSIS

8 And 15 H. P.

Under reigning conditions in this country, no matter how much money may be spent for a vehicle, it is invariably known as the product of the factory rather than the property of the owner.

As a remedy we propose that customers confine their dealings with us to the purchase of the chassis, and consult with expert carriage makers concerning body design, upholstery, furnishings, etc.

Our pattern book enables customers to choose from hundreds of original body designs, amazing to those who fancy that in the vehicles seen to-day the possibilities of design are exhausted.

Our Limit.

ONE thousand WINTON TOURING CARS will be manufactured during the current year. Even with greatly increased facilities and a system for production not excelled by another automobile manufactory in the world, we cannot go beyond the one-thousand mark and incorporate in every car the standard of Winton excellence. With this necessarily limited production we cannot expect to meet demand, hence this early opportunity to caution prospective buyers upon the wisdom of getting "under cover" early with their orders.

WINTON SALES BRANCHES AND AGENCIES ARE IN NEARLY EVERY IMPORTANT CITY IN THE COUNTRY. OUR NEW CATALOG IS SO FRESH FROM THE PRESS THAT THE INK IS SCARCELY DRY. DO YOU WANT A COPY?

BEFORE BUYING EXAMINE THE

WHITE STEAM TOURING CAR

FOR 1903

THE WHITE IS A STEAM CAR WITH THE DISTANCE OF A GASOLENE AND THE EASE OF OPERATION OF AN ELECTRIC.

In the 500 mile Reliability Contest from New York to Boston and return, arranged by the Automobile Club of America, three WHITE STEAM STANHOPES covered the distance without stop or trouble of any kind—a perfect performance.

THE WHITE STEAM GENERATOR

is absolutely non-explosive, gives pressure in five minutes from cold water, and once in motion is self-regulating.

The same motive power which has been so successfully used in former White models will be used in the new touring car.

Write for full particulars, including Professor Thurston's report on our steam generator, and the official reports of important endurance contests.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, January 22, 1903. No. 17

SMITH & MABLEY SUED

Electric Vehicle Co. Institutes Proceedings Alleging Infringement of the Famous Selden and Two Other Patents.

On the eve of show week what is virtually the first gun in gasolene car patent litigation was fired. The concern behind the gun was the Electric Vehicle Co., of Hartford, Conn., and Smith & Mabley, of this city, the well known importers of French and German cars, were selected to receive the charge.

Suit has been brought on two counts. The first suit is that of the Electric Vehicle Co., owners of the well known patents of G. B. Selden on gasolene vehicles, No. 549,160, versus Albert D. P. Smith, et al. The second is brought by the Electric Vehicle Co. and the Morton Trust Co., the latter being assignees of the Maxim patent, No. 699,543, and the Maxim and Pope patent, No. 702,448, versus Albert D. P. Smith and Carlton R. Mabley, trading as Smith & Mabley. The last patents are those covering the steering gear generally known as the "backlock steering mechanism."

The suits acquire their importance from being the first serious attempt outside of the pending suit on the Selden patents to bring to book concerns making or using goods claimed to be an infringement on patented devices. Heretofore patents have cut little figure in the automobile industry, or, at least, the gasolene end of it. The fear of infringement suits has seldom been seriously entertained, and up to this time the feeling of security has been warranted by the practical immunity enjoyed.

Boston's Show in Symphony Hall.

Symphony Hall has been secured by the Boston Automobile Dealers' Association for the holding of its forthcoming show, which will take place during the week of March 16. All but five of the spaces have been sold, and Messrs. Kerrison and Foster are in attendance at the Madison Square Garden this week booking exhibits.

Cudell Enters the American Market.

That old established concern, Cudell & Co., Aix-la-Chapelle, will have its goods handled in this country, arrangements having been made whereby J. C. Brandes will represent them in New York. A garage has been opened at No. 121 West Thirty-first street, and an office at No. 28 West Thirty-third street. The cars are built after the German De Dion-Bouton patents, with a number of the concern's own improvements. There are two models, 16 and 16 horsepower, respectively, both of them being tonneaus, with four speeds and a reverse, with single lever controls. These cars, together with delivery vans of any dimensions and horsepower, can be delivered within three weeks after receipt of order.

In addition, orders for other foreign cars will be taken at prices that are claimed to be 20 per cent under those ruling in this country. The special factory connections possessed by Brandes renders this scaling possible.

Moyea Elects Officers.

On Monday the stockholders of the newly organized Moyea Automobile Co. held a meeting in Madison Square Garden and elected officers as follows: Richard T. Wainwright, president; Sidney Dillon Ripley, vice-president; Henry C. Cryder, secretary, treasurer and general manager; directors, Richard T. Wainwright, Sidney Dillon Ripley, H. C. Cryder, Charles K. Beekman and S. Stanwood Menken. At the time of the meeting it became known that negotiations were pending for the purchase of a factory within the limits of New York City.

Offices of the new Moyea Automobile Co. have been established at 3 to 7 West Twenty-ninth street.

"Fournier" is Dropped.

Henceforth it is the "Searchmont Automobile Co." and the "Searchmont" car, the prefix, "Fournier," being dropped. The change is one in name only and will cause little surprise. The "Fournier" part has been more and more subordinated of late, and its final disappearance was a logical step. Fournier's connection with the company ceased more than a year since.

CHASE SUCCEEDS SCARRITT

Rhode Island Physician the new President of the A. A. A — Racing Rules Revised but Changes are Enfolded in Mystery.

After having run the organization during the first year of its life, the Automobile Club of America has relinquished the executive office of the American Automobile Association to the Rhode Island Automobile Club. President Winthrop E. Scarritt was tendered a renomination, but declined it.

The annual meeting was held on Tuesday afternoon, January 21, in the rooms of the Automobile Club of America. President Scarritt was in the chair, and Secretary S. M. Butler kept the minutes. The meeting was not a very enthusiastic one, although the treasurer, Jefferson Seligman, reported a comfortable balance in the treasury.

The following clubs were present: The Chicago Automobile Club, represented by Frank X. Mudd; the Long Island Automobile Club, represented by A. R. Pardington and Frank G. Webb; the Automobile Club of America, represented by Jefferson Seligman and J. M. Hill; the Rhode Island Automobile Club, represented by Dr. Julian A. Chase and H. H. Rice; the New Jersey Automobile Club, represented by W. J. Stewart; the Grand Rapids Automobile Club, represented by C. B. Judd; the Cleveland Automobile Club, represented by Windsor T. White; the Automobile Club of Philadelphia, represented by H. Bristol Brazier.

The following clubs, not members of the association, were also represented: The Albany Automobile Club, by Dr. Millbank and C. M. Page; the Cincinnati Automobile Club, by Max C. Fleischmann; the Massachusetts Automobile Club, by Dr. W. S. Shrigley; the Berkshire Automobile Club, by S. G. Colt.

The question of deciding as to the competition between amateurs and professionals was referred to the Board of Governors. It was reported that the racing rules had been thoroughly overhauled by the Race

Digitized by Google

Committee, and they were submitted for adoption, but before making them public it was deemed best to refer them to the clubs for their approval. The most important of the changes refer to track rules and to the classification of machines.

The Albany Automobile Club and the Cincinnati Automobile Club were elected to membership. The usual yearly reports from the various committees were made. Following is the list of officers elected:

President, Dr. Julian Chase, Rhode Island; first vice-president, Honoré Palmer, of Chicago; second vice-president, E. E. Schryver Reese, Cleveland; third vice-president, Charles F. Judd, Grand Rapids; treasurer, Harlan W. Whipple, Automobile Club of America; governors, Frank G. Webb, Long Island; Dr. Millbank, Albany; William J. Stewart, New Jersey; F. C. Lewin, Philadelphia; M. C. Fleischmann, Cincinnati; A. R. Pardington, Long Island.

197,454 Paid Admissions in Paris.

Paris, Jan. 1.—The close of the automobile show was the occasion of a banquet, at which about three hundred automobilists were present, and which was held in the new theatre attached to the Hotel Pastoret, which is the home of the Automobile Club of France, in the Place de la Concorde. The gathering, which was followed by speechmaking and a theatrical performance, was held on December 27, and was presided over by M. Michel Lagrave.

Monsieur Lagrave is the government commissioner chosen by the French Republic to represent it at the St. Louis Exhibition, and attended the banquet to represent the Minister of Commerce, and brought with him decorations for two well known automobilists, Mr. Max Richard and Mr. Louis Krieger. He also brought a message from M. Emile Loubet, the President of the Republic, to say that in commemoration of the exhibition he had signed a decree to the effect that all those "chauffeurs" who were condemned to suffer imprisonment for contravening the law of the road, should be pardoned unconditionally. Naturally, this announcement raised the enthusiasm of the meeting to its highest pitch, and great cheers were given for the President.

In order to show the increasing vitality and importance of the automobile trade in France, it is only necessary to cite the numbers of paid admissions to the annual show during the last five years. They are as follows:

1898.....	81,400	
1899.....	83,700....	Increase 2,300
1900.....	88,900....	Increase 5,200
1901.....	130,600....	Increase 41,700
1902.....	197,454....	Increase 67,000

This year the Grand Palais was completely packed with visitors each afternoon, and certainly next year, both on account of the visitors and on account of the exhibitors, the building will be too small. Opposite the Grand Palais, on the other side of the Avenue Alexandre III, there is the Petit Palais, and it may be found possible to join the two by a covered way, but this will necessitate stopping the traffic in the avenue during the time the show is open.

RACING—ON PAPER

Fournier and Winton Have Chips on Shoulders and the Cup Candidates Also Cause Comment.

It was natural that racing talk should be rife during the week. It began on Saturday night with the arrival of Alex. Winton, and was continued every day. Much of it was cheap talk, but the "yallers" made the most of it. According to some of the dailies, Winton, Fournier, Oldfield, Mooers and Matheson were as free with challenges and "defis" as pugilists who do not intend to fight.

When Alex. Winton arrived last Saturday he said that he was willing to race Fournier, but would not contest for cash. The stake must be a cup, and the date some time after July 25. As he believes the Cleveland track the fastest in the country, Mr. Winton stipulated also that the race should be on it.

Fast or slow, the track at Cleveland, or rather Glenville, O., would not do for a race, because it would not be in line with the plans of the press agent who first inspired the challenge from Fournier to Winton. Consequently Fournier replied, suggesting a series of three races and naming the Empire track at Yonkers, N. Y., for the first one, the Cleveland track for the second and a neutral course for the third if it proved necessary. Fournier also disclaimed having ever raced for cash (he said nothing about receiving "appearance money), and slyly hinted that Winton having raced against a professional (Oldfield) was not exactly a sainted amateur.

There the matter was allowed to rest for the time being, and the attention of the newspaper men was directed toward getting statements from Henry Ford and L. P. Mooers, both of whom were made to say that he was willing to meet the winner of the Fournier-Winton race.

Repeated efforts were made during the week to learn what the cup race candidates are building in the way of racers, but they were all very careful not to give out any information of consequence. A Motor World man in drifting about learned some things of interest, however. Messrs. Mooers, Harkness and Matheson all were free enough to admit that they would use four-cylinder engines, but would give no idea of their horse power. Mr. Winton will use a horizontal engine, but what its horse power or location in the car will be he did not say.

From whisperings here and there it is believed that Mooers and Matheson will have cars of very big horse power, something probably in the neighborhood of 100. The story about his building a car of 150 horse power was laughed at by Mr. Matheson, and he said that it did not originate with him. He admitted though that his two cars would be of high horse power. Mr. Harkness admitted that his car is being built in New York city after designs of his own. It will not be a replica of any particular make, but will embody all the latest improvements. From what he said he does not favor very high horse power, believing it to be unnecessary. Mr. Winton, the most reticent of all, is understood to agree with Mr. Harkness about high horse power being unnecessary.

One gratifying thing seems certain, which is that none of the cars will be freaks. From what could be gathered the Winton candidate is apt to be the only one with a specially designed racing shape of body. It was rumored that the Winton car would be like the "Bullet," "only more so." The Mooers car will be a true Peerless, and will probably be run simply stripped, and the same was given to be understood with regard to the Harkness and Matheson cars. Mr. Harkness said that his car would be entered in the Paris-Madrid race whether he was selected for the cup race or not, and that a tonneau body would be shipped with the car, and he would prove that his car was not a freak by fitting it to the racing frame and going touring with it after the races.

Mr. Matheson was very enthusiastic and very confident about the success of his car. It would, he said, be very much like the Mercedes, but not exactly. He said that the frame would be the same as that of a touring car only much lower, the flywheel being only four inches from the ground; his car, he added, would be on hand April 11, and that he was willing to enter any contest prescribed by the committee. If he broke down he would not ask for a second trial. If one of his two cars is selected, he will drive it himself, and he, like Harkness, said he would go over and enter in the Paris-Madrid race if not selected for the cup. Messrs. Mooers and Harkness and Winton all declared that they would be ready on the date set by the committee to have the cars in New York, and yet nearly all the candidates expressed doubts of the others being ready on April 11.

Where the Limit is 25 Per Hour.

An extremely liberal speed limit, but rather onerous restrictions in other respects, are contained in an automobile ordinance that has been adopted by the Board of Supervisors of San Joaquin County, Cal.

It limits the rate of speed on the county roads to twenty-five miles an hour, with the provision that when within 500 feet of a horse or other domestic animal attached to a vehicle, the speed must be reduced to four miles an hour, or, at the request or signal of the person in charge of the animal, the machine must be brought to a full stop. A bell, horn or other signal must be used on the automobile, and when the machine is run on the public roads between one hour after sunset and one hour before sunrise one lamp must be displayed in front or one on each side.

For a violation of the ordinance a fine may be imposed not to exceed $100.

Bristol Purchases a Plant.

The recently organized Bristol Motor Car Co., Bristol, Conn., has purchased property formerly occupied by a portion of the plant of the Sessions Clock Co., and will at once commence the erection of a large factory building.

CANTOR'S QUEER ACTION

Calls an Unexpected Hearing to Advocate new Speed Law, Which, However, Proves Sane.

Borough President Jacob A. Cantor of Manhattan, New York, on last Monday moved upon the camp of the automobilists, cyclists, truck owners, cabmen and others who for nearly a year have been seeking to obtain the passage of an ordinance regulating street traffic that would embody a sensible rule as to the limit of speed in the metropolis, and the result of his move was the complete rout of the organizations that have been working for the passage of the ordinance introduced last May by Alderman Joseph Oatman, which has all along had the support of the A. C. A. and the N. A. A. M. This was accomplished at what looked very much like a "snap" hearing before the Law Committee of the New York Board of Aldermen, called during the week of the Automobile Show, when the automobilists were not likely to attend. Altogether the hearing had a strange and mysterious phase that puzzled those who have been following the traffic ordinance or "rules of the road" proceedings.

The meeting was called by Borough President Cantor ostensibly for a hearing on "the traffic ordinance." The traffic ordinance with which every one has become familiar was not discussed a little bit. This is the one introduced by Alderman Oatman, to which no objection has been made except with regard to the clause concerning the speed limit. Otherwise it was indorsed by all as just the proper article. Instead of this ordinance, or the speed clause in it, which has been the only portion discussed, being taken up, the talk turned entirely upon a brand new set of "rules of the road," drawn by William P. Eno and introduced, presumably as a substitute bill, by President Cantor. Now, the ordinance originally introduced by Alderman Oatman called for a uniform speed limit of ten miles an hour throughout the city, which was sensible and good enough to satisfy the automobilists, drivers and all others, but the Committee of Fifty had hysterics over it and insisted upon the old limit of eight miles an hour, established before automobiles were common in the streets, being retained. As a result a compromise was effected in an amendment, to which the Automobile Club and the Committee of Fifty both agreed, making the speed limit eight miles an hour in the populous parts of the city and fifteen miles an hour in the outlying districts.

The new ordinance, drawn by W. P. Eno, who poses as "simply a public spirited citizen," returns to the original ordinance so far as the speed limit is concerned, calling for a uniform rate of ten miles an hour all over the city. In other respects the ordinance is substantially the same as the Oatman ordinance, but it is more brief and not so explicit and legally well guarded in phrasing, while it is more strict as to the rules with regard to blocking the streets, and more severe in its penalties. It calls for a minimum fine of $1 and a maximum fine of $50 for violation, and this may be imposed upon a truckman who chances to delay a car while unloading his truck during business hours. The maximum penalty in the Oatman ordinance is $10.

The hearing was peculiar in that it brought to the front an entirely new contingent of speakers. The regular advocates and obstructionists of the former bill were missing or strangely silent. The Committee of Fifty and the West End Association, which so bitterly opposed the limit of ten miles an hour heretofore, were absent, and so far as the hearing went it looked like a bill being "railroaded," for no one spoke against it. All present seemed to be friends of President Cantor or Mr. Eno and his bill. As the ordinance is really a sound and sensible one, perhaps this was just as well.

President Cantor started the ball a-rolling by saying that this was a concise and good ordinance that should be passed and enforced, and he recommended that the Board of Aldermen after passing the rules should address the Police Department requesting that trained and efficient policemen should be stationed throughout the city to enforce the rules and prevent the streets from being blocked by careless and obstinate drivers and motormen.

W. W. Niles, counsel for the Automobile Club and the N. A. A. M., said that the automobilists and the Committee of Fifty favored the amendment to the Oatman ordinance which permits of a speed of fifteen miles an hour in the portions of the city not built up. He then left the room. After that half a dozen men and one woman—a Mrs. Ralph Trautman—took turns in extolling the new set of rules and urging their approval by the Law Committee. Alderman Oatman was present, and so was Jefferson Seligman, but the only part they took in the discussion was to explain certain points in relation to the new rules, which were the only ones to which any reference was made.

A representative of the Road Drivers' Association, Railroad Commissioner Cole, Counsellor Root of the Interurban Railroad and Josiah C. Pumpelly, secretary of the City Improvement Society, all new men at these hearings, spoke earnestly in favor of the new rules. Chairman Armitage Mathews and his associates listened stolidly, as usual, and gave no indication of what they would report.

Boston Pioneer Dead.

Boston's pioneer automobile tradesman, P. C. Lewis, of the Automobile Headquarters, 66 Stanhope street, died on Sunday last. Out of respect for his memory, all the automobile stores, garages, etc., in Boston were closed on Tuesday afternoon from 2 to 3 o'clock, when the funeral took place.

GERM ATTACKS GOVERNOR

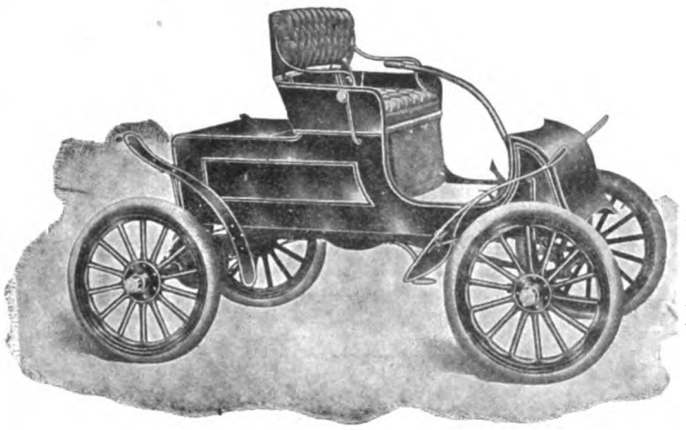
New Jersey's Varnish-Making Executive Develops Motorphobia and an Onerous Law Follows.

New Jersey's Executive is "agin" the automobile, or at least he strongly urges restrictive measure of a drastic character, one requirement being the passing of a "suitable examination" before being allowed to operate a motor vehicle.

In the annual message of the Governor these passages occur:

"The increasing use of automobiles, and the record of accident and death caused by them, make it important that the legislature should pass a law regulating their use. They are machines which, as every one knows, may go anywhere. If a man is to drive a locomotive engine he must serve years of apprenticeship as a fireman and undergo successfully a rigid examination as to his duties. And the locomotive engine is confined to a carefully built track, from which it is never able to move very far. An automobile, with its power to run wild, is now allowed to be driven by men, women or children, who in the majority of cases have little knowledge of machinery, and when the thing goes wrong, as it frequently and suddenly does, they are helpless.

"A record of the accidents of the last year would be a long and sad one. In the interest of the lives and comfort of the community, I ask the legislature to pass a law that will require a suitable examination to be passed before any one may be allowed to drive an automobile, and that no automobile shall be allowed in this State that is geared to run at a higher speed than fifteen miles an hour. If, because of the construction of certain machines, this is impractical, definite speed regulations in such cases might be defined."



Immediately upon the convening of the New Jersey Legislature at Trenton on Monday Assemblyman Scovel, of Camden, introduced a bill that provides for a Board of Automobile Examiners, the five members to be appointed by the Governor. Under the terms of the bill each person who desires to operate an automobile in the State must go before the board and be examined as to fitness for so doing. The license to be issued will cost $5. The measure seeks to fix the speed limit at fifteen miles an hour and a fine for violation of the law.

Tinkering With Connecticut's Sane Law.

Autophobes are endeavoring to change the present highly satisfactory automobile speed law in Connecticut. In place of the maximum rate of fifteen miles per hour now permitted, a speed of eight miles is proposed. A bill was introduced in the legislature last week by Assemblyman Warren, of Lyme, providing that "automobiles or other horseless vehicles shall not be run over the country roads in this State at a rate of speed in excess of eight miles an hour, under a penalty of a fine of not less than $50 nor more than $100. As the present law is really a model of charity and fairness, its alteration would be a source of regret.

NEW YORK, JANUARY 22, 1903.

The What's What of the Show.

Eye-opening the present show must be characterized, and as the days pass and the many genuine novelties are more closely examined the wonder grows.

Not even those supposed to be "in the know" were prepared for such a showing of entirely new and advanced types of cars. For once factory secrets were well guarded, and scarcely an inkling of them was permitted to escape. As a result the surprise was all the more complete when the seal of secrecy was at last removed and the cars exposed to public view.

These innovating cars are not confined to one stand, nor to two or three or half a dozen. The show is flooded with them. Instead of being confined to any one power, they embrace all three. They run the gamut from radical reconstructions to comparatively unimportant changes. Taken as a whole, they mark the closing of an epoch and the begining of a new era.

Consequently there is little uncertainty about the present show. The various tendencies and trends are clean cut and unmistakable. One can easily read the immediate future; and while there may be doubt as to ultimate happenings, there is none about present ones.

For the moment gasolene holds the centre of the stage. It dominates the show and even the industry. It is the rage, the fashion, the mode, the craze of the day. To it makers bow down as before a devastating storm. This extraordinary popularity is incontrovertible. But in spite of it electricity has quite held its own, has gained some ground even. Makers of electrics are full of confidence, and their number has been augmented—a sure sign of prosperity.

Tonneau bodied, bonneted, long, low and rakish looking steam cars of the gasolene type have made their appearance. They are received with enthusiasm, and their makers congratulate themselves on their perspicacity in divining the trend and preparing to meet the demand. No doubt is entertained that this will be large.

In the gasolene field a very pronounced tendency is observable. The multiple cylindered, vertical engine, placed front under a bonnet, with transmissions by shaft and bevel gear or individual chains to wheels, tonneau bodies and similar features that have heretofore been found mostly on foreign cars, are, for the first time, in a majority. This is true, even if cognizance is taken only of American cars. With those of foreign manufacture—all of which, of course, are of this type—included, the showing is even more impressive.

Whether right or wrong, permanent or ephemeral, this type of car is the favorite. There is no dodging that fact. Friends and foes alike must recognize and acknowledge it.

The horizontal motor—either single or double—type of car is a good second. The light runabout claims most of the single cylinder engines, and there is a considerable increase in the number of medium powered, medium weighted cars. Many of the latter are fitted with blind hoods, used to stow away tanks and supplies.

It is noteworthy that a decided and altogether unexpected advance has been made in the matter of commercial vehicles and closed cars.

The latter were seen on a little less than a dozen stands. Small as this showing is, however, it is decidedly encouraging. As the Motor World has frequently pointed out, if the automobile is to become an all-the-year-around vehicle, and not merely one usable during pleasant weather, it must be built with inclosed bodies, thus making it an actual competitor of the horsedrawn vehicle. Some of the cars of this class shown merited and elicited much praise.

It is made plain at last that the commercial vehicle is being taken up in earnest. The number of vehicles shown is large, and in nearly every case they are contracted for or sold. Heavy trucks make the best showing, but the light delivery wagons are far from being sidetracked. There is more willingness shown by makers to undertake the construction of vehicles of this class, as well as a gratifying readiness on the part of commercial houses to invest in them, showing a confidence on both sides that is undoubtedly well founded.

No one can turn from a survey of the show without a feeling that it is one that in every way reflects credit on the industry.

The improvement has been general. There are some beautiful specimens of cars building, and while even yet the refining process has not set in to anything like the extent that has marked it abroad, it is easy to see that our makers are on the way.

In fact, the show is quite as important for the promise it holds out as for what has actually been accomplished. A year hence there will be little to excuse and less to be ashamed of, and infinitely more to praise than even now.

Its Influence on the Man.

On more than one occasion stress has been laid on the immense good the automobile will accomplish by bringing home a certain amount of mechanical knowledge to men in the non-mechanical walks of life.

The man who does not know how to wield a screwdriver or wrench, or even to tell the difference between a worm and a spur gear, has no business operating a motor vehicle, and, tried by such a test, the average intelligent American would emerge triumphantly. He "knows his way about," as far as the rudiments of mechanics are concerned, even although he may never have done a stroke of mechanical labor—professionally—in his life.

But much more than a knowledge of the rudiments is required if one is to have much to do with an automobile—whether the relation is to be that of salesman or user. The more knowledge he possesses the better he will get along. A smattering may answer for a while; but sooner or later the consciousness is borne in upon one that at least a half

Digitized by Google

way acquaintanceship is necessary if one is to be more than a pawn on the automobile chessboard.

It is because of these facts that we see to-day a determination shown to acquire the requisite knowledge of automobile construction.

Dealers and salesmen, demonstrators and repairmen go to the factories to study the subject at first hand. They want to know, to learn the how and why of things. There are a hundred different points to be settled, all of them interesting, many of them important. To dissect, inquire, probe, to store up facts that will prove useful in the future, to acquire knowledge that will shed light on the mistakes of the past—this is the work they address themselves to, resolutely and with hearty goodwill.

The same thing—only, of course, to a lesser extent—is going on among users of automobiles. They soon learn their shortcomings and to admit the value of overcoming them. Knowledge is power, and in the case of the automobile it is also an insurance against breakdowns—a lightning rod erected to intercept and conduct to a place of safety unwelcome visitations in the shape of choked carburetters, imperfect-working ignition systems, enigmatical engines, etc.

Out of it all will undoubtedly come an immense amount of good.

Cars will work better and give better results in the hands of their operators; simple troubles will be lessened, and when they do develop they will be more quickly traced to their source and put to rights. Cars will not be so subject to ill handling and abuse. The intelligent driver will better appreciate the limitations of the fine piece of mechanism that has been placed in his hands and govern himself accordingly.

End of the Mysterious Era.

In former days State secrets were no more jealously guarded than those of automobile construction. We have only to go back in memory to the time of the first automobile show, held in 1900, to recall what a "holy of holies" cylinder dimensions, transmission gears, carburetters, wheel bases and such like details of construction really were.

There was a general and a very emphatic disposition to keep these fundamental "secrets" locked up in the inmost recesses of the maker's strong boxes. They were his stock in trade, acquired at much cost, after great expenditure of gray matter, and quite invaluable. Should they be disclosed, rival makers would discard their old, obsolete patterns and begin making replicas of the ones just placed within their reach. A close mouth was kept always, and not even customers could prevail on their principals to violate the sanctuary.

Even when the 1901 show took place—a little over a year ago—matters in this respect had not improved very much. There was still profound reticence preserved, the same shocked astonishment expressed at the thought of "giving up" particulars relating to construction.

But what a change has taken place—a change as complete as even the most indefatigable delver into the "innards" of cars could desire.

There are to be seen at the present show working models of almost every part of the motor car. Most of them are put up especially for demonstration purposes—to give away the "secrets" that were at one time guarded so closely. Chassis, engines, transmission gears, carburetters, boilers, ignition devices, systems of control—all are there, in such simple, seeable shape that he who runs may read, and, reading, ponder, digest and understand.

Only in a few cases do "secrets of the designing room" still exist. The steadfast refusal to reveal them has been replaced by a willingness, nay, an anxiety, to spread them broadcast, to dwell upon them, and thus further the cause of educating the great public.

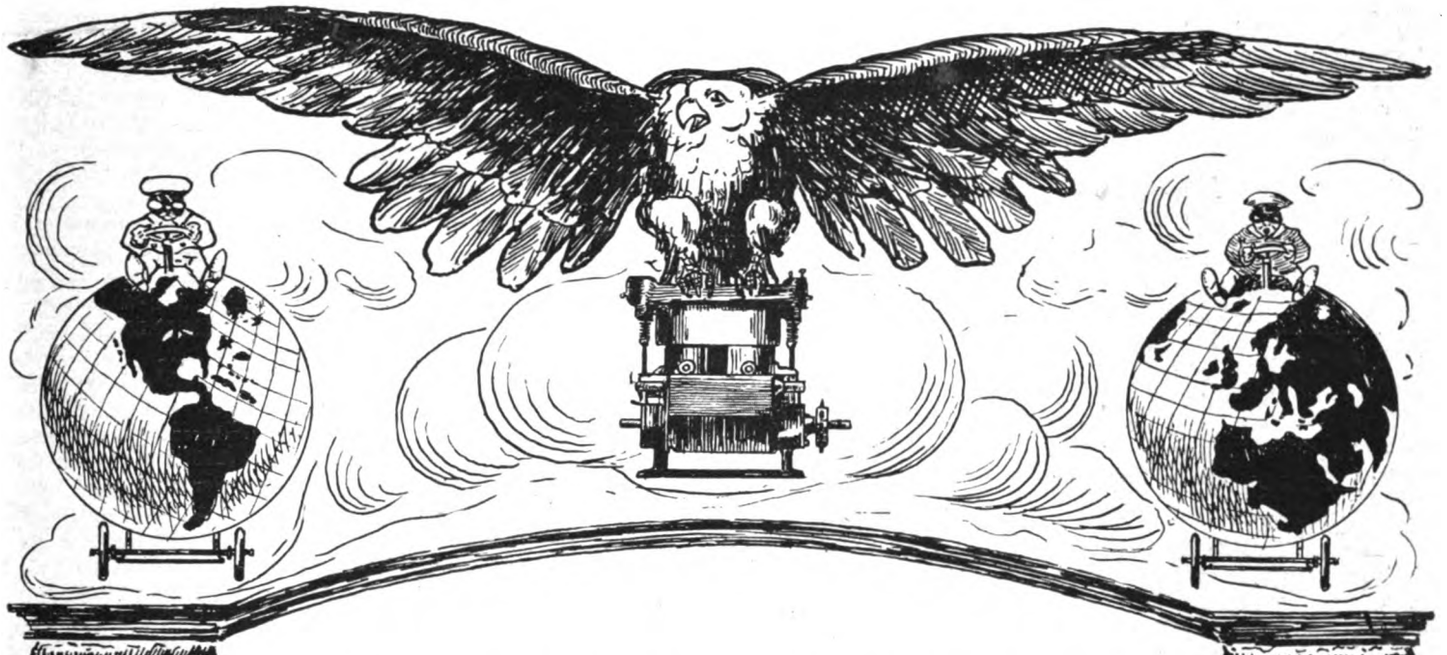
The change is a welcome one, and as sensible as the former attitude was silly. The man who wanted the information for a nefarious purpose could always obtain it in some manner; he had only to take a little trouble and examine a car of the desired make, or, at the most, purchase one and dissect it at his leisure. The honest man, the present or prospective user, the student, the pressman, on the contrary, thus rebuffed, often desisted from the attempt to acquire the desired knowledge.

It is significant that this forsaking of false gods should be contemporaneous with the present epochal development in American automobiles.

It is equivalent to serving notice that the American car, like the American locomotive, machine tool or other production of the metal worker, has no need of concealment, no fear of competition. It stands on its merits and invites, instead of repels, comparisons.

Who will deny that the tide has turned, that the automobile is ceasing to be the object of popular execration? A Connecticut prosecuting attorney has ordered the release of a man who for seven months has been under the stigma of having committed manslaughter, and the Journal and American, of this city—that forefront of offending, that yellowist of yellow journals—turns a somersault and indulges in the most pyrotechnic of eulogies anent the motor vehicle! Plainly, there is hope of rational consideration of this most wonderful and civilizing of vehicles. It will soon become possible to be an automobilist and yet remain a law abiding citizen.

As yet shows in this country lack some of the spectacular features that mark them abroad. The eclat of the opening—with the President of the republic as sponsor—the brilliancy of the scene, the throng of distinguished and fashionable spectators, the elaborate, costly and magnificent stand decorations—these concomitants of the Paris functions are not to be found here just yet.



But if the premier American exhibit loses some of its lustre by comparison with its Paris sister, it is still a solid, substantial and almost wholly satisfying show. Its success cannot be gainsaid. This is true whether it be gauged by the standard of dollars and cents—as exemplified in the sales made—or that of its educational value. Both are of a pronounced order.

If the autoist who knows pretty well what sort of a car he wants comes away from the show without having made up his mind—as sometimes happens—what chance is there for his fellow who goes to the annual exhibition to have his doubts resolved? Each car examined leaves him more in doubt. It is an invaluable salesman, then, who is able to convince him that his car is the best and clinch the sale on the spot.

An eight cylinder motor was on exhibition at the Paris show, and from more than one quarter we are promised cars rated at between 100 and 150 horse power for the 1903 races. But we cannot help asking ourselves whether the mark has not been overshot. These figures do savor of the impracticable.

We no sooner reach the stage of finality, the period when further improvement is impossible, than lo! the air is full of changes, of improvements of all kinds, and makers fall all over each other to get in line.

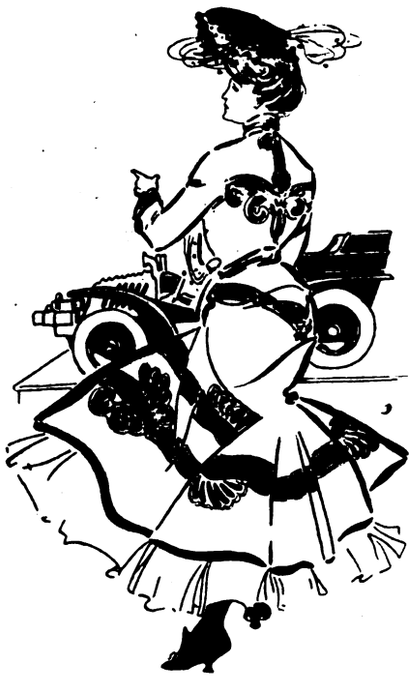
SHOW PROVES A REVELATION

Surprises of all Sorts Develop Showing Even Greater Progress Than had Been Foreshadowed—Nearly a Score of Unexpected Models Make Their Appearance—Touring Cars Rampant, and Closed Cars and Commercial Vehicles Conspicuous—Many new Mechanical Features Also Uncovered—What They are and Where They are to be Found.

Eye-opening is the term which best describes the New York Automobile Show of 1903.

Neither the President of the republic nor the Mayor of the city was present to inaugurate the function by strewing flowers of speech on the industry; but neither the show nor the industry felt the lack. The doors of Madison Square Garden opened without blare of any kind on Saturday evening last, and the crowd flocked in, and, excepting Sunday, of course, have continued to flock each afternoon and evening since. It is a well bred, well dressed, well groomed crowd—probably the most select of the many that attend the succession of public functions held in the Garden, not even excepting the Horse Show. While the latter is a thumb-marked "society" event, "society" is on show in the boxes and the rabble is attracted to view the buds, blossoms and fading lilies of the upper strata. "Society" is almost as numerously in evidence at the Automobile Show, but she is neither on parade nor is she a boxed or advertised adjunct; and automobiles, themselves having small attraction for the "vulgar thorng," the "vulgar throng" is conspicuously absent; the result is probably the best average crowd that the Garden lights ever illuminated. The show itself is far better ordered than its two predecessors. There is an agreeable diminution of the promiscuous horn-tooting and gong-clanging that marked the previous affairs.



It is not the character of the attendance, however, that caused the opening of eyes, nor is it the eyes of the casual visitor that have been opened. It is the trade's own lids—the lids of those who presupposed that they were familiar with the productions of the industry and with what the show would hold that were lifted. Before the opening some of these had canvassed the intending exhibitors, but, shrewd fellows, not all of these exhibitors told all they knew or detailed all that they would display.

As a result the show has proved rich in surprises, and surprises of the sort that delight the hearts of those who believed they had seen the direction in which the industry should trend, and in which, though appar-

Digitized by Google

ently plainly indicated, the trade seemed unduly slow to turn, i. e., toward those classes of vehicles that would make of the automobile more than a fair-weather conveyance of pleasure and persons.

The showing of closed cars and commer-

AN "AUTOMOBILE GIRL"—PERHAPS.

cial trucks and wagons is such as to indicate quite clearly that the trade is now inclining seriously in those directions. Until the present exhibition practically only the makers of electrics had devoted themselves to vehicles of the kind, and, though they are still in the vanguard, both steam and gasolene must henceforth be included in the reckoning.

The Locomobile limousine, the Olds coupé and the Berg coupé are genuine surprises in the matter of gasolene vehicles; the same is true of the Mobile coupé as regards steam. These, with the electric coupés and hansoms, to say nothing of the Locomobile, Long Distance, Pope-Robinson and other big touring cars equipped with tops and glass fronts, make a brave array of closed and semi-closed vehicles that point the way to the general all-year-'round use of the self-propelled conveyance.

In commercial vehicles the Columbia truck and the splendid diversity of the Vehicle Equipment Co.'s heavy trucks and wagons show that electrics point the way, but the White, Mobile and Locomobile delivery wagons—not the light, toylike creations of previous years, but big, substantial counterparts of the horse-drawn deliveries—are steam developments that are not to be minimized, while the Long Distance wagon, though smaller, and the Union truck are evidences that at last there is more than one American maker of gasolene vehicles bent on tilling the field which has been so often pointed to as the one promising the richest reapings of the future.

Of course, the great predominance of runabouts and touring cars dwarf everything else, and perforce the closed car and commercial vehicle are not of prime public interest, but to people who are not given to bird's eye views or to casual consideration these features are full of meaning. They make for general utility and for a stability of the industry that cannot be effected by the whims of fashionables or would-be fashionables.

In the field of pleasure vehicles the tonneau touring car is rampant. They are of all sizes, all powers, all prices—large, small and medium, gasolene, steam and electric. The maker who has not an out and out touring car or who has not a tonneau attachable to his runabout is the exception, and a rapidly lessening one, and all are inclining to the touring car as a distinct model with sufficient power for the added load. The term "touring car" in itself conveys pleasurable suggestions of agreeable companionship and extended jaunts, and its increased and increasing popularity is not surprising. The

big, richly upholstered, tonneau bodied Columbias, Wintons, Yales, Stearnses, Packards, Searchmonts, Bergs, Autocars, Pan-Americans and Moyeas, to mention but a few, seem the pinnacle of inviting luxuriousness in road cars. They are high powered and high priced, and are fit to compete with any car turned out in any country; in fact, it is to be remarked that, whereas at the previous show the foreign built Panhard, to cite an instance, was the pivot on which eyes and tongues turned, it is this year but one of the many and no more talked about or sought after than the American cars of its class. The development of the steam touring car also was more marked than had been anticipated. The White and the Grout had been forepictured, but the Toledo and the Meteor were absolutely unheralded, nor was it known that the Locomobile had one in preparation until the photograph was displayed. Of the medium sized, medium priced touring cars the Conrad, the Thomas, the Olds and the Elmore are good examples, and, being within the means not only of the very rich, but of the well do do, will doubtless endure and be not of restricted sale. Certainly touring cars of this type leave no field for the stiff backed and homely surrey.

The runabout also has undergone something of a transformation. It no longer is merely a box or buggy on wheels, nor is it as lightly built or as toylike in appearance. It has developed features of its own, what might be termed the "nose" being the most distinguishing feature. It is more than a dash, it is less than a bonnet, and "nose" is not a half-bad term, the shapes differing almost as variously as the human probiscis, although in one case, the Conrad, the frame and body is projected sufficiently far forward to permit the use of a full fledged square bonnet.

Delving deeper than mere shapes or appearances, the show proves how advantageous is the annual gathering under one roof of all vehicles, to a new industry at least. No man who has engaged in such delving but that will leave New York or remain in New York with a higher regard and greater respect for the automobile industry of America. Heretofore he has had it so dinned in his ears that the home product was five years or so behind the foreign article that he has either half or wholly believed it. Because of the fact he has been more intent on awaiting and examining and remarking and exploiting the features of the European cars. It is not to be denied and no attempt is made to deny that the American trade has assimilated foreign ideas. The tonneau body, the vertical motor, bonnet front, direct drive and other things came from abroad, and are freely acknowledged. But only a month ago word came that mechanical valves constituted a sensation of the Paris show and straightway the comment again went the rounds respecting the backwardness of American manufacturers. But, bless you, here is this show in Madison Square Garden proving that the Oldsmobile, the Rambler and other cars have been using those very valves for more than a year, and no great furore was made about it. The same reports from

"REAL THINGS."

Paris said that square bonnets, compensating carburetters and honeycomb radiators were developments. But there are square bonnets, compensating carburetters and honeycomb radiators on several of the American cars in the Garden, and they were in ex-

Digitized by Google

istence long before the Paris show opened its doors. The cables told us also that a combined gasolene and electric car was another Paris sensation. There is one in the Garden and it has been on the roads hereabouts for six months or more. It is probable that if a French maker or a German maker had had half the success the Elmore people have had with their two-cycle motor another cabled sensation would have resulted and Americans generally be discussing or developing two cycle motors.

The American manufacturer is not five years nor five months nor one month behind his European rival. In the Mors, the Peugeot, the Renault, the Darracq, the Fiat, Europe has some of its most admirable productions side by side with those of America, and few there are who will maintain that the latter suffers by comparison, indeed, it is safe to say that in the means and methods of throttling and control, and in the elimination of the bothersome starting crank, in readiness of access to valves and spark plugs and other ignition apparata as exemplified in the Columbia, the Toledo, the Pan-American, and the Locomobile, are developments that Europe may well turn to its profit as some of its ideas have here been advantageously adopted or adapted.

Dating from this year's show the American industry will "feel its oats" and cease to consider itself second to any.

That the decision is justified nearly all who digest the volume of description which is spread on the pages which follow must agree. The Motor World has delved deep and thoroughly and has not sought to deal in platitudes or generalities, or to summarize or gloss over the wealth of development and progress that is contained within the show. It has dealt with the subject exhaustively and those who are seeking light and who would learn what a splendid and inspiring revelation the show really is will discover it in these pages. The revelations relate not merely to the dominant gasolene power, for it will be found that the White, with its new compound engine, and the Mobile, Grout and Prescott contribute in varying degree to the improvement of the steam vehicle, while all of those makers who deal with electrics have, without exception, made substantial developments. The famed Gee-Whizzard of Menlo Park, and his unripe and newspaper exploited battery has been having a bad time endeavoring unavailingly to "make good" and which, were the Edison reputation less glowing and reporters less guillible, would long since have ceased to be heard of.

It is not alone in vehicles, that newness and ingenuity are to be found. In the tires and accessories and sundries much is to be learned or seen that was not known before. The Diamond Rubber Company's non-blooming inner tube is one important "find"; the G. & J. tire with smooth tread, that is, minus its long familiar corrugations, is another, less important, but still of interest. The Goodson igniter and A. H. Funke's pointless spark plug and his interchangeable candle and carbide lamp are but instances of the novelties that the show has brought into the full light; they are but a few of the many that are dealt with in detail in their respective departments of the succeeding pages. To recount them here would be tautology.

As a spectacle the show is brilliant, but not impressive. The roof of the Garden is half hid by alternate loopings of white and lemon-hued bunting and the same color scheme aided by festoons of the national flag and national color; also the French colors (sub-rosa, most of the decorations was left over from the so-called French ball of the week before), is carried into the basement, styled the "Exhibition Hall" by the management, nicknamed the "sewer" by some of those whse exhibits are "down below." But few of the exhibitors have indulged in such ornate and artistic signs and railings and elaborate decoration as photographs show and visitors have said marked the Paris show. And incidentally, M. M. Clement, Charley Fournier and several of his colleagues from across the pond are much in evidence. Fournier, with a moustache having upward tendencies which indicate that it is not alone French cars that bear evidence of Germanization.

Of the exhibits, that of the Mobile Company of America, is the most striking. Columns of white and gold surmounted by milk-white globes surround the space and distinguish it from all others. Baker, Winton, the International Motor Car Company, and a few others spell their names in electric lights, and also with others employ potted plants to set off their exhibits, but otherwise all is commonplace. This applies to the main hall. In the basement, the Central Automobile Exchange makes a brave effort with festoons of evergreen, but here, as in the crowded restaurant, the ceilings are too low to make decoration effective or worth while.

There is a praiseworthy effort to enlighten the public and make plain "just how it works." The chassis is numerously in evidence that all may see the location and disposition of the various fundamentals, while magnetos and spark plugs and Splitdorf's big coil are shown sparking. The ban on gasolene forbids the operation of motors indoors, but by employing dynamos the Whitney Chain Company, shows a series of their chains, each of different size, in motion. C. E. Miller shows the operation of a water pump, and the Veeder Mfg Co. exhibit the operation of not only their odometer, but of the tachometer or speed indicator.

Outside the Garden, many of the exhibitors keep each a car or cars for practical demonstration, and despite the agreement to the contrary "free rides" are the rule.

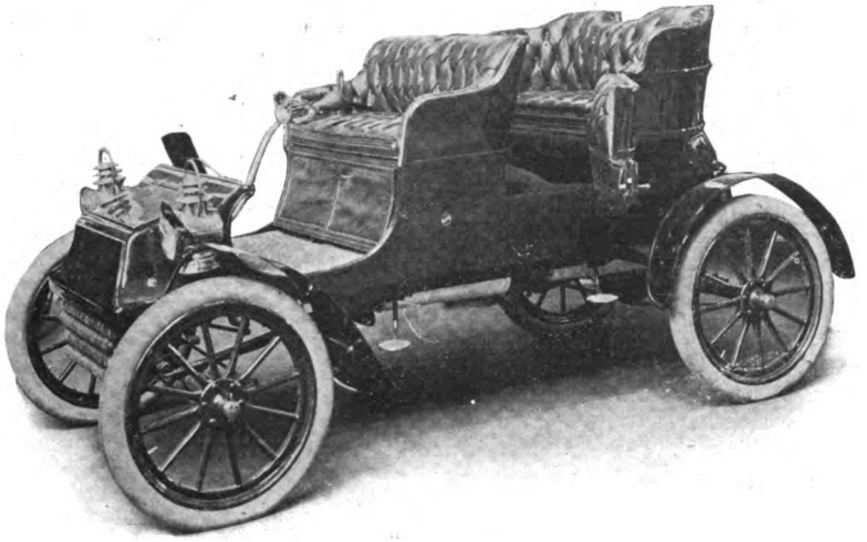
The attendance, too, is a record breaker. Up to Wednesday night, according to Secretary Young, of the Garden Company, the paid admissions were three times greater than for the corresponding period of last year, while the sale of "trade tickets" then totalled 8,600, as against but 1,900 during the entire show of 1902.

Gasolene

Bristling with genuine novelties as the show is, it is the gasolene car section in particular that is filled to repletion with them. They demonstrated impressively the great advance that has taken place, and more than hint of the mighty strides that will be made by the time another year rolls around.

Little more than a year ago a distinguished French autoist, thoroughly versed in the best foreign constructional practice, who visited this country, remarked in a disparaging if not contemptuous way that American automobiles were five years behind those of Continental origin. Since then no inconsiderable number of other and almost equally distinguished foreigners have visited this country and examined the product of our factories. Without exception they have echoed the opinion quoted, and thought, and sometimes expressed, similarly uncomplimentary things. Not until American makers forsake their idols and adopt the practices in vogue abroad will they progress, they said in effect.

Judged by this standard—which is, of course, an arbitrary one, made to fit a condition that exists chiefly in France—the American motor vehicle has at last been emancipated, and to-day there are American cars that are worthy to be placed alongside the best product of foreign factories and compared, point by point, with them, without the slightest fear of suffering by comparison.



All of which may be much more tersely expressed by saying that many American designers have taken by the bull by the horns, produced cars of the extreme foreign type and improved upon them.

Such cars have undergone Americanization. The influence of the Gaul and the Teuton is there, but underlying it, and at times pressing it hard, is American ingenuity and the disinclination to call a halt before the goal is reached. Consequently Americanisms abound. The innovator has been busy, and some of his work is of an eye-opening character, calculated to start an

Digitized by Google

American movement to take its place with the German one that is so much in evidence just now.

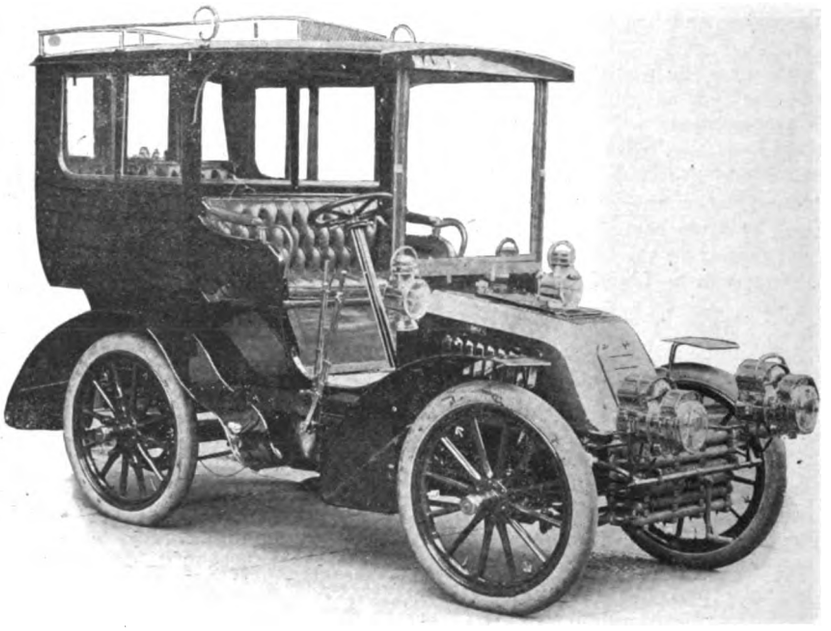
It is undeniable that in the battle between the types the so-called foreign car is very much in evidence—perhaps too much so. It

OLDS TOURING CAR.

is as if the American makers had, after being for years taunted by Frenchmen with being unable to produce the French type of car, at last turned to and beat them at their own game, had out-Heroded Herod and "gone them one better."

The result is a number of cars that are real road locomotives—big, powerful, speedy, heavy and costly. The best foreign cars—Mercedes, Mors, Panhard, etc.—have been taken as models and closely followed; but instead of stopping short there the designers have gone on and incorporated feature after feature having as their object greater convenience, accessibility or utility. In short, American mechanical ingenuity seems to have been given full swing, and the result is both remarkable and gratifying. These cars for the moment overshadow all others. They rivet attention, are examined closely and discussed freely. For the time being they dwarf everything else.

In view of all this one almost loses sight of the fact that as far as the American cars at the show are concerned they are almost equally divided between the vertical and the horizontal cylinder types. At the same time the single cylinder is in a hopeless minority, as is the centrally or rearwardly positioned motor to a somewhat less extent.



Only the light cars—the runabouts—are now equipped with single cylinder motors, the Olds, the Rambler, the Cadillac, etc. Others of greater weight, such as the Haynes-Apperson, the Autocar, the Elmore, the Century, the F. B. Stearns, employ the double cylinder horizontal type of motor. These cars really form the mainstay of the opposition to the vertical cylinder motor, and demonstrate convincingly that power and speed, as well as reliability, can be obtained without having recourse to the vertical motor.

The mechanically operated intake valve is seen on two widely differing classes of cars. One, of which the Olds is the most conspicuous opponent, always has used this method of opening the valve. The Olds half-time shaft has cast on it two cams, one working the exhaust and the other the inlet valve. The Rambler and several other light cars use systems very similar. The other cars referred to are the latest, most advanced type, such as the Pan-American, the Electric Vehicle car, etc., and they use the same method as the Mercedes car of a year ago and the leading French cars seen at the Paris show.

That other Mercedes innovation, the direct drive on the high gear, is also employed quite numerously. The same is true of the honeycomb radiator in some of its many forms, throttling the mixture at the intake valve—exhaust throttling being quite out of favor—carburetters with variable air supply, the use of hot water pressure on the lubricating oil tank or of oil heating devices, such as placing the tank near the motor or exhaust; the absence of secondary frames, the use of longer wheel bases, etc. In short, there are but few of the much heralded novelties of the Paris show that are not found on one or more of the cars on exhibition at Madison Square Garden. Steel cylinders are almost the only exception, while on the other had there are a number of features here that are certain to be copied and find their way into accepted practice.

Chief among the features which distinguish the most advanced American practice from that of European builders are the greater flexibility of governing the greater accessibility of motor control, and the greater interchangeability of parts of the former.

Until recently foreign gasolene cars have been hand governed, either by the spark lead or the use of the throttle. The Panhard people first made use of an automatic governor, and were followed by Mors and other makers. At the present time the use of governors is general, abroad as well as here. But American builders make a much more extensive use of hand appliances, either to retard or accellerate speed, changing the action of the governors or suspending their operation entirely. Hence, they have a better command of the engine without having to resort to such frequent use of the speed changing gears. At the show under notice, conspicuous examples of this tendency are the Packard, the Berg, the Locomobile, Columbia, Pope-Robinson and Pan-American cars.

LOCOMOBILE LIMOUSINE.

In accessibility of engine parts the Columbia touring car is the striking example, its detachable valves and plugs being unique.

Digitized by Google

But several other concerns have given the matter thought, and the result is seen on a number of stands.

Interchangeability is the great characteristic of American machine practice. Consequently, its influence is seen at Madison Square Garden. If an American maker makes a split or three part shaft he designs it so that either end will be the left hand one; that is, both ends are alike. The same distinction to make two or more different pieces where one will do for all, is seen. This simplifies replacements, of course.

UNITED STATES LONG DISTANCE CAR.

The high speed engine still exists, but it is the low speed one that is found on a vast majority of the stands. It is probable that 600 revolutions per minute is rather above than below the average. In the case of the Winton, for example, the mean speed is less than 400 revolutions.

Owing, perhaps, to the number of powerful and speedy cars shown, the sliding gear type of transmission is seen to have gained ground at the expense of the individual clutch. It is not always accompanied with chain drive to the rear wheels. In several instances, the new Packard being a notable example, shaft and bevel gears to a live rear axle take the place of chains. This, of course, raises the old controversy of chain versus bevel gear drive, and it is just as impossible of settlement as it ever was.

The sun and planet type of gearing, being confined chiefly to the light and medium weight cars, has quite held its own. Its comparative simplicity and suitability for cars not requiring a large number of speeds insures such a result.

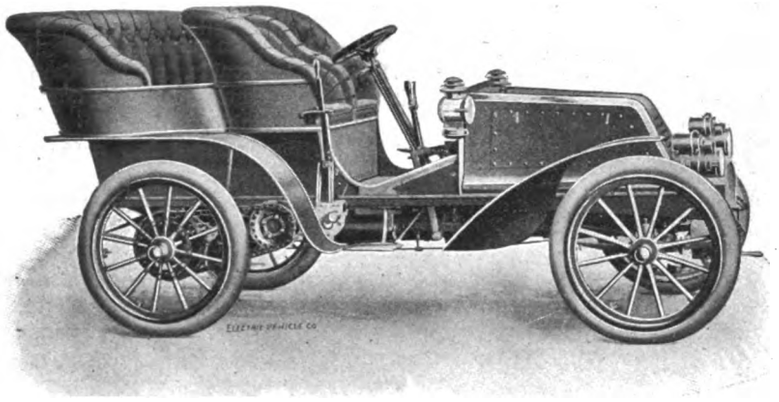
Reaches and tubular frames have undergone a great dimunition. The steel channel or I rectangular frame, sometimes reinforced with wood, is very popular. It is frequently narrowed at the forward end, so as to permit the front wheels to turn at a sharper angle.

Unrest and even uncertainty seems to prevail in the matter of ignition systems. Dry batteries, accumulators, magnetos, dynamos —all are in evidence—and none of them appear to be losing ground. Gains made in some quarters have been offset by losses met with in others. A maker who formerly used a magneto or a dynamo is found to have returned to batteries; while another exactly reverses this procedure.

The runabouts and medium weight vehicles undergo little change in price. But the big ones more than even matters up, for they have been placed high. The $7,500 Packard, the $6,000 Locomobile and the $5,000 Columbia cars are striking examples of this tendency. With them weights have also risen. The big cars run from 2,000 to 3,000 pounds, with the moderate priced cars 1,000 less and the runabouts going down to 500. It is noticeable, too, that the tendency is to get the centre of gravity down low, so as to insure stability.

The artillery wheel has made immense strides; other types are merely "scattering." The roller bearing, too, has gained ground. The detachable tire has the field pretty much to itself, the single tube variety having taken a seat very far back. Equal sized wheels and large tires are almost universal. The tonneau body is extremely popular. It marks the touring car, which is really the feature of the show. Makers may disagree about motor positions and types, but they are as one when it comes to the matter of touring cars. All admit the demand for them, and the addition of a little power and the substitution of a tonneau for a two-seated body is frequently all that is necessary to effect the change from runabout or phaeton to touring car. If touring is not pursued with avidity this year it will be cause for surprise.

Three cars of one general type—long based, bonneted, with wheel steering, artillery wheels, etc. And the bodies are usually comfortable and roomy, sometimes triumphs of luxuriousness.

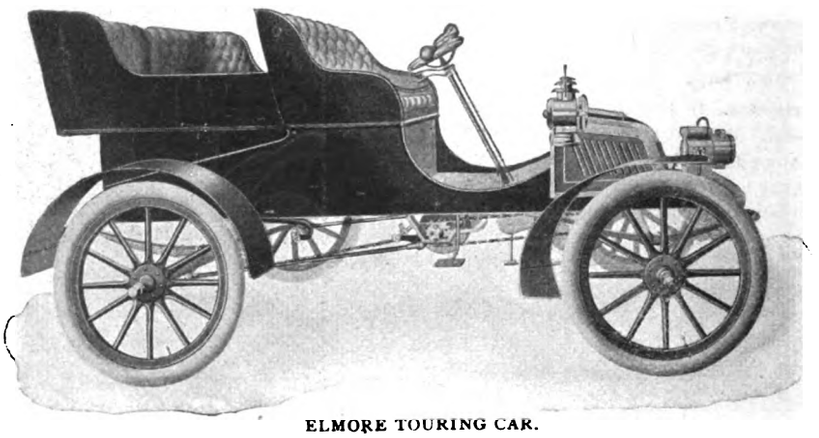


OLDS COUPE.

In covered gasolene cars the collection is really an impressive one. The Olds physician's car, the Locomobile limousine and

Digitized by Google

the Berg closed tonneau were all unheralded and genuinely novel. The cars with glass fronts and canopy tops—the Pope-Robinson, the Locomobile, the Long Distance, etc.—also show an appreciation of the demand for all weather cars. All these are of home manu-

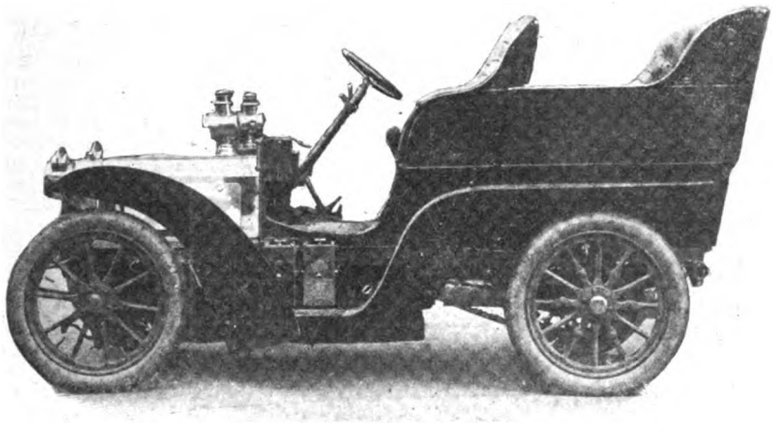


COLUMBIA TOURING CAR.

facture, the foreign cars—De Dion, Darracq, Central Automobile Co., etc.—bringing the total of closed gasolene cars up to 15.

Electric Vehicle Co., Hartford—While the Columbia electric vehicles obtained well merited attention, the gasolene touring car shown for the first time is an important contribution and development. This car exemplifies what long continued and careful study of the engineer, Mr. Fred A. Law, and the unlimited resources of the company, can do toward producing for the American market a machine ready to compete both in appearance and general usefulness with the high grade foreign built machines. It is in truth, a "car," and while conforming in general appearance and design to the style of the foreign cars, it has many features of improvement exclusively its own that well deserve the attention of those who are prone to rush abroad for their ideas.

From an æsthetic point, it is a handsome creation. It is long on its wheel base, which is 93 inches, with a 56-inch tread, and is provided with a "King of Belgium body" made in two pieces, the tonneau section being readily removable upon loosening four bolts. The wheels are all 34 inches in diameter with 4-inch detachable tires, and are connected to the body on the front axle through half elliptical springs, while full elliptical springs are arranged over the rear axle. These latter are pivoted to the body instead of being secured through a rigid spring clip, and thus give extraordinary ease of action. The engine is of an approved form specially designed, having four cylinders 5 inches in diameter with a 5-inch stroke, giving a rated horsepower of 20 and a 26 brake horsepower. This engine is mounted, or rather suspended, from an angle iron frame thoroughly trussed in such a manner that all lines of strain upon the frame during its flexing action are about the axis of the main engine shaft. Its igniting plugs and valves may be removed by merely turning the key or lever a quarter turn, and in each instance these parts are bodily removable, and may be opened at will and in the shortest possible space of time without even the use of a wrench. The engine is, of course, water cooled, and a cooler of the honeycomb type with a fan driven by the main engine shaft provides ample cooling means for the water, which is under forced circulation induced by a positive gear driven pump. No water tank other than the honeycomb cooler is used. A very novel ignition system is to be seen on this vehicle, and is known as the Eisermann. While this system is comparatively new, and it is believed appears upon this vehicle as the only example in the show, great things are claimed for it. The whole mechanism, including the contact devices for igniting the compressed charges in the several cylinders, is contained in a single structure, and requires the use of but a single spark coil for the four cylinders without necessitating the use of a battery. A battery is provided, however, with a switch conveniently located upon the seat by which the engine may be started by simply throwing a switch and without necessitating the use of a crank. The gauge in the dash shows at an instant's glance whether or not the water about the engine cylinders and heads is circulating properly. A gasolene tank with a capacity for 150 miles is located under the front seat, and all necessary water for a 150-mile run is stored in the cooler. The engine has an automatic throttle governor of the ball type, the governor being arranged at the extreme front of the engine, and this governor will absolutely govern the engine to 500 revolutions a minute. The engine drives through a sliding gear system of transmission, with a direct drive upon the high gear to a countershaft, with individual chain drive to each of the rear wheels. This transmission, giving four speeds forward and one reverse, with a maximum speed of forty-five miles an hour, is controlled by a single lever which passes through a slotted plate, the latter being provided with a lock for preventing unintentional throwing of the lever into the reverse position. A unique feature in connection with the carburetter is an automatically adjusted mixing valve, comprising a counterbalance vein opening directly from the atmosphere, while the main supply of air is taken from a tube located adjacent to the heat engine surfaces. This latter tube has an auxiliary sleeve with perforations, the registering position of which may be varied with relation to the main tube, thus tempering the air passed to the carburetter to any desired degree. The oiling system for the engine is admirable in every detail; strainers are interposed both in the oil circuit and the water circuit, with readily removable traps, which upon being withdrawn take with them any dirt or sediment which may have inadvertently found its way either into the oil or water system. The splash system of lubrication is used in connection with a direct feed, and the engine shaft has upon it rings or plates which, through centrifugal action, co-operate with gutters or drains arranged to catch the drip from the main portion of the cylinder, and insure proper lubrication of the parts, at the same time preventing the passage of oil out through the main bearings. The oil for the main oil system is fed to the engine under pressure, which pressure is induced by a shunt tube connected with the muffler. In addition to the automatic adjusted mixture, there is the hand justifier, the lever for which is mounted upon the steering wheel support, together with a lever for adjusting the ignition and accelerator for varying the action of the throttle governor. Wheel steering is used, with a particularly fine arrangement of tilting steering wheel and inclosed rack and skew gears, the latter inclosed in a single casing and immersed in oil. The main clutch, which is of the flywheel pattern, merits particular attention. The movable member of this clutch has in its outer surface a series of spring pressed blocks, which normally extend above the surface of the clutch member and are the first to come in contact with the rather fast flywheel. This clutch is certainly unique, and by its construction it is claimed to be possible to throw it in without a particle of shock being trasmitted to the vehicle. On the other hand, by easing the clutch off it may be slipped without danger of burning parts. Two sets of very powerful brakes



ELMORE TOURING CAR.

are provided, one set upon drums arranged upon the rear wheel sprockets and the other arranged upon drums adjacent to the sprockets of the countershaft. The clutch pedal is interconnected with the regular brakes of the countershaft, so as to insure a release of the clutch upon an operation of the brakes. The emergency brakes are controlled by a lever, which automatically locks as it is pushed forward and is arranged just at one side of the steering post.

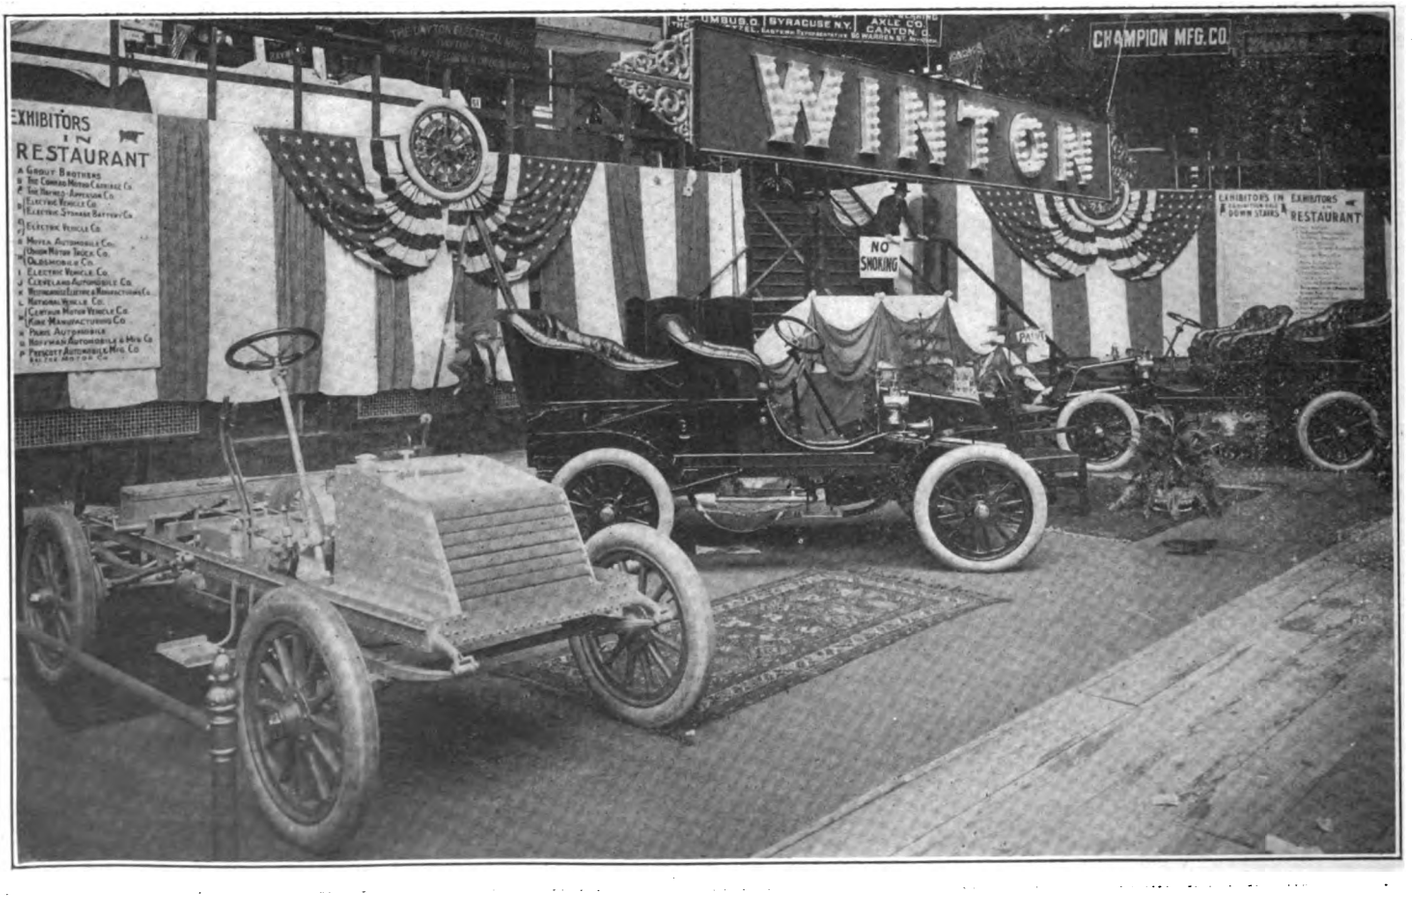
Locomobile Co., of America, Bridgeport, Conn., heretofore apostles of steam, make a display of gasolene cars so formidable and so extensive as to demonstrate effectively that their venture into the new field is neither equivocal nor half hearted. They showed four striking models, a 26 horsepower touring car with King of Belgium

MOYEA TOURING CAR.

body, a Limousine (the first American car of the sort), and a touring car with canopy top and glass front. The chassis is made in two styles, equipped with either two or four cylinder motors of improved construction. In both motors the centre section of the engine casing is the one which is supported from the iron shaft frame, thus permitting the dropping of the lower section to give access to the crank chamber, and, if necessary, the removal of the upper or cylinder section. All valves are made most accessible. The exhaust and inlet valves are removable through the same opening, and are held in place by a very simple arrangement of yoke and single bolt. A ball governor operates directly upon the throttle, which is of unique pattern, consisting of two concentric members, one of which is movable by the ball governor, while the other is rotatable with relation to this, and is controlled by a hand lever upon the steering position. The jump spark is used in the igniter system, with both gear driven generators and storage batteries. Two batteries are used in conjunction with the generator, and a novel arrangement of automatic switch controls the charging of the batteries from the generator when its potential has reached a predetermined height; thus the batteries are always fully charged, and may be used, or used only for starting, and for running the machine until the generator has attained a predetermined speed. The instant of ignition is controlled simultaneously with the variation in position of the throttle by the throttle governor. In addition to this automatic igniter governor there is a hand adjustment through a lever on the dash. The sliding gear type of transmission is of very compact form, and gives three speeds forward and one reverse, with a direct drive from the engine to the countershaft on the high gear. All changes of speed in the change gear are secured by the movement of a single lever. The regular brake is pedal operated, and acts directly upon the countershaft, while the emergency brake acts upon the drums of the sprockets of the rear wheels. The latter are lever operated. An irreversible steering mechanism of the worm and segmental type is used. The wheel base is 84 inches with 51-inch tread. Forced circulation is used, induced by a centrifugal pump, which is gear driven. The water tank is carried on the front of the dash just under the bonnet. The lubricating tanks are secured to the water tanks and project along the side of the cylinders. A unique feature in the lubricating system is an interconnection between the main valves and the igniter switch, which insures turning the oil on and off as the igniter switch is thrown either into operative position or cut off position. Oil is fed directly to the crank cases, and the splash system of lubrication is used entirely. Another novel feature is an air mixing valve located back of the carburetter and adjustable for any variations of hot and cool air. Thus air of any desired temperature may be admitted to the carburetter. A novel form of cone clutch is used, obviating all end thrust. It is leather faced and mounted upon a long sleeve, and has its spring members arranged exteriorly and on opposite sides of the sleeve. Any desired type of body may be used on the complete chassis.

Pan-American Motor Co., Mamaroneck, N. Y., who exhibit for the first time, show two attractive cars and a standard chassis,



MATHESON TOURING CAR.

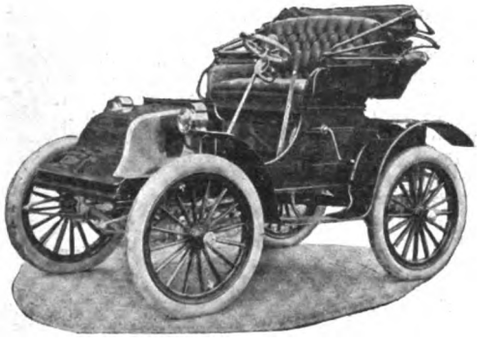
which was built under the supervision of Mr. James E. Woodbridge after the design of Mr. William M. Power, the well known gasolene engineer, to display the well arranged disposition of the mechanical parts. Both vehicles are of the tonneau type, and have, respectively, 84 and 96 inch wheel bases. Four cylinder motors are used, with a sliding gear transmission drive from a countershaft to the rear wheels. The engine has some novel features, particularly in the arrangement of exhaust and inlet valves, which are formed concentric and both removable by simply loosening a retaining nut. The inlet valve is arranged to cover the stem of the exhaust valve, the stem of which is hollow, thus giving an unusually large exhaust valve with all the benefits of the incoming charge as a cooling medium. The engine is normally governed by a centrifugal governor controlling a throttle valve arranged adjacent to the carburetter, which is of the float feed type. This throttle valve is also controlled by a foot pedal, which acts as an accelerator. In addition, another throttle, governed by the handle lever on the steering column, may be used to cut the motor out entirely if desired. A unique lubricating system is employed, in which the main oil tank, which is carried adjacent to the cylinders of the engine, has its oil forced into the sight feed lubricator on the dashboard by water pressure induced by the circulating pump of the cooling system. All parts of the contact device for the ignition circuit are inclosed in this arrangement upon the outer end of the cam shaft and may be readily removed. The ignition is controlled by a hand lever arranged upon the steering column. Two brakes are provided, one pedal operated and acting upon the differential, while the second is lever operated and acts directly upon the sprocket drums of the rear wheels. The sliding gear transmission gives three speeds forward and one reverse, all of which are controlled by a single lever. On high speed, drive is direct from the engine to the countershaft, with no intermediate gears. The reverse lever pulls up just in front of the heelboard. The crank cases are spherical in form, and by using pickups on the crank the splash system of lubrication is used, dispensing entirely with an oil feed to the cylinder. All parts are thoroughly encased, even to the cam shaft and operating cams. To provide for the necessary flexibility between the engine and transmission gears a universal coupling is provided just in rear of the movable clutch member. The clutch interlocks with the brake, necessitating a withdrawal of the clutch upon application of the brake. The frame of the chassis is set very low, giving a rakish body and low centre of gravity. From an æsthetic standpoint, the design and appointments are elegant and received well merited attention.

Packard Motor Car Co., Warren, Ohio, exhibit, in addition to their regular tonneau

Digitized by Google

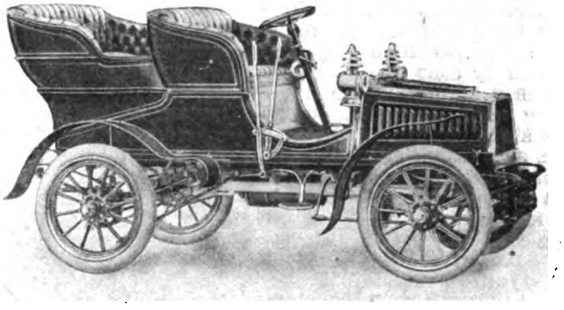
Digitized by Google

machine, a car showing radical departures from their well known product. It is, strictly speaking, a machine built on the Mors plan, having a complete chassis with removable tonneau and detachable front body portion. A four cylinder vertical engine, giving 25 horsepower, with novel governing system, is used. This engine is arranged at the extreme front of the machine, and is ordinarily controlled by a ball governor, which controls the lift of the inlet valves and simultaneously advances or retards the ignition. A lever traversing a segment arranged concentric with the steering wheel is connected with the governor, and may be used to neutralize its effect. This lever may be used to accelerate the speed of the engine beyond the governor limit, or may be used to retard it. It, of course, simultaneously varies both the instant of ignition and the opening of the inlet valves. The Packard sliding gear transmission is used, and an interlock is provided between the change gear lever and the clutch pedal, necessitating the throwing of the clutch before changing the gear. The regular brake is arranged directly upon a drum carried on the main driving shaft at the rear of the change gear box, and this shaft is provided with a universal coupling and drives through bevel gear to the differential upon the rear axle. All parts are thoroughly incased, and, as far as possible, run in oil. The oil is fed to the engine cylinders and main bearings under pressure induced by a pump arranged in the case of the oiler and driven from the cam shaft. The regular Packard carburetter is provided, with a single float feed chamber and two carburetter chambers, each one arranged to take care of two cylinders. A forced circulation of water is used for cooling, and is secured by a positively driven gear pump. The water tank is located at the extreme rear and the gasolene tank under the front seats. A novel arrangement of space or distance bars is used upon the rear axle, and lies just under the half elliptic springs, and is connected at its forward ends with the spring shackles. The wheel base is unusually long—94 inches. Thirty-six-inch wheels are used, with 4-inch detachable tires. In addition to the engine oiler a hard grease oiler is arranged upon the dash, with feed tubes connecting with the bearings of the transmission system. The ignitor circuit may be cut off by depressing a push button arranged in the frame of the steering wheel, and in addition a two way switch, with bodily removable handle, controls the circuit from either of two batteries. A gauge on the dash shows at a glance whether or not the water is circulating properly.



This car embodies the finest features of mechanical construction, and its details are particularly well worked out. It is fair to presume that the new model will become, if possible, even more popular than the excellent machine heretofore so successfully marketed.

The Berg Automobile Co., New York, exhibitors for the first time in this year's show, display four very handsome models of gasolene vehicles, one of them a closed car, the inclosing portion being removable. They conform closely to the general type of foreign machines, and are provided with the tonneau, charrette, and tonneau with detachable top bodies. Two styles of chassis, varying very little except as to dimensions, length of wheel base and tread, are used with these various bodies, practically the only difference being in the power and motor equipments.



The tonneau, with and without top, each has a four cylinder engine, while the other tyue has but two cylinders. The chassis comprises a wooden frame, reinforced with steel side and corner plates, and the forward axle is dropped and of a form to give it a trussed strength. Half elliptic springs are used forward with semi-elliptic at the rear. The cooling coil has a novel feature, inasmuch as the side plates, which close in the sides of the tube headers, are removable and any of the tubes may be cleaned at will.

The water tank is located just under the body and forward of the rear axle. A centrifugal pump, driven from the flywheel, produces forced circulation. The lubricating system for the engine is a direct feed, and a novel arrangement of piston driven pump is used for forcing the oil into all parts of the mechanism. This pump is inclosed within the oiler casing, and is driven by a belt drive. A rather unique style carburetter is used, which might be styled a compensating carburetter. It comprises the ordinary float feed chamber, having at the outlet a valve automatically controlled by a ball governor arranged forward of the engine and adapted to throttle the engine to predetermine speeds. Upon the steering pillar there is a lever, connected with this valve mechanism, by which its position may be varied to throttle the engine to any desirable degree independent of the action of the governor. A pedal is also provided at the right of the steering pillar, which permits throwing this valve wide open for the purpose of quick acceleration. In the throttling action of the carburetter valves the supply of air is also automatically varied, thus changing the mixture to correspond to variations in position of the throttle valve. A sliding gear type of transmission is used, controlled by a single lever, giving four speeds forward and one reverse. The secondary ignition system which is used is controlled by hand through a lever arranged upon the steering pillar. The contacting device used in the ignition system is novel, and comprises an insulating ring with contacts arranged upon its inner surface. The co-operating contact member is carried upon a cam shaft, and comprises a weighted spring member, which is dragged over the contacts of the ring member. The purpose of this weighted spring is to increase the tension between the contact members as the speed of the engine increases. As the spring not only has its own force, but the centrifugal action of the weighted member, it produced a firm rubbing contact. The steering gear, instead of using the worm and segment or rack, has arranaged within an oil tight casing a nut which traverses the screw threaded end of the steering post; this has upon its outer surface a rack meshing with a pinion, fast upon a short shaft, which bears at its end the steering arm affording direct connection with the individual pivoted wheels. An interlock is provided between the regular brake and clutch and the emergency brake and clutch. This necessitates releaesing the clutch upon application of the brake.

The regular brake is controlled by a pedal and acts upon the cam shaft, while the emergency brake acts directly upon drums upon the rear wheels. In the two cylinder machine a direct bevel gear drive is used between the change gear mechanism and the compensating gear of the rear axle. In the four cylinder machine individual wheel drive is secured from a counter shaft through sprocket and chain drive. Altogether the Berg is of simple and admirable construction, and has omitted many of the automatic devices which are liable to give more or less trouble. All valves are accessible, and ample provision is made for inclosing the several parts of the mechanism. The four cylinder car carries a supply of gasolene for 200 miles, while the small one has a tank capacity of 150 miles. The maximum speed of the heavy machine is forty-five miles an hour, while the lighted one is designed for speed up to thirty-five miles an hour.

HAYNES-APPERSON OF 1903.

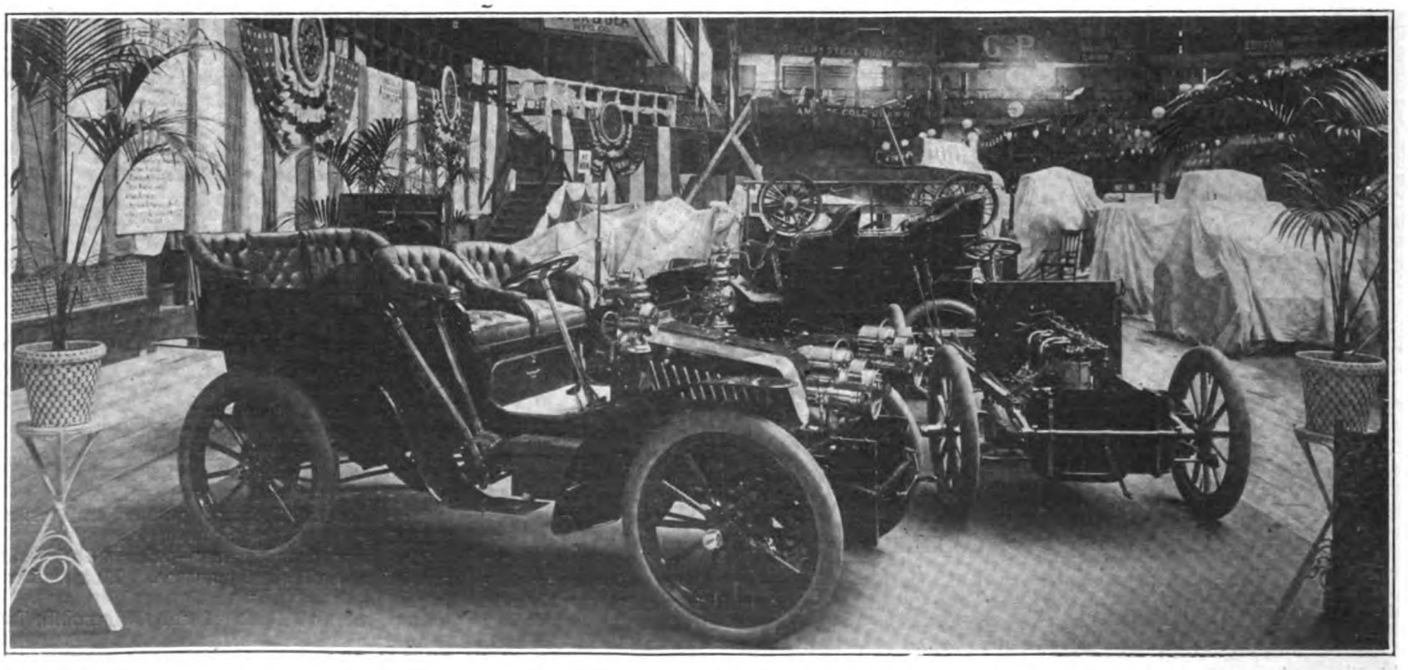
TOLEDO TOURING CAR.

The Olds Motor Works, Detroit, Mich., show, of course, the famous Oldsmobile runabout, the one that set the fashion to the world and the success of which induced a host of others to embark in the manufacture of runabouts. But it was not the runabout that caused knowing visitors to blink, nor even the tonneau car, of which there had been hints and which was exhibited for the first time—it was the presence of an Olds coupe, of which no intimation had escaped; none had reason to even imagine that the Olds people had a closed car in prospect, and its unexpected appearance was probably the biggest surprise of the show. It is a handsome little creation with rounded front and two seats, and is operated from the inside; it is of 5 horse power and priced $1,100.

The new touring car—price $1,250—also marks a radical departure. The tonneau has side entrances on both sides, and the original curved dash of the Oldsmobile has been retained behind the bonnet. The motor is of the two-cylinder, opposed type, and of

Digitized by Google

eight horse power. The remainder of the chassis is of the Oldsmobile side spring construction. The new Oldsmobile carburetter is used, the transmission gears running in oil although only one controlling lever is used, making the car easy to handle, a wheel or centre lever for steering being furnished as options.

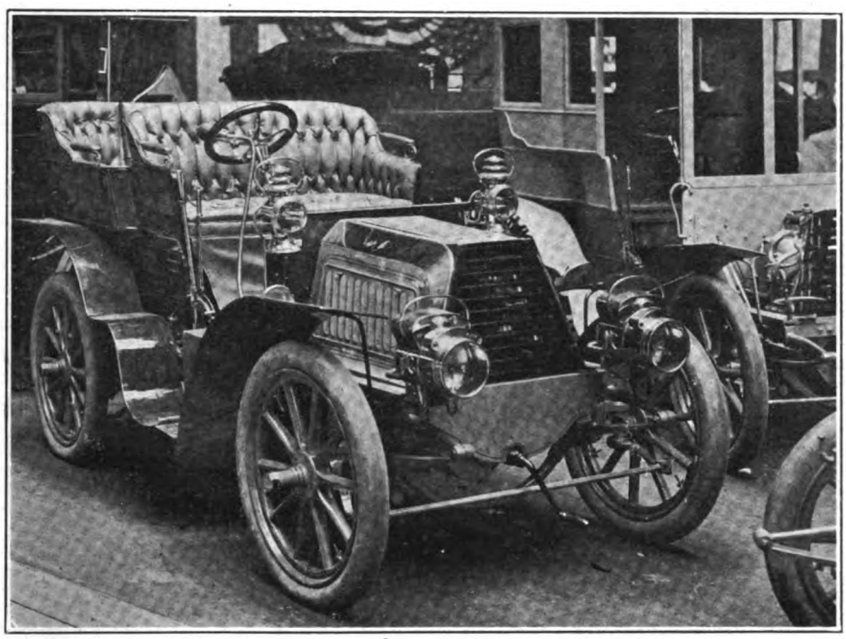


In the single cylinder runabouts of the reachless type, with side springs, few changes have been found necessary in its construction, the main ones being truss front and rear axles and improved carbureter, eliminating the use of the gasolene pump and having only one connection with the tank, and giving greater power with the mixture. They still use mechanically operated valves for both the inlet and the exhaust, both being operated on the one shaft, so that the timing is bound to be accurate. While the appearance at the Paris show of mechanical valves started the world talking about them, the Olds is evidence that they did not originate abroad.

The new Moyea Automobile Co., New York, have done themseleves proud in their touring car, one of which is exhibited. It is an impressive creation. It weighs approximately about 1,900 pounds. Wood lined steel frames, with steel hangers, live rear wheels and solid forged front and rear axles are used, the engine and gear case being fastened on a false steel angle frame. The motor is of a four cylinder upright type, 4-inch bare by 5½-inch stroke, of 16 horsepower, which is transmitted by cone friction clutch at 1,200 revolutions a minute. Slide transmission gears are used, first and second speed and reverse six pitch; third and fourth speed, eight pitch, on a train balladeur style. The atomizer is of a special type of constant level float, which is never regulated, the air only being regulated by variable ignition and independent from each other. The atomizer regulates the speed of the engines. Cylinders are cooled by water and fan driven by the motor, which has a water jacketed intake, exhaust valves and cylinders; a centrifugal pump is used, but without radiating coils, but has a water tank, which is at the same time a water cooler, is at the front of the car, and consists of a nest of banked tubes, which give a very thin water surface with a maximum of air cooling surface. The ignition is by a high tension current. The gasolene is fed by gravity, and carries fifteen gallons. Two outside band brakes are furnished and one inside on differential. All the brakes are double acting, and when applied release the driving clutch. A spark advancer and accelerator are attached to the steering pillar under the steering wheel. The upholstering is of genuine pigskin, and is luxurious to the highest degree.

The Pope-Robinson Co., of Hyde Park, Mass., exhibit three unusually fine cars, employing the well designed four cylinder motor formerly used, but which has been improved in several details. In place of the air cooled head, a water cooled head and cylinder are now used. The motor is governed by a ball type of governor acting directly upon a throttle valve. The governor may be thrown out of operation or varied at will; a single Longumare carburetter is used for the four cylinders, in place of the four carburetters formerly used. The change gear mechanism is of distinctive design. Both the gears on the main shaft and countershaft are in mesh, and either train of gears giving three speeds forward and one reverse may be selected and used by bringing into engagement its corresponding metallic clutch member. On the high speed all gears are idle, and a direct drive is secured between the engine shaft and the counter shaft. The ignition system, as heretofore, is a touch contact spark, and by mounting the lower end of the contact rod in a pivoted yoke the instant of ignition may be changed at will by varying the position of the yoke relatively to the operating cam. This does not in any way affect the speed of the engine unless the accelerator is in use with the governor cut out. All vehicles of this company are made on a standard chassis, having a channel iron frame, which was adopted by them more than three years ago, and which is now almost universally used by the best makers of gasolene cars, in place of a reinforced wood frame. On the whole, the car has many features to commend it. Its control is easy and elastic, free from shocks, due to its peculiar change speed mechanism, which is practically noiseless.

Conrad Motor Carriage Co., Buffalo, N. Y., show a new type of runabout costing $750, with a full square bonnet and a folding or disappearing seat in the rear, and which embodies an entirely new and fetching practice for this class of vehicles. It is fitted with double cylinder upright engine of the De Dion type in front, connected for driving by sliding gear transmission, which in turn is connected with the rear axle by sprocket chain. The size of the engine is 3½x3½, and at 950 revolutions develops 8 horsepower. It is fed with new water cooling attachment, consisting of a top and bottom tank separated by a rotating coil, which is placed squarely in front of the machine and above the axle, and is covered by a Mercedes type of head. The frame of the machine is of bent angle iron with full elliptical springs. It has wheel steering gear, with all throttling and controlling levers on the steering pillar at the finger's end. The foot brake disengages the clutch before the brake is applied. To all appearances this car is a simple runabout, but the rear apron opens upward, disclosing a seat which enables the car to carry four passengers. This is a very taking feature of the show, and is attracting much attention. The tonneau car has a double cylinder, 12 horsepower, upright, vertical motor 4½x4½, developing 12 horsepower at 900 revolutions. The drive is by means of the sliding gear transmission type, three speeds forward and one reverse; fitted with 30-inch wood wheels and 3½-inch double tube detachable tires. It is claimed that this car embraces all the best features of the high priced machines, its price being only $1,250. The tonneau is detachable, and a wooden apron is provided to replace the tonneau for speeding purposes.



Matheson Motor Car Co., Limited, Grand Rapids, Mich., exhibit for the first time at this year's show an attractive car of the four-cylinder type, which is as nearly as possible an American Mercedes car in frame, running gear, transmission motor, and cooling system. One distinguishing feature and one different from the Mercedes costruction is a direct drive through bevel gears to a divided rear axle having universal joints each

PACKARD DISPLAY.

Digitized by Google

side of the differential, to give the required dish to the driving wheels. A ball race is formed just back of the teeth on the bevel gears to take up all thrust. The engine is controlled as to speed entirely by the throttling system, manipulated by hand lever on the top of the steering wheel. The ignition is also hand adjusted for various speeds and from the same place. One of the new features of the engine is the intersected thread on the igniter plug, which permits removal of the plug upon a third turn of the plug. Both the exhaust and inlet valves, which are mechanically operated, are removable on the intersected thread principle. The valve seats are taken out with the valves and may be replaced in a very few moments. The cylinders are turned, both within and without, to a uniform thickness of metal, and the water jacket is shrunk on to the outside, which insures a light cylinder and

BERG TOURING CAR.

one which will maintain perfect form even under excessive heats. A driving shaft for the back wheels runs inside a sleeve which carries the back wheels on ball bearings. The wheel base is unusually long, being of 95 inches and standard tread. Great ease of riding is claimed with contemplated springs, which are a combination leaf and coil spring. Alternating magneto is used starting on the first half revolution of the starting crank. Machines are equipped with 25 H. P. motors and started by air pressure from the seat. This same air pressure forces the gasolene into the carburetter and does away with the shunt muffler used by the Mercedes.

International Motor Car Co., Toledo, Ohio—The 24 horsepower Toledo touring car, employing an improved motor of the four-cylinder upright type, has as novel features copper water jackets for the cylinders and bodily removable heads, in which are arranged the inlet and exhaust valves. Both these valves may be readily removed by pulling out a locking pin and turning back a hinged yoke. A centrifugal governor acts upon the throttle valves, of which there are two, one for each pair of cylinders. A link connection is also formed between the throttle valves and a foot pedal, by which the operation of the governor may be modified and the speed of the motor accelerated. The instant of ignition is controlled by the hand lever arranged concentric with the steering pillar and having its operating rod carried through it. The carburetter is of the float feed type, and has the usual adjustments for varying the mixture. An Apple igniter belt driven from the flywheel is used. Splash feed is used in the crank case, with mechanical feed for the lubricating oil of the cylinders. In addition there is provided a grease cup, which furnishes the necessary lubrication for the change gear mechanism, the gears of which always run in oil. A unique housing is provided for the igniter coils and oilers, all of which are located in a tight box dash, to which the bonnet is hinged. In addition to the Apple generators there is also provided a battery. A three way switch is used for cutting out both the generator and battery or cutting in either of them. The brake pedal and clutch pedal are interconnected, necessitating the throwing of the clutch upon application of the regular brake, which acts upon a drum upon the countershaft. The change gear is of the sliding gear type, giving a direct drive of the engine to the countershaft on the high speed without intermediate gears. The several gear changes are made through single lever, which gives three speeds forward and reverse. A very novel and effective lock is provided for the change gear lever. This lever moves on a notched sector, and has a detent for positioning it for the various speeds. A handle for operating the detent is provided, with a pin which, in the forward speeds, engages a projection extending outwardly through the handle from a thumb operater push button. To secure the reverse position of the handle this button must be pushed down, and thereupon the pin of the detent handle passes over it and permits pulling the lever backward into the reverse position. It secures an absolute lock for preventing unintentional movement of the change gear lever from the go ahead to the reverse position. The cooling coil is of the honeycomb type, combined with the water tank and closing the forward end of the bonnet. In addition to the pedal operated brake there is a lever operated emergency brake acting upon the drums of the rear wheels. This lever is automatically locked in any position by the notch sector method. The tonneau body, which is of the King of Belgium type, is most luxuriously appointed and attracted more than ordinary attention. The upholstery is unusually deep and high backs are provided throughout. A special locking device is provided for the tonneau door, which absolutely insures it against accidental opening.

The Winton Motor Carriage Co., of Cleveland, Ohio, exhibit this year four vehicles—two of the tonneau type, one chassis, and the "Winton Bullet." The same general lines of construction used so successfully by the Winton company have been carefully adhered to, with many minor improvements and an increase in the power of the engine, which is now made 20 horsepower. It is horizontally disposed, and of the two-cylinder type. Where formerly some of the operating parts were mounted upon the body, they are now without exception carried upon the frame of a complete chassis. The steering wheel is now hinged to the steering pillar, and may be tilted forward or securely locked in operative position. The engine, as heretofore, is governed by the air pressure system, controlling and varying the opening of the inlet valve, and being controlled by a foot button or auxiliary hand operated valve. All parts of the mechanism are completely inclosed, and water, gasolene and oil tanks are arranged under the bonnet. Forced circulation is used with direct driven gear pump. One of the latest features on this year's machine is a modified contact device of the same general principle as heretofore used, but now arranged with a vibrating member having a cam surface acted upon directly by a cam on the end of the cam shaft. This contact member is carried in a box having a glass face and revoluble with relation to the cam shaft for adjusting the instant of ignition. The parts are thoroughly inclosed and yet visible at all times, and so arranged as to preclude possibility of the admission of all foreign substances. The regular Winton planetary gear system is used, controlled by two levers, giving two speeds forward and one reverse. One of these levers is connected with an emergency brake acting directly upon a drum upon the main shaft of the engine, and easily applied as the high speed gear is thrown out. The muffler is arranged to be opened directly to the atmosphere, where noise is not objectionable. The bronze connecting rods heretofore used have been discarded and drop forged steel rods, with bronze bushings, adopted. The batteries for the ignitor circuit are inclosed in a tight, galvanized iron box, lined, to prevent short circuiting, and are arranged in two sets, either of which may be thrown into use by a two-way switch arranged on the heelboard. The battery box is secured upon the frame at the extreme rear, and is accessible by raising a trap in the floor of the tonneau. The tonneau body is of the "King of Belgium" type, which is coming into almost universal use by automobile builders. The water pump is inclosed in a casting having a movable face plate, which casting forms the bottom of the crank case. A removal of the face plate gives easy access to the interior of the pump.

Peerless Motor Car Co., Cleveland, Ohio, whose cars are staged by the Banker Bros. Co., of New York and Pittsburg, exhibit a finely finished chassis mounted on four wooden pedestals about sixteen inches high. They also show complete cars, one of a big four cylinder 60 horse power, with vertical motor, of course, the Peerless having been one of the earliest to adopt that type. The frame is of channel steel with a drop

Digitized by Google

centre for the purpose of making the parts and mechanisms more accessible. Both front and rear wheels are pitched inward, after the manner of all vehicles not run on prepared tracks. The pitch of the rear wheels is made possible by a flexible axle. Last year's motor consisted of two separate cylinders, but in the new model the two cylinders are combined into one casting, making the motor a twin cylinder and doing away with the crank disks in the crank chamber, by using a one-piece crank with a single throw. Two hand-holes are placed in the bottom of the crank case for inspection or replacement of connectiong rod bushing. An automatic throttle governor on the intake is used which makes the motor very flexible. Ignition is by jump-spark, with their own patented mechanical vibrator. The water circulation is furnished by a centrifugal pump driven by gears. The lubrication is by force feed. The starting crank is stationary in front of the car, and is operated by a dog clutch instead of chain, the motor being started by a half turn of the crank. The drive is by means of a universal shift, and bevel gears mounted on ball bearings. The differential is also mounted on ball bearings, so that the end thrust of the bevel gear is provided for. The bevel pinion is mounted between two sets of ball bearings, which takes up the end thrust in the bevel pinion. Power is transmitted to speed gear by means of a cone clutch, which is engaged by means of a spring and disengaged by means of foot pedals or brake lever. The speed gear is connected to the driving gear by a universal shaft. On the high gear the motor is connected directly to the rear axle with no gears in use. It is assumed that as the car is used about 90 per cent. of the time on the high gear, this greatly lengthens the life of the gear. The change of speed motor is effected with an automatic locking device which prevents the shifting of gears unless the cone clutch is disengaged. A powerful brake on each rear wheel is operated by a lever at the right, which disengages the clutch and is held by a ratchet until released. A foot brake operates on the drum between the motor and the compensating gear, and also disengages the clutch. By means of a knuckle joint and sleeve the upper part of the steering column is broken, throwing the steering wheel away from the operator when taking or leaving the seat. All the wheels are ball bearing, and this fact is to be noted here, together with the fact that the shaft and bevel gear and differentials already mentioned are also mounted on ball bearings, which makes this one of the most advanced types in the show.

The Autocar Co., Ardmore, Pa., exhibited two complete Autocars and a chassis, one a tonneau, and a runabout with top.

The engine, as heretofore, is of the two cylinder, horizontal, double opposed type arranged transversely at the body and at the forward end under the bonnet. It is of 10 horsepower at 1,000 revolutions. The change gear mechanism is of a simple form of sliding gear with direct bevel and spur gear drive to the rear axle. A universal coupling is provided in the main line of shaft between the change gear and rear axle to provide the necessary flexibility; the trunnions of this coupling are hollow to provide for oiling. A water tank is arranged below the bonnet on the dash, and the lubricating oil is carried in a tank secured to the water tank. All parts are thoroughly encased, and splash lubrication is used wherever possible. A unique form of clutch is shown, comprising two co-acting clutch members embracing an inserted cork fin projecting from the inner face of the rear flywheel. The main flywheel is carried forward of the engine. This clutch is controlled by a lever arranged at the left hand side of the seat, and the handle of the lever has a rotary movement, which controls the throttle of the engine. In addition to this throttle control, the igniter controlling lever and the change gear lever are carried upon the steering stanchion. The change gear gives three speeds forward and one reverse, all controlled by single operating lever. Two brakes are provided, one a regular brake, foot operated and acting upon the drums of the rear wheels, the other an emergency brake, also pedal operated and acting upon the main pinion of the rear driving construction, a novel feature. The compensating gear upon the rear axle is of the spur type, and is driven by a pinion mounted in the same case with the main spur gear, and in turn is driven by a bevel gear drive from the main driving shaft. End thrust on the intermeshing bevel gears is taken up by ample ball bearings, which are adjustable. To prevent pounding and knocking of the springs when the vehicle is under a heavy load the two elliptical springs at the rear are each provided with an auxiliary bow spring, which comes into action and upon heavy jounces prevents the usual pounding. A direct chain driven centrifugal pump induces a forced circulation through an ample cooling coil, and as the water tank is located above both the engine and the cooling coil, the centrifugal pump permits a natural circulation when the machine is not in operation. A novel muffler, having twelve rectangular compartments, with the perforations between one compartment and another staggered with relation to each other, gives an exceedingly compact and practically noiseless muffler. All parts of the mechanism are accessible, simple in construction and of sufficient strength to secure great durability and at the same time give many features of interchangeability.

One unique feature of the Autocar exhibit was the placing of a mirror below the entire length of the chassis, thus showing every detail of the mechanism from below.

Thomas B. Jeffery Co., Kenosha, Wis.—Rambler cars.

A touring car at $750; single cylinder, 5x 6; 6 horsepower, weighing 1,200 pounds, with both valves mechanically operated by the same shaft; float feed carburetter with auxiliary inlet, which is automatic and flushed from the seat; planetary gears; one lever control, with thumb throttle control on steering bar; automatic governor for spark; drum brake on both rear wheels, which is auxiliary and regular on transmission; thermo-syphon system for water cooling; detachable gasolene tank with safety reservoir holding one gallon, which is shut off from the rest of the tank so that when the regular tank is exhausted a gallon of gasolene is always in reserve for twenty-five miles; fur full elliptic springs.

A decided improvement has been made in the design of the body; it is six inches longer, has removable air shutters in the sides, the shape of the bonnet has been altered, fenders have been added and a solid back high seat; the color of the body is auto red; an automatic grease cup displaces last year's gravity feed on the main shaft; centre steering with transverse lever. The governor and the two to one gears are covered, and the gears run in oil, so that the only slight trouble had with the governor in the New York-Boston reliability run is now obviated. Artillery wooden wheels of their own make, with 1¼-inch spokes, are used with single tube tires. The water reservoir is a large brass tank with about 380 feet of three-quarter-inch brass radiating tubes.

The Searchmont Automobile Co., of Philadelphia, Pa., exhibit two cars of attractive design and embodying features that are not to be denied. An armored frame, in the chassis is used, and is provided with a subframe of angle iron, upon which are mounted the motors and driving gear. Two cylinder motors are used, of improved pattern, having cylinders 4½ inches in diameter, 5-inch stroke and with ample provision for getting at the interior of the crank cases by simply removing side plates. The inlet valves are arranged on top of the extension projecting from the cylinder, and the exhaust valve is arranged immediately underneath, making both accessible and providing ample water space about the valves and cylinders. Forced circulation is used, induced by a direct driven geared pump. The motor is controlled by a ball governor, which acts upon the throttle and simultaneously varies the instant of the ignition. In the main rod connecting the governor with the throttle valve is interposed a spring cushion embracing the end of a lever, which permits varying the ignition by hand adjusted means independent of the action of the governor. A foot pedal is used for accelerating the speed of the engine by varying the working position of the governor or cutting it out of operation. A unique oiling system is provided for the engine, which comprises a main oil tank, having some ten piston pumps arranged within it and actuated by a sliding cam connected directly with the cam shaft. Each of these pumps is connected to one of the main bearings of the engine, the cylinder or the change gear mechanism through independent tubes, thus securing a forced feed of oil. A float feed carburetter is provided, with the usual adjustments for varying mixture, etc. The sliding gear type of transmission is used and controlled by a single lever, securing four speeds forward and one reverse. An interlock is provided between the clutch pedal and the emergency brake, assuring the throwing of the clutch upon the application of the brake. The regular brake is pedal operated, and acts upon the counter shaft, while the emergency brakes are lever operated and act upon the independently driven rear wheels. An Apple generator is used and a novel drive is provided for it. It is secured to the frame of the chassis at one side of the flywheel, and an intermediate spring pressed friction wheel transmits motion from the flywheel to the generator wheel. The struts for holding this driving member are adjustable, giving ample provision for taking up all wear. It is a most ingenious contrivaence. The water tank is located at the extreme rear and below the body, provision being made for filling this tank from the outside of the body.

A novel five seat arrangement is secured in the tonneau body by extending the door upholstery clear to the bottom and leaving it loose from the centre down. By simply raising the end of this upholstered portion the base of the seat drops down from the back, and is covered by the loose portion of the upholstery filling in the door space.

A novel form of emergency "cut out" and means for locking the vehicle cousist of a press button arranged in the frame of the steering wheel and co-acting with a removable plug, which breaks the igniter circuit and thus makes the vehicle inoperative.

Shelby Motor Car Co., Shelby, Ohio, exhibit two new cars, incorporating some new and original features. Two models are shown, one, having a single cylinder, being a single seated carriage with a combination drop seat; the other having a tonneau body with a double cylinder motor. The motor has an

Digitized by Google

open end cylinder fitted with two pistons. The two side connecting rods connect the back piston to the crank shaft with the centre of the crank shaft connecting the front piston to the same, the explosion, of course, then being placed between the two pistons, driving both pistons in opposite directions at the same time, but both pistons transmitting the power simultaneously to the one crank shaft, making a perfectly balanced motor. Great economy is claimed for this method of exploding the gases in about half the time that is taken in an ordinary single motor with the same amount of stroke. The pump operating from the flywheel of the motor cools it by circulation to the radiator in front of the car. Jump spark operated by batteries and magneto. Generators furnished when desired. Planetary transmission gear is used, giving three speeds forward and one reverse through one set of gears only, and direct transmission on the high speed. When the car stands still and the motor is in motion the gears are all idle. Wheel steering is employed, with a telescopic pillar rod, so that it can be adjusted to the height of the operator. The driving car is of the same general construction, having two sets of cylinders, with four pistons, and furnishing 20 horsepower. A reversible steering gear, which is interlocking, is used. It has a bell shaped worm, engaging the pinion of the steering rod, so that no shock on the road wheels is carried to the steering wheel, but the steering wheel readily controls the front wheels. All the supply tanks, such as water, oil and gasolene, are carried in front under the hood, so as to be very accessible, a gauge being on the dash showing the amount of oil, water or gasolene that is on hand at all times, also showing any leakage of the water supply, a special feature of this system being that should any leakage in the water supply occur the operator would instantly notice it on the gauge. The oil supply is placed immediately over the water tank, which leaves the oil hot and limpid. A carburetter of their own design, an invention of their Mr. Leppo, which throttles so as to give practically the same action as the throttle on a steam engine, enabling the operator when running in a crowded street with the high gear, the foot throttle controls it perfectly with the aid of this carburetter. It is a balanced carburetter, so constructed that the gasolene stands at a constant height irrespective of any tilting position the car may have; the needle valve is so adjusted that the supply of air and gasolene is controlled by the same operation at the same time. Regardless of the position of the throttle the percentage of the mixture is always the same.

Cadillac Automobile Co., Detroit, Mich., show one complete vehicle of the runabout type with a detachable tonneau and a complete chassis. An angle iron frame supported on half elliptic frames fore and aft and of unusual length supports, under the forward seat, a single cylinder horizontal motor of 7 3-10 horse power, which drives through transmission chain to the differential of a divided rear axle. The Cadillac car is entirely new and shown for the first time at this year's show. The low speed gear runs in an oil bath, and, in fact, the entire gear system is thoroughly inclosed. The main engine cylinder is smooth as to the exterior, and provided with a flange or cup which is provided with a water intake for the cooling system. A spun copper water jacket may be clamped to this flange and dispenses with the use of all gaskets, as the lower end of the copper shell is flanged and itself serves as the gasket. The inlet valve is mechanically operated and the main control of the engine is secured by a hand throttle combined with hand adjusted ignition of the jump spark type. A single hand lever gives the high speed forward and the reverse, which lever in the several positions may be used as an emergency brake. The low speed is secured by a foot pedal. A pedal operated band brake operating on the differential is also used. A unique form of sparking plug is shown in this engine, and consists of a main plate or support held in place by a yoke and set screw. This support bears two insulated sections, forming really a double plug, and angularly disposed, so that the inner ends lie adjacent to each other and thus a circuit plug is secured without necessitating the grounding of either side of the circuit. A carburetter of the needle valve type with an intake actuated baffle plate secures a positive feed of gasolene without the use of the ordinary float feed chamber. This is made easily adjustable, though it is claimed it requires little change in ordinary running. The car, which, as stated, is featureful and attractive, weighs with tonneau body about 1,200 pounds, and is unusually low priced, selling for less than $1 per pound.

George N. Pierce Co., Buffalo, N. Y., exhibit their well known Motorette, which has not been materially changed from last year's model, save that a 5 horsepower motor is now used. A new model, however, is shown, the Arrow touring car. It has a tonneau body mounted on a tubular steel underframe made of very heavy tubing, the whole of which is supported by four extra long semi-elliptic springs. The motor is a genuine De Dion, 15 horsepower, double cylinder, with a water tank placed in front of it; a ball bearing transmission gear, sliding type, is used, with a single cone clutch in the flywheel and bevel gear transmission on the rear axle and special ball thrust bearing and flexible shaft to gear box. The car when loaded weighs 1,650 pounds. Ball bearings are used on the front and rear wheels, which are of the artillery type. Two double acting hub brakes are furnished, as well as a transmission shaft brake, which is also double acting. The brakes are all interlocked with a friction clutch, so that when any of them are used the motor is disconnected. A motorette Stanhope model is also shown.

The Waltham Mfg. Co., Waltham, Mass., show their new medium weight Orient car, having a single cylinder motor rated at eight horse power, and of the high speed type, making from 1,200 to 1,500 revolutions. In addition to the carburetter they supply an air valve for regulating the motor for atmospheric changes without disturbing the adjustment of the carburetter. It is oper-

ated by a lever at the left of the seat. The transmission gear is on a direct shaft from the motor and operates on a band brake principle. They also have adopted the idea of driving direct from the motor at high speed without the operation of any intermediate gears. The controlling mechanism is one of the simplest in the show, and as a matter of fact the tendency throughout the show seems to be in the direction of simplicity in the controlling mechanism, a multiplicity of both hand and foot levers which require a great deal of ambidexterity, and foot looseness not being as popular now as it was a year ago, when we copied so freely from foreign ideas. The Orient controlling lever is located on the left hand side of the car. In the normal position the lever is not in action and the motor is free to run quietly while the car is at rest. To start the car the lever is pushed forward gently a few inches, which causes the slow speed gear to operate, starting the car slowly forward. A further movement of the lever forward will engage the direct gear and the car will then take the speed according to the pressure given by the foot on the foot throttle. To stop the car the foot is simply lifted from the throttle and the lever pulled quickly back as far as possible against the reverse, which acts as a powerful brake until the car stops, and then, if still held back, will cause the car to move slowly backward until the lever is allowed to take its naturally upright position. When the car is running backward a slight pressure of the lever forward will also act as a brake and stop it. The car is also provided with a powerful emergency brake acting upon the rear axle, but this it is seldom necessary to use except to lock the car fast when standing alone, the controlling lever being ample to handle the car under all ordinary circumstances. Of course, the driver during the various operations is expected to use judgment in pressing the throttle to give the motor the necessary power that may be required. A small spark lever is placed at the left of the seat, and when it is desired to leave the motor running free this is moved back, setting the spark back and slowing the motor to about 250 revolutions per minute, at which speed it will run for some time without attention. A lever operates an auxiliary air valve to regulate the mixture. A tubular running gear is used on this car, but having the constructive novelty of transverse elliptical springs front and rear. It is also peculiar in being the only car in the show having wire wheels with wood rims. The 350-pound Orient Buckboard, with a four horse power air cooled motor, cooled by a revolving fan fixed directly on the motor shaft, attracts a great deal of attention at this exhibit. The speed is controlled by the operator by pressure on the foot throttle and movements of the brake lever. For so simple a vehicle it has a rather long wheel base of eighty inches, and appears unusually low. The tread is but three to six inches, the wood work is finished in natural oak, and the wire wheels, like all the other Orient product, have wood rims. It has no change speed gears, nor can it be reversed. The well known Orient motor bicycle is also shown. Only a few minor changes in the details of construction have been made in it since last season, one of the main ones being an improvement in the belt tightening device.

The Crest Mfg. Co., Cambridge, Mass., show their Crestmobile, so radically changed as regards the position of the motor and the shape of the body as to be hardly recognizable. The new model "D" has the motor behind the front axle, hung on springs, with a bonnet front, quite a change from the old type with a piano box body and the motor exposed in front of the axle. The single cylinder, vertical motor, is still, however, air cooled, but with an increase to 5 horse power, and the wheel base of the carriage has been increased to six feet. The shaft drive, with two speeds and a reverse with a direct drive on the high speed without any other gears in motion has been adopted in place of the chain drive. Their original idea of a special lift on the exhaust valve from the seat has been retained, as has also their method of starting from the seat. Wire wheels have been discarded for the popular artillery wheels with detachable tires. Naturally enough, with all these improvements, the weight is increased to 750 pounds, and the car is sold for a dollar a

pound, indeed the cariage is now styled a light touring car. Another new model "F" is of the runabout style, with a bonnet front, having a 3½ horse power air cooled vertical motor, with a shaft drive for speeds forward and reverse. All the controllers in both these models are done from the seat, and all the mechanism is hung in a frame, so that the body is independent of the motor vibration.

The J. Stevens Arms and Tool Co., Chicopee Falls, Mass., show the Stevens-Duryea car, equipped with a two-cylinder horizontal opposed typ motor of seven horse power, employing an extremely simple valve, a single cam operating the valve of both cylinders. Very little water is required for cooling purposes, the circulation being maintained by a gear driven valveless pump. Four gallons of water only were carried during the trip from New York to Boston and return in the late reliability test, during the six days of continuous use, but one half, or two gallons of this water was used. The motor is started from the seat. The transmission gives three speeds forward and one reverse, all operated by one lever. The clutches are of the expansion shoe type. Lubrication is effected by use of an automatic oiler, it being only necessary to keep the oil tank full. The steering is a modification of the wheel-steering idea, but the Stevens-Duryea people believe that the use of an entire wheel is unneecssary, and therefore use a steering post surmounted by one spoke of the wheel only.

The Automotor Co., Springfield, Mass., exhibit their large touring car having a four-cylinder vertical motor under a square bonnet, with slight swell on top running to a square cooler in front in a diamond shape design, modelled somewhat on the Mercedes plan. A genuinely novel gear drive, which is direct on the high gear, has been adopted, but with the valuable addition of oiltight cases, so that the car can be driven 150 miles without oiling. The transmission gear is of a novel design, being a combination of the sliding and planetary styles, so that in ordinary running, that is to say at a medium speed, the change of speed is made without the use of sliding gears. The aluminum body is mounted on a channel iron frame resting on a full set of platform springs, such as are largely used in this city on business trucks. The full platform spring gear is one having two half-elliptical side springs and one half-elliptical rear spring, the springs all being connected together by the use of shackles and clips, differing from the half platform spring type, having body irons, which is so popular. The steering wheel instead of carrying gears on the end of the upright shaft, carries a separate gear in the steering wheel itself, which allows the placing of the steering post high up in the centre of the dash, leaving a clear floor space for the foot pedals and robes for the comfort of the operator. The steering rod at its base is fastened directly to the steering rod. The make and break commutator is on the dash in front of the operator, a method that is becoming very popular, with the reason too, as one can readily understand who has ever attempted to regulate a commutator under the body of the wagon among the heat, dirt and oil.

Hoffman Automobile & Mfg. Co., Cleveland, Ohio, show their "general utility" car, with its adjustable tonneau body. It has an 8 horsepower, single cylinder, horizontal motor, so constructed that the cylinder and cylinder head are cast in one piece, and the water chamber passes around the cylinder head, covering the valve mechanism and keeping both the cylinder and the valves cool. The valve mechanism is readily removed by taking away two nuts. The transmission gear is of the clash type, the speed being changed by means of a shifting gear which shifts from side to side. The slow speed is in the centre, and the high speed at one end of the case and the reverse speed at the other. The entire mechanism for all three speeds is operated by one clutch. When the operator desires to change the speed he shifts the clutch lever to the centre of the quadrant, which releases the clutch, the quadrant being fitted with a safety device which releases only when the main clutch is released. The speed case is mounted on a swinging shaft, which allows the mottom of the speed case to be moved forward or backward by means of a strut rod, which is fastened to the rear axle. Cooling water coils are placed in front of the body. Circulation pump of bronze is attached to the crank face and it is gear driven.

The Ward Leonard Co., New York, show what is probably the most composite car in the show, that is to say, it is composed of more French ideas of different makers arranged together than any other car displayed. On a large tonneau body, which is mounted on an armored wood frame, is used a copy of the Buchet four-cylinder vertical 24 horsepower motor, which is cooled by the water circulation system known as the Thermo-syphon system. The gasolene supply is, of course, modelled on the Buchet system, which consists essentially of an extremely large supply pipe without any sharp elbows, thus being the full size of the pipe to the inlet port and getting a feed from both drives, so that the middle cylinders do not get any less than the end cylinders. This supply pipe being run around in a circle continually, the exhaust valve and plugs are on top of the cylinders. The side feed lubricator is used to each bearing by force pressure from the exhaust. The Renault change gear is used, in which the gears are moved into mesh, face on instead of edgewise, which takes away all chances of chipping the edge of the gears and also obviates the noise of the gears as they slide into the mesh. A notable feature is the small size and light weight of the gear boxes, three speed and reverse being furnished. The bevel pinion can be readily removed in a few minutes for the inspection of the back axle and gears by merely removing the four bolts. The brake is on the Rochet-Schneider plan, which has four copper shoes on a band, and when the brake is reversed it is impossible for it to touch on the drum when not in use. The factor of strength in the rear axle is increased three times over the Renault, in order to adapt it to the more rugged American conditions. Steering is by the usual inclined wheel, with control of the admission and the advance of the brake on the Renault system. These and the throttle control are by three levers placed on the steering pillar. The speed gears are made by big side levers, and an additional lever is furnished for a brake. The cone clutch is operated by a foot pedal and another foot pedal brake, which also opens the clutch. Roller bearings are used not only in the wheels but in the speed boxes. The body is of the King of Belgium type, a most extreme design, having a very graceful front hood, the body itself being made of hammered aluminum. A German Magneto is used which is a novelty in this country and which has been recently adapted by the Daimler and Panhard Co. This Magneto gives a jump spark even when turned at the slowest possible speed by hand, and by its use it becomes possible to dispense with the battery for starting. The action of this Magneto is as follows: As the shaft is turned, developing an electro motive force, the armature is short circuited by the platinum contacts until the circuit rises to its maximum amount, then the platinum contacts are separated suddenly by the cam. The interruption of the current by the platinum contacts causes the current to discharge into the primary of the special induction coil, the secondary of which supplies the spark plug. This gives an electrical effect while turning the crank at slow speed, which is equivalent to a sudden strong mechanical impulse. The price of this car is $5,000. A 16 horsepower two-cylinder motor, with perfectly balanced cranks set at 180 degrees, is shown in a car tonneau body, having the Limousine top, which is removable and has a glass front. A special patented four-speed gear is used in which the direct drive is upon the third speed.

Kirk Mfg. Co., Toledo, Ohio, show the Yale touring car, with detachable tonneau, having a wide rear door, an item worth remarking. The motor is of the double cylinder opposed type of 10 horsepower. Planetary transmission is used, handled by one lever. A novelty is the method of steering. A wheel is used, and the steering bar carries on its post a plain compound gear which works on an L shaped crank. The adjustment of the various valves are such that there is nothing to turn on or off when starting or stopping, excepting the operating levers. A rotary force pump is used in connection with the radiating coil. A new carburetter is furnished, but of which they decline to furnish details at present owing to some patent complications. The entire mechanism, with the exception of the wheels and rear axle, is lubricated by the McCahna hydrostatis system, which is positively driven and stops and starts with the engine. An electric switch key is provided, so that the car can be securely locked during the operator's absence. At the price—$1,750—the Yale is splendid value.

United States Long Distance Automobile Co., Jersey City, N. J., exhibit six complete vehicles, a complete chassis and a Standard Marine engine, built after their special design. The chassis attracted more than unusual attention and was hung in such manner as to be operated by electric motor, showing the complete operation of the driving mechanism and also the special arrangement and operation of the several engine parts. The chassis is of the angle iron type, supported upon half elliptics, both at the rear and forward. The engine is of the double cylinder 12 horse power upright type, and is in the bonnet and hung on an inner angle iron frame just in advance of the water tank. A simple arrangement of yoke and single bolt provides for the easy removal of the inlet and exhaust valves, both of which are mechanically operated. An ingenious governor consists of a weight pivoted to the flywheel and thrown outward against the effect of a dash pot, automatically varying the position of the collar on the main shaft and through link connections controls a throttle valve of the butterfly type. The ignition is hand adjusted. The governor also has a hand adjusted means for varying its operation and accelerating speed of the motor. Forced circulation is used with the centrifugal pump driven directly from the main shaft. The change gear mechanism is of the planetary type, giving three speeds forward and a reverse and controlled by a single lever and a foot pedal, the latter giving the reverse. On the high speed the drive is direct from the engine to the differential arranged upon a divided rear axle. An equalizing rod of unique construction is arranged between the case of the balance gear just overlying the main driving shaft and connected to a cross member of the frame near the change gear mechanism through double pivot connection. This construction provides a warpable frame which will flex only about the axis of the main driving shaft. A pedal operated regular brake of the expanding type operates upon the inside of the rear wheel drums, while the emergency brakes grip the outside of the same drum and are lever controlled. A very pretty equalizer for the pedal operated brake of simple construction provides ready adjustment for the brake, by merely taking up two lock nuts on the main brake lever. A unique oiler is used on this machine in which there is a disk having a series of pins, which disk is rotated by the engine and, during its rotation, picks up on its several pins a quantity of oil, which is wiped off into the tubes connected with the bearings. This insures positive feed of uniform quantity. A 12 horse power delivery wagon with two-cylinder engine, designed for R. H. Macy Co., was exhibited. This machine has been run on an average of eighty miles per day for over a month.

The General Automobile and Mfg. Co., Cleveland, Ohio—The General: A runabout with bonnet front having lockers; price $900; with detachable tonneau, $1,000; 8 horsepower; two cylinder opposed type of motor, 4x4½ stroke and bore; both valves are mechanically operated, being on the same cam shaft, and are readily removable; mechanical force feed lubricator; semi-elliptic springs front and rear; no reaches; artillery wheels with roller bearings and detachable tires; carburetter of mechanical valve type, with diaphragm adjustment, which when once set needs no further adjustment for all speeds under throttle; throttle control, which varies the compression from 15 to 125 pounds; planetary transmission; 200 mile tank capacity.

Century Motor Vehicle Co., Syracuse, N. Y., exhibit a gasolene car of entirely new design, which is driven by a 7 horse power single cylinder horizontally disposed motor, hung upon the I-beam fram and driving through chain to the balance gear of the rear axle. A planetary gear system is used in the transmission, giving two forward and two reverse speeds, all controlled by a single lever. The engine is controlled by a pedal operated throttle and pedal operated ignition device. Forced circulation is induced by a direct driven centrifugal pump. The gasolene and water tanks have a capacity respectively of fifteen and seven gallons, giving, it is claimed, a running capacity of 250 miles.

A specially designed carburetter is used provided with a float feed chamber and mixing chamber with an adjustable valve. It is connected through a throttle valve directly with the inlet valves of the engine. A unique arrangement of brakes is provided, of which there are two, arranged upon drums on opposite sides of the balance gear and operated in unison. An equalizing arrangement with improved adjustments secures proper simultaneous action of the brakes. A novel form of starting device is shown with crank arranged at the side of the seat and a chain and sprocket connection driving to the chain shaft. The sprocket upon the main shaft is normally unclutched, and a foot lever controls its position on a shaft. After the foot lever is depressed the sprocket member is clutched in and is then in position to turn over the engine shaft. As soon as the engine is turned over the sprocket is released, and thus insures the operator against back kicks. One-half inch ball bearings are used throughout, with wooden wheels and 3-inch detachable tires. A luggage box is provided in the box dash at the front, and the vehicle is specially designed as a light and low priced machine, unusually strong, and, although of light weight, making a very good touring machine.

Central Automobile Company, New York, distributing agents for Mors, Mercedes, Renaults and Peugeots, upholds the honors of Europe with an attractive exhibit including three cars, a two cylinder ten horse power carriage, and a four cylinder ten horse power touring car and a chassis of the 1903 eighteen horse power Mors car.

All these vehicles are so well known to the trade as distinctively foreign vehicles, that a detailed description is hardly necessary.

The particularly new features shown in the Mors chassis are the adoption of a me-

Digitized by Google

chanically operated inlet valves upon one side of the cylinder in place of the suction valves formerly employed. A new honeycomb form of radiator is used, combined with a fan driven from the main engine shaft. A governor of the ball type driven directly from the cam shaft gives an automatic control of the engine and this may be corrected by hand adjusted means. A pedal operated accelerator is also provided for cutting out the governor and accelerating the speed of the engine. The regular pressure feed lubricator is used, its pressure being supplied by a shunt from the muffler. A new and very simple form of sliding gear is used, giving four speeds forward and a reverse, with a direct drive through a positive clutch on high speed. The several speeds are controlled by a single lever. The regular brake is on the drum of the countershaft, while the emergency acts on the drum of the rear sprockets. The latter are lever controlled, are of Mors pattern of double shoe type, and actuated by a backward pull on the lever in place of the forward movement which was formerly used. A unique feature of connection is shown for the spark plugs, and consists of an insulated bus bar running along the top of the cylinders, and have pivoted thereon the contact connectors, which may be forced down over the propecting end of the contact members of the igniter plugs.

F. B. Stearns Company, Cleveland, Ohio, exhibited two attractive cars of the tonneau type, very rakish and powerful appearing; one, a tw cylinder twenty-five horse power machine, and the other a single cylinder twelve horse power. The engine in the larger machine is of the double cylinder opposed horizontal type and has its shaft arranged transversely of the vehicle, and driving into a chain gear mechanism. This mechanism gives three forward speeds and one reverse with double lever mechanism and the differential of the dividend rear axle. Brass water tanks are used on the engine, and a forced circulation of water is induced by a centrifical pump frictionally driven by a fly wheel. The engine is governed by the throw of the inlet valves which are controlled by a wedge co-operating with the valve stems. A hinged adjustment may be used to set the valves for any predetermined speed up to forty miles per hour. Two carburetuers are used, one for each cylinder and each of the flost feed type. The exhaust and inlet valves may be easily removed by taking out two bolts. Forced feed is used on the oil of the lubricating system and is belt driven from the engine shaft. The gasolene tank, having capacity for 18 gallons, the water tank and the radiating coil are all located forward and under the bonnet. A novel form of contact device is used comprising two hinged contact members held towards the cam by a single spring and provided back of the cam with platinum contact pieces. As the hinged members drop off the cam, contact members are very forcibly brought together high speed a direct drive is secured to the differential of the rear axle with all idle gears out.

Haynes-Apperson Co., of Kokomo, Ind., makers, show their popular and well known cars, but with a great many changes in detail, among them being a new bonnet for locker use. The body lines have also been improved. Roller bearings are used in the transmission; in fact, every bearing in the whole vehicle is a roller bearing except the main bearings of the motor. The ends of the main shafts of the motor, however, are roller bearings. A new aluminum radiator is furnished, which consists of tubes and washers made of aluminum, the washers being slipped over the tubes. The radiator is rectangular in form, and has a hundred square feet of radiating surface. The ends of the radiator are also of aluminum in a box shape, and it is believed to be the only aluminum radiator in the show. Its weight is about thirty-three pounds. The clutch system of transmission is used, but they still continue to use the horizontal motor of 12 horsepower, of 5-inch bore, 6-inch stroke, and pin their faith to it as being the correct thing. The new steering rod consists of the usual steering post surmounted at the top by a wheel. Its novelty consists in the steering box, which is attached to a tube crossing the car a short distance below the floor line in such a manner that the steering box, which is attached to the steering post, rotates about this tube. By this construction the operator may push the wheel forward so that the steering post stands in a vertical position, or it may be drawn back to any desired position by the operator and fastened by means of a small toe latch at any angle desired. The steering post, just before piercing the floor, passed through a ball of brass, which rotates pivotally on pins piercing it at opposite sides. These pins are attached to a brass sliding plate, which moves backward and forward through a grooved brass guide, which insures the steering post a steady position at all times.

American Motor Carriage Company, of Cleveland, Ohio, exhibits two runabouts having some novel features. The engine is a horizontal type single cylinder, developing seven to eight horse power. This is located just under the seat, and through a transmission gear of the planetary type transmits through the chain and sprocket to a differential on the rear axle. The jump spark igniter is used and controlled by an automatic ball governor. The speed of the engine is controlled by a foot operated throttle, carbaretuers are of the float feed type. A gear pump mounted directly on the main shaft of the engine produces a forced circulation of water through a tank provided with radiating flues and also through a radiating coil. Two expanding brakes are used on the drum of the rear wheel, in addition the reverse lever may be used if desired, as an emergency brake. The car is extremely simple, having few parts, and is substantially constructed and gives a light touring car at a comparatively small cost. The brakes are controlled by flexible connections and have equalizing devices to avoid skiding. The battery controlling switch insures a proper contact under all conditions. A steel armored wood frame is used on the chassis with particularly long flat springs for giving easy riding qualities. The wheel base is unusually long, 96 inches, and helps add to the car's distinguished appearance.

Elmore Manufacturing Company, of Clyde, Ohio, have two fetching and splendidly simple cars, one with tonneau body, having a double cylinder engine of the vertical type, giving ten horse power, the other having a double cylinder vertical engine of six horse power, engine under the seat, the Elmore two cycle motor being used in each. The touring car is the latest product. It consists of a complete chassis with removable tonneau and hinged bonnet. The two cycle engine, the only one in the show, is almost certain to command increasing attention. It is valveless and a single carburetter of an improved float feet type bolted direct to the engine frame is easily controlled. The shaft of the engine extends transversely of the body, and drives through sprocket and the chain to the change gear mechanism, which is also located transversely of the body and is of the planetary gear type. Three speeds forward and reverse are secured through the manipulation of a single lever and the reverse may be used as an emergency brake. All pinions of a planetary system are mounted on roller bearings and unusually large clutch bands are used throughout. From a shaft of the planetary gear system the drive is through chain and sprocket, through the differential of a dividend rear axle, thoroughly trussed to give additional strength. An apple (?) igniter is used and forced circulation is secured by a belt gear pump. The chain gear mechanism it is claimed, need only be used in shifting gears for hill climbing, and under ordinary circumstances the high speed gear may be immediately thrown in and entire control of the vehicle secured by a throttle lever acting upon a throttle valve arranged in the carbaretuer and adopted to vary the volume of the charge passed to the cylinders. The runabout has the same type of engine with simply modified arrangements of part, necessitated by mounting the engine under the seat instead of under the bonnet as in the case of the tonneau.

K. A. Skinner, Boston, Mass., United States sole agent of the De-Dion, Bouton Co., has an unusually attractive exhibit of the excellent production of the famous De-Dion Company seven vehicles, comprising a rockaway, brougham, tonneau, surrey, phaeton. In addition to the above there are exhibited four or five De-Dion motors and a very compact gasolene driven isolated electric plant for use in charging batteries or for isolated lighting plants. The excellence of the De-Dion work on these motors needs no mention and is quite up to the standard so long maintained by the company. Of the vehicles the phaeton shows the latest design and is provided with canopy top and adjustable glass face plate, thoroughly protecting the operator when used in conjunction with drop side curtains. It is equipped with a two-cylinder water cooled motor, mounted under the bonnet and in very compact form. The De-Dion Company still adheres to hand adjustment for the throttle and igniter, and no automatic ball governors are used in connection with the engine controller. The regular De-Dion transmission system is used, with a special clutch, and has a double clutch in the new motor, which makes it possible to secure threee speeds forward and a reverse. All changes of speed are controlled by a single operating lever. All parts are standardized and made interchangeable.

The Motor Cycle Mfg. Co., Brockton, Mass., show the Marsh motor bicycle, so improved as to be barely recognizable. The size and power of the motor has been almost doubled; it is now rated at 3 horsepower and is made an integral part of the bicycle being incorporated where the crank hanger formerly existed; the cranks are now carried behind the bottom bracket joint. A flat belt, 1½ inches wide, a ball-bearing idler, a sight feed oiler and fuel tank of increased capacity are among the other improvements. The price of the machine, $125, is not the least interesting feature of the machine.

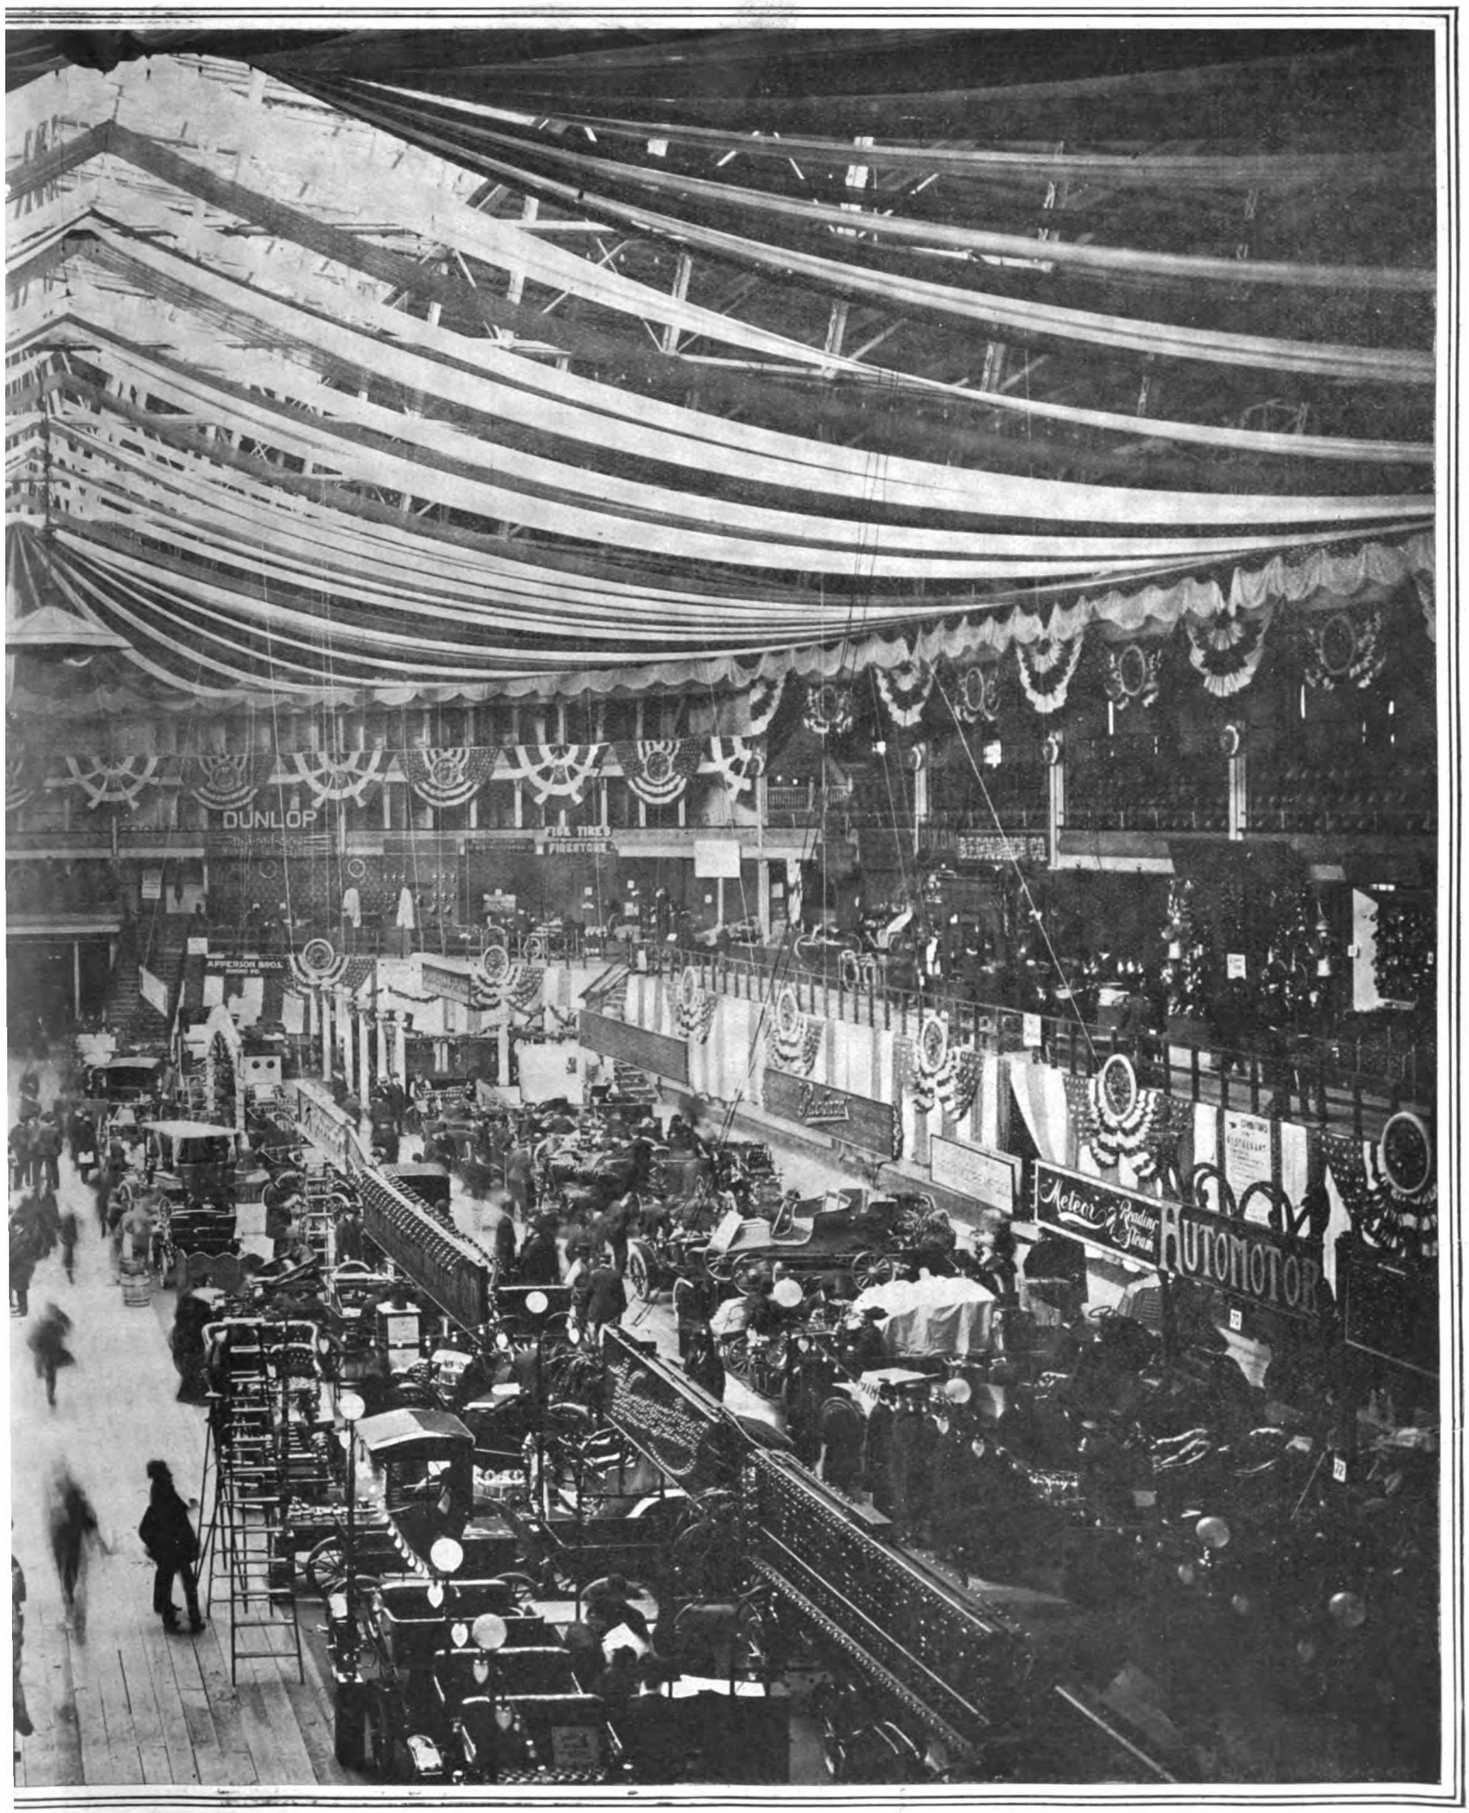
Byron V. Covert & Co., of Lockport, N. Y., show a little light gasoline single cylinder upright motor runabout which sells for $500, and which they call the Covert Motorette. It weighs less than 450 pounds and is made to carry two passengers. It has a tubular running gear and all the principal machinery, such as the motor, transmission gear, etc., is attached direct to the frame, so that the body is relieved of all vibration, the main frame being connected to the front axle with a swivel connection. Four full elliptical springs are used, made from Swedish steel, with single leaves of taper stock, and they look so light and small that the question is naturally asked whether they are strong or not. To this query Mr. Covert said that they never had one returned which was broken. The motor is a single cylinder type, water cooled. The whole construction, while light, is evidently of good material and well designed, and is one of the best $500 vehicles of the show. They also show another car called the Covert Chainless, costing $750, which has an angle iron frame with four semi-elliptical springs. The motor is of De Dion type, with water cooled single cylinder, and is placed transversely in front of the car under the bonnet. It has a 4¼ stroke, 3¾ bore, and 1,500 revolutions, and will give five horse power under brake test. Attached to the motor is an additional aluminum case containing a combined brake and clutch. By pressing the foot pedal slightly the clutch is disengaged from the flywheel, which is secured to the motor shaft, and by pressing the foot pedal still further a leather band on the clutch comes in contact with a drum acting as a brake. This affair is fitted with a spring which causes the clutch to return to its place immediately upon releasing the foot pedal. This spring also takes care of the end thrust of the connecting drive shaft. The cardan joint is fitted with ball bearings that reduces to a minimum the end thrust of the clutch. The change gear is the sliding gear pattern and is attached directly to the rear axle housing and drives direct on the high speed. A radiator is placed in front of the motor, which has been carefully tinned after being assembled, so as to prevent any leaky joints and rusting. A small push button in the floor of the body controls the reverse, so that it is an impossibility to throw on the reverse gear without first pressing this button.

Country Club Car Co., Boston, Mass., show the most original Yankee car in the show; certainly nothing in its construction is copied either from the German or the French. It has a double cylinder opposed 10 horsepower horizontal motor, 5-inch stroke and 5-inch bore, using a scavenging charge of air. The valve, or valves, is mechanically operated, and is practically one, being of a piston type operated by a cam and rocking lever from a short secondary shaft. The transmission is also peculiar and original, being of the planetary type, worked by compressed air taken from the motor cylinder and stored in a small receiver alongside of it. Three small cylinders in which pistons are operated by compressed air control the transmission gears, and these are located on the left hand side of the body directly behind and underneath the seat. On the left of and outside of the seat is a short crank lever which controls these small cylinders and pistons by a toothed segment, and any desired gear can be used and locked in the required notch and held in position until released. Three speeds forward and reverse are provided. All the mechanism is inclosed in a body, and therefore dust proof and easy of access, so that there is never any need of going under the body. The water radiator cooler is in front, and is operated by a centrifugal pump, which is worked by a friction disk on a flywheel. The sides of the body form the water tank. The ignition is by make and break, and the oil is fed mechanically by a ratchet working from the motor, which turns a nut on a screw and forces a plunger through the oil receiver. The car weighs 1,400 pounds and costs $1,200.



H. H. Franklin Mfg. Co., Syracuse, N. Y., are attracting a deal of attention because of their having the only car in the show having a four cylinder air cooled motor. A complete chassis is shown, and also two fin-

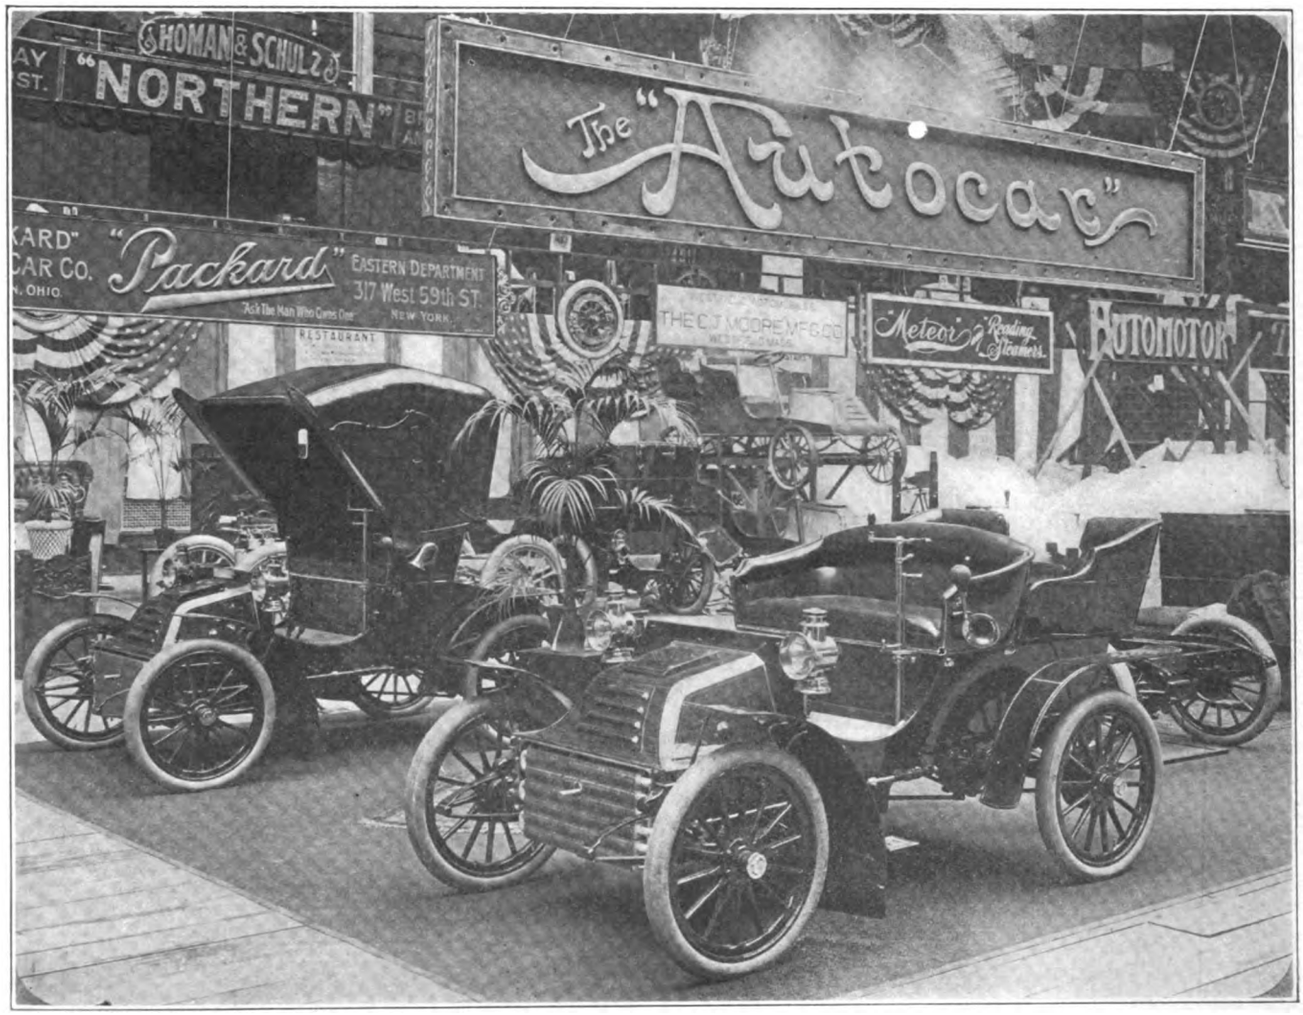
GENERAL VIEW OF THE SHOW IN MADISON SQUARE GARDE



Digitized by Google

DEN LOOKING FROM THE FOURTH AVENUE GALLERY.

Digitized by Google

ished cars. The body, which carries a regulation bonnet in the front, although single seated, has divided seats with rounded backs, giving a peculiar tonneau effect to the single seated body. The frame is of angle iron with wood reinforcements, and is carried on four full elliptical springs. The motor, as has already been mentioned, is a four cylinder air cooled, of the vertical type, but the cylinders are not arranged in pairs, all four being carried in a straight line laterally across the front. Both the inlet and the exhaust valves are on the top, or head, of the cylinder, and both are readily detachable by removing two bolts. The oil is fed from a large reservoir, which carries about three quarts of oil, to a smaller reservoir connected with a pump which is driven by an eccentric from the motor, so that the supply of oil is regulated by the speed of the motor. The ignition is by a dynamo operated by a cone friction drive on the flywheel and controlled by a governor. As an auxiliary a storage battery is used, which is charged from the dynamo by using the excess of current generated. The crank shaft differs from the ordinary crank shaft of the four cylinder construction by having five bearing points instead of three. The transmission is of the planetary, or epicyclic, type, without any bolts, the five little pinions tending to take the strain off. A long chain drive is used to the rear axle, and the popular fad of driving direct on the high speed is used, of course. The spur gear differential is made specially for this wagon by the Brown-Rize Co. In the motor a very heavy connecting rod is used, having large bosses and flanged edges or grooved sides to add strength to it and to carry oil to the bearings. A square, hollow casting containing four inlet pipes is bolted to the cylinders, and a large brass pipe enters this casting in the centre from the mixer, so that the middle cylinders get as large a supply of gasolene as the end ones do, there being no loops or joints to interfere with the rapid passage of the gas. The throttle to the gasolene supply pipe is on the wheel steering pillar, as is also the spark advancer, which consists of a gear driven shaft having four cams, and which actuate springs for each wire connection, and on the end of this shaft is a combination fibre and brass disk, having two contacting points, which produce a make and break spark. It is one of the most ingenious spark advancers in the show. Two brakes are provided, one on the differential and one on the transmission. The car weighs about 1,100 pounds and costs $1,300. It certainly is a high powered car for two passengers, being immeasurably more powerful than many of the tonneaus shown.

Apperson Bros. Co., Kokomo, Ind., show a 24 horse power touring car with a horizontal motor of the double cylinder opposed type. Each cylinder is located on the opposite sides of a central crank chamber and one vaporizer is used on each cylinder, both being controlled by one lever which is operated by a foot pedal. The speed of the motor can be regulated in this way from 200 to 1,200 revolutions per minute, and as readily responds to the throttle as a steam engine does. An ingenious system of water circulation is employed, using a pump which is gear driven. The water flows to the pump by gravity and then is forced from the radiating coils. For ignition a magneto is used, supplemented by a storage battery of large capacity, using the advance spark system, with a make and break contact. The lubrication is by a powerful mechanical force feed pump, mechanically operated, which has ten feed pipes. The speed controlling gears are of the shaft gear type, and the four speeds are controlled by one lever. One flywheel clutch of the taper cone pattern drives the car and is thrown out of gear at all times except when the car is in operation.

Hall Motor Vehicle Co., of Dover, N. J., show a handsomely finished tonneau car mounted on a reinforced wooden frame with the popular half-elliptical springs, with body irons in front and rear. A horizontal double cylinder opposed motor is in the rear of the car, cooled by a rotary pump with a radiator in the front under the hood. The cylinders are 6x6 inches, of 20 horsepower at 1,000 revolutions. A make and break spark is used, operated by a spring actuated rod working on the secondary cam shaft. In operation this rod is positive in its action, and is not affected by the oil and is very effective even at a very low speed. A system of direct spur gearing is used for transmission, the pinions being on the main shaft or sleeve of the motor, having an intermediate spur gear between that and the spur gear on the rear axle, the differential being car-

Digitized by Google

ried inside the larger spur gear on the differential; the speed gears are of the planetary system, so that it will be readily seen that the object of placing the motor in the rear of the body and over the rear axle is to provide a close connection between the main shaft of the motor and the rear axle of the system of spur gearing employed. Mr. Hall says that while this system of spur gearing is new to the shows, his experimental carriage has been run on the roads of New Jersey for two years with great success. It is also to be noted that the rear part of the motor rests firmly on the rear axle, and the front part of it is carried to a cross sill on the main frame. A disk containing a suitable number of holes is placed over the engine, and oil feed pipes lead from them to various oil ports, and the oil is pumped mechanically to a tank covering the holes in this disk, the pump being connected with the rear axle so that when the car stops the oil ceases from flowing, and so is not wasted. The spark is advanced by a foot pedal. All the controls are operated from the seat, and the foot brake operates on the rear wheels. A foot button on the right side of the car advances the spark, the object of this being to avoid danger in starting the engine, the foot button always being in normal position for starting when the engine is on centre. The price of the car is $5,000.

E. R. Thomas Motor Co., Buffalo, N. Y.—A new tonneau at $1,400; 8 horsepower; single cylinder; having four piston rings grounds to one-thousandth-inch, with mechanically operated valves, both operated by one cam. French system of slide transmission without bevel gears; three speeds forward, one reverse; pressure oil lubrication; one lever control; steel frame tapered, reinforced with angle iron; aluminum fenders; a foot lever disengaging the power, and when the brake is applied the motor also runs free; detachable sprocket for racing on hilly countries; a new mixer of constant level type, changing both the air and gas at the will of the operator; any quality of gasolene can be used in any weather; artillery wheels with roller bearings and detachable tires; spark and throttle control on steering rod; lubricating pump geared to the motor; rear axle trussed in front and underneath; double acting brake. Body of London smoke color, with tufted leather upholstery of best quality of hair and springs. The whole construction is substantial and of great simplicity; a complete chassis is shown; also the well known Thomas motor bicycle, incorporating three great improvements—the spring truss fork, hygienic cushion frame and combination leather and steel chain belt that gives the elastic qualities of a belt with the unstretchable nature of a chain. The belt is a round twisted one of one-half-inch diameter, into the hollow core of which is drawn a block chain about one-eighth inch in size. It looks as if the question of belt or chain drive was solved by this combination, and that the rigidness of the chain can in this way be overcome by the yielding nature of the belt.

Northern Mfg. Co., Detroit, Mich.—The Northern, exhibited by Homan & Schulz, New York City. A runabout at $800; single cylinder; 5 horse-power; both valves mechanically operated from one cam shaft; starts from seat with one turn of starting handle; new design of carburetter under throttle control; planetary transmission, with 1¼ face bronze and steel gears to prevent slipping; large side springs, with elliptic part spring; the body is hung on a balanced swivel so that the vibration and dip of body from the motor is not imparted to the body, as in other forms of side spring construction; artillery wooden wheels with ball bearings and detachable tires.

Foster Automobile Co., Rochester, N. Y.—The Foster, a light gasolene touring tonneau at the low price of $1,400; a departure for this concern, which heretofore has made steamers only. It has a 9 horsepower upright, two cylinder, water cooled motor, under front bonnet; all parts of motor and gear cases oiled from central oiler; ignition by jump spark system; two speeds ahead and a reverse; clutch is inclosed with compensating gear in oiltight case; artillery wheels, detachable tires; long wheel base; platform springs; wheel steer; bevel gear shaft drives; tonneau body complete with fenders, baskets, horn, three lamps, brass trimmings; weight, 1,100 pounds; also show a combnation light roadster steam wagon for two or four passengers, with detachable front seat, which, when detached, has a bonnet front; reachless running gear, which gives low centre of gravity; platform springs, with artillery wood wheels, ball densing coils in front; new 6 horsepower engine; fuel capacity of thirteen gallons for 175 miles; water capacity eighteen gallons for two days' use with condenser; platform springs with artillery wood wheels, ball bearing and detachable tires; flaring fenders; black body with red running gear. There is also shown a substantial steam delivery wagon.

Sidney B. Bowman, New York, shows three cars, a Thomas tonneau, a Panhard and a model of the new La France touring car, built by La France Fire Engine Co., of Elmira, N. Y., which is of the medium touring type. The upper part of the body is of aluminum, the base of wood and having a set of continuous wooden fenders over both wheels. The body of the tonneau style is the product of J. M. Quimby & Co., of Newark. The frame is of the armored type, with wooden sills having broad steel plate reinforcements, very broad in the middle and tapering at both ends similar to the familiar bridge type of construction. The front axle is solid and curved and fitted with half elliptic springs, which are hung to the body irons, as are also the rear springs; the rear axles are solid and of a square section. Wooden artillery wheels, fitted with 36x3½-inch detachable tires, are used. The motor is of the four cylinder vertical type, 20 horsepower, with induction and exhaust valves that are both mechanically operated by separate cam shafts driven by gear wheels on the main shaft. A three tier, double coil, four row radiator is in front of the frame between the projecting front spring ends. The ignition is by dynamo and storage cells, which are fed by the dynamo, so that there is no danger of these being fully discharged at any time. The motor is lubricated by a liquid oil gravity feed. The transmission gears are oiled by solid Albany grease feed from a cup and valve operated manually. The water circulation is fed by a pump attached to the motor by a gear wheel. A numbered pressure gauge with a needle on the dash shows by its position and fluctuation how fast the engine is running by the pressure of the water on the gauge. Four speeds forward and one reverse are controlled by one lever at the right of the operator. Another lever being for the emergency brake, a foot lever brake is also attached, and a foot lever is supplied to throw the clutch out of gear, and when either brake lever is applied the clutch is thrown out of gear. There are three two toothed sectors on the steering pillar underneath the steering wheel, to which three short toothed handles are attached. One controls the gas, another the spark and the third one the air. The bevel drive is to a differential countershaft, and from there by a double chain drive to the driving wheels.

The Buckmobile Co., Utica, N. Y., as its name implies, has a buckboard car. A pair of flat wooden reaches about six inches wide and one and one-half inches thick run from the front axle to the top of the truss on the rear axle. A pair of wooden sills cross these wooden reaches about fifteen inches from each axle, and extend about three inches on each side of the broad reaches. These sills are fastened on each side to long leave springs on the automobile style, and on top of these the body rests. The front axle is solid, and the rear axle is live with a differential spur gear. The body is ash, with recessed veneered panels of curly whitewood, the dash being made of the same material. A double cylinder vertical motor of 10 horsepower is carried under the seat. The drive is direct on the high speede. The car weighs about 900 pounds. The wheels are of the wooden artillery type, fitted with detachable tires. Two brakes are furnished, one on the rear axle differential and the other on the transmission. Lever starting is employed from the centre pillar.

The Standard Automobile Company, of New York, show the Decauville (French) cars, giving respectively ten and twenty horse power; one, a two cylinder and the other a four cylinder, both of the tonneau type. A new feature of this year is the automatic governing by a centrifical governor, which throttles the amount of mixture passed to the cylinders. The speed of the vehicle is controlled entirely by the adjustment of the spark, which is hand controlled. Another feature is the use of a dynamo igniter combined with a storage battery, and provided with an automatic cut-out and cut-in which assures full charge of the battery. This is used until the machine has obtained a speed sufficient for generating the necessary current for the igniting generator system. Sliding gear transmission is used with the direct drive of the third speed. A new feature of the twenty horse power car is a double rear axle conctruction. The inner or main shaft of which may be removed without disturbing the wheel adjustments or outer tube which extends from both sides of the casing of the differential gear. New springs have also been adopted over the rear axle of the half platform type, giving easier riding qualities.

The Walter car, New York, attracts some little attention and disclosed several novel features. Three complete cars are shown, one a four-cylinder and the others having two cylinders. One of the features of the machine is a chassis frame of tubular construction, supported on half platform springs at the rear and half elliptics forward. This frame forms a positive support for the engine and all driving mechanism. The engines of special design are secured to the frame and a direct drive with universal couplings is provided between the change gear case and divided rear axle. Sliding gear transmission is used, giving three speeds forward and one reverse, all controlled by a single lever. A novel arrangement of clutch is used, comprising a main clutch member of conical form co-operating with a conically shaped co-operating member, secured to the rear of the fly-wheel. A depression of the clutch pedal drives the movable member of the clutch forward to-

Digitized by Google

ward the fly-wheel to release it. The engine is governed by a centrifugal governor, operating directly on the throttle. Either mechanically operated or poppet inlet valves are provided. In addition to the automatic throttle governor, there is a hand adjustment for varying the amount of gas passed to the engine. This does not affect the action of the governor. The carbureter is of the float feed type, with usual adjustments, and the water circulation is induced by a frictionally driven centrifugal pump, hinged to the tubular frame and spring pressed against the fly-wheel. Two brakes, pedal operated, one acting directly upon a drum upon the main driving shaft and the emergency brake acting upon the brake drums of the rear wheels. The emergency brake is interconnected with the clutch and insures throwing it upon application of the brakes.

Cleveland Automobile Co., Cleveland, Ohio, shows two tonneaus, one surrey and two runabouts. One of the tonneaus has a detachable body with a false back. The other one has side doors, but the step is too high except for a giant. They have also a complete chassis showing their single cylinder construction, and another complete chassis containing half the front part of a body, with a two cylinder horizontal type of opposed motor, with a 5-inch bore, 6-inch stroke and of 16 horsepower. The oiling is done from the exhaust and is operated by a large cam. The carburetter is jacketed and heated by the exhaust. When the brake is thrown on the clutch is thrown out, which now appears to be very common and a good practice.

The Loomis Automobile Co., Westfield, Mass., display a big touring car with detachable tonneau. A powerful two-cylinder upright motor is used, having thirty-two square inches of piston area cooled by a forced system of water circulation passing through a number of ⅞ tubes, forming a radiator. The water is always above the cylinder and the radiator below, hence no vacuum can be formed. The transmission is by an individual clutch system, so that any gear can be picked up without checking and without passing through any other gears. Three speeds forward and one reverse are provided, all accomplished with one lever to which is attached a hand latch which locks itself, so that no mistake can be made in using the gear. The control of the motor is by a throttle and sparking device, and is without a vibrator. It is claimed that no adjustment of it is ever needed, as it has a rolling contact like a trolley on a trolley wire, and having only a primary circuit there is no danger of a short circuit. In fact this trolley is kept covered with oil, as it operates better with oil than without it.

Knox Automobile Co., of Springfield, Mass., show a chassis without wheels, standing on end, so that the motor is vertical, with the crank case cover removed and a hand crank attached, so that its operation may be readily noted. Its new features this year consist of a larger cylinder, one inch having been added to the bore, the stroke remaining the same. The belt driven pinion is somewhat smaller and its shape has been somewhat altered. The weight of the whole car has been increased about 200 pounds. A new disk clutch for high speed has been furnished, and twenty-four inches of tubing has been added to the muffler, making three tubes instead of two, as last year. Another important change is the employment of wooden artillery wheels in place of the direct spoke wire wheels that were formerly used.

The Spaulding Automobile and Motor Co., of Buffalo, N. Y., show, in addition to their runabout, a touring car of 25 horse power, with double cylinder vertical motor in front in a brass bonnet. The extreme novelty is the method of starting the motor from the seat. By pressing an electric push button on the dash a spark is produced which starts the motor without any preliminary cranking, a charge being retained in the cylinder under atmospheric pressure, it being necessary, of course, to leave the motor in a certain pre-determined position to permit of this. The controlling system is also different from any other car in the show, being actuated by a crank lever on top of and working through a fixed upright or stanchion in the centre of the car and intended to be operated by the left hand of the operator. The usual wheel steering device being to the right of it, it having a hinged steering pillar for easy access to the seat; a clash system of transmission gears is used with a direct drive on the high speed and a double chain drive with plain bearings at rear axle. The foot brake also acts on the transmission.

O. H. Keep, New York, shows the Fiat, an Italian car, one of the main features of which is the transmission system, the gears always being in mesh and controlled by one lever giving three speeds forward and a reverse. The gears are perfectly noiseless, and after their long use show no signs of wear. The motor is a four cylinder upright, with 16 horsepower, having a double chain drive to the rear wheels. A make and break spark is used, furnished by a magneto, and the spark is advanced by a governor on the main shaft, which varies it according to the speed of the motor. A combined cooler and water tank, composed of a nest of small tubes giving a very minimum water surface with a maximum air cooling surface, is used, and which are additionally cooled by a fan behind it which is driven off the main shaft. The oil feed is by water pressure, which goes to the oil tank, causing it to overflow and fill the supply pipes. If the oil should cease to flow a sight feed on the dash indicates it to the operator, and he knows at once that the water is not moving and requires his attention. A square front bonnet of the Mercedes shape is used with this cooler and fan.

Kensington Automobile Mfg. Co., Buffalo, N. Y., has a tonneal with a 12 H. P. Kelecom double cylinder vertical motor, having double opposed vertical cylinders of 4-inch bore and 4-inch stroke. The motor is fitted with a balance wheel, the interior rim of which is cone shaped. A leather covered pulley fits into this rim, forming a clutch, which is released by a foot pedal. A shield prevents the oil from entering the clutch and causing it to slip. The clutch connects with the transmission shaft, being fitted with three stationary gears of different diameter, which mesh with three sliding gears, also of different diameter, upon a parallel shaft connecting with a flexible shaft. The shaft drive is of the compensating, bevelled gear make on a live axle. All the gears are fitted with ball bearings. The radiator has sixteen copper coils, with copper disks, and a rotary pump connected with the motor shaft to keep the water in circulation.

H. Barthol Brasier, Philadelphia, Pa., exhibits one car of rather attractive design equipped with a tonneau body with canopy top with enclosing curtains, with adjustable glass front guard. The engine is two cylinder type, 15 horse power. A unique feature of control is shown including a water pressure operated throttling valve. The circulating pump which is of the direct drive gear type, creates under varying speed different pressures which, acting upon a diaphragm, controls the pressure of the throttle. Its lever is arranged over the steering pillow and controls a bye-pass, which, of course, varies the pressure. The ignition is governed entirely by hand. The change gear mechanism giving three speeds forward and one reverse is controlled by a single lever. The gears are always enmeshed, and several sets are thrown into or out of commission by shifting clutches. The igniter lever is inter-connected with the main oil supply, thus insuring the oil being turned on and off as the vehicle is started and stopped. Just back of the main gear shaft is a ratchet wheel, and instead of using a sprag to prevent retrograde movement of the machine, a pawl is dropped into this ratchet absolutely locking the driving mechanism.

Smith & Mabley, New York, manufacturers of the American C. G. V. and importers of Panhards, Mors, Renaults and Mercedes, have, as usual, a very attractive exhibit on the main floor, including the foreign made machines, together with the American C. G. V.; in all some twelve vehicles are shown, including one complete chassis of the C. G. V. type. It is unnecessary to say that the foreign built machines are all elegant in every appointment and quite up to the standard so long maintained by the foreign builders.

Sandusky Automobile Co., Sandusky, O., a newcomer, shows a new light gasoline runabout, having a piano box body, with a rounded bonnet front on top of the dash. It weighs about 600 lbs. and has a horizontal single cylinder motor of 4 horsepower. The water circulation is of the natural type, without pump, the tank being elevated; the water is fed by gravity to the top of the motor and returns to the tank by another pipe from underneath the motor, and when the car is at rest the circulation is reversed, which prevents it from freezing. It has a double chain transmission drive without gears, it being claimed for this system that should a chain break it is easily repaired, whereas a gear which is once stripped requires a new one in its place. The gasolene control is by a foot push button, and there is also an exhaust cut out. The body is mounted on long leaf side springs, resting on sills wholely outside the body, which gives a low centre of gravity.

Whitney Automobile Co., Whitney Point, N. Y., has a runabout with a single horizontal water cooled motor of 6 horsepower, using a "make and break" spark, governed by a foot lever changing time of ignition. The motor and all other mechanism are attached to a set frame, which is put together with hot rivets. The transmission gears are in two cases around the main shaft of the motor, and of the friction clutch type; when the high speed is thrown in all of the gears are out of use and the power is transmitted directly from the main shaft. The muffler has a cut out valve that is operated by the foot pedal. The cooling system consists of a large radiating coil, with a rotary circulating pump driven by chain transmission from the main shaft of the motor. The carburetter is of the float feed style, and has a sight feed, so the quality of the mixture can be easily seen and is controlled by a lever operated from the seat. The rear axle has a roller bearing under each back spring; also a roller bearing near the middle of rear axle attached to the strut rod, which relieves the strain from the driving chain.

Digitized by Google

American Georges Richards Co., represented by Barry & Hayes, New York, have an attractive display of three vehicles, a 24, a 10 and a 12 horse power. In addition to these two vehicles, they exhibited W. K. Vanderbilt Jr.'s Renault racer of 26 horse power. The particularly new features of the Richards is the adoption of the magneto generator system for the ignition in place of the old battery system. The same driving shaft operating the magneto actuates a mechanical lubricator. The engine is governed by a throttle, either by automatic governor on the Morse plan or by a hand operated lever. The ignition is hand adjusted. Improved grip detents are provided on brakes and change gear levers.

Duryea Power Co., Reading, Pa., is again showing its three wheeled runabout with Duryea's famous three cylinder vertical motor and single hand control. No changes have been made in the general appearance and detail of the carriage, excepting that new and improved springs have been added, and an automatic spark advancer, which is run from the cam shaft which operates a governor that varies the speed, making it particularly easy for starting. The motor has a new connecting rod which is flanged or grooved so as to catch the oil and economize in its use. Duryea still uses the hammer break spark with a naked wire, having, however, a new brass double spring clip for fastening the wire to the plug without a nut, and is readily detachable, and which, since Duryea has brought it out, has been adopted by Mors, of Paris.

Warwick Cycle & Automobile Co., of Springfield, Mass., exhibit their Warwick cars, which are very similar to their product of last year, save that wooden artillery wheels replace the wire wheels and a longer wheel base is provided. Larger and more comfortable seats are used, and the details of the centre pillar steering have been improved, the motor is now hung on springs instead of on the running gear; a larger and stronger chain is used. A Warwick motor bicycle, a chainless, is also shown.

Henri Fournier, Paris, France, displays a big 60 horsepower Mors, which is ticketed as having been sold to William R. Hearst. A Mors magneto, driven by spur gear from a dynamo, is shown in open section so that the operation of the sparking may be seen. An ingenious method of making contact between the wire and plug is shown by a forked prong end system of contact.

Mechaley Bros., Stamford, Conn., show an assembled car using a Brennan double cylinder opposed motor of 12 horsepower and the Champion differential spur gear. It weighs 1,450 pounds and costs $1,500.

Motors

That mechanically operated valves are novel, or confined to foreign motor practice, is an assertion the fallacy of which is easily proved by an examination of a number of American-built motors. Of the concerns showing motors alone, four, the Buffalo, the Rutauber, the Conger and the Auto-Supply Co., all use such valves. No especial virtue is claimed for this practice, beyond the fact that it is thoroughly mechanical, and novelty is about the last thing thought of. The Conger people, for example, have used it for three years.

It was formerly said that American motors were much inferior to those of foreign manufacture. Such impeachment no longer holds. There are motors at the show that in workmanship, as well as design, are marvels. All crudity has disappeared. The product is highly finished and thoroughly efficient. If foreign motors are selected it is for reasons other than the inability to secure good ones of home manufacture.

Seven motors in all are shown separate from cars—the four already mentioned and the Brennan, the Kelecom and the De Dion, the last two being, of course, of Belgian and French make. Of these the Brennan, the Rutenber and the Conger are furnished in both the vertical and horizontal forms. The remainder are shown only as vertical engines.

Buffalo Gasolene Motor Co., Buffalo, N. Y.—The specialty for the coming season is what is termed the Tonneau Motor, a four-cylinder, vertical water cooled 8 H. P. engine of fine appearance and containing a number of excellent features. Chief among these are mechanically operated inlet valves. All motors are equipped with metal enclosed bases, with sufficiently large detachable panels so that access to all adjustments are easy. The valves are solid steel forged, accurately ground. There are five heavy bearings in base of motor, assuring firm journals for crank shaft. These bearing caps are all held in proper place by double lock nuts and split keys, consequently there will be no trouble of lost nuts and loose bearings. There is no packing excepting under the water jacket plate, and with this there is no trouble, as there is no pressure to blow it out. The sparker plugs on top of motors all have a double seated ground point, absolutely compression tight. The cams operating inlet and outlet valves are all on one shaft, and they are pinned on the shaft, assuring positiveness in opening the valve at absolutely the right time. Just above the valves, in center, are valve plugs. Should any valve leak, it can be taken out in thirty seconds, reground and replaced and ready to run in two minutes. All the four cylinders are fed with one vaporizer through one inlet casting. The cylinders are 3 7-16 x 5 inches, and the motor runs at a normal speed of 700 R. P. M.

Conger Mfg. Co., Groton, N. Y.—Stolz gasolene motors. Both from the wide range of patterns and the abundant evidences of fine workworkmanship and finish, this exhibit is notable. The vertical motors are made with one, two, three and four cylinders, and the horizontal with one and two, the latter of the well-known opposed type. The cylinder dimensions are 4 x 4 and 4½ x 4½ inches, either size being given, while the single cylinder horizontal motor is 4¾x6 inches.

Mechanically operated intake valves, or non-automatic, as it is termed, are employed, both actuated by cams mounted on the secondary shaft. The sparking device comprises unique and practical electrical principles involving "jump-spark," or "make and break," system employing commutator, and transmitting current in two distinct and separate directions, making ignition assurance doubly sure. This method positively avoids failure to properly charge cylinder and exert proportionate energy at each impise. The valve must unseat no matter how otherswise influenced. No failure of explosions is liable, owing to double point of contact closing circuit that sends sparks to ignition chamber from two sources simultaneously.

Brennan Mfg. Co., Syracuse, N. Y.—Brennan standard gasolene motors. Of these motors their makers frankly say that the horizontal type is the favored one; a double cylinder vertical motor has been added, however. The regulation motor is of the double cylinder opposed type, water jacketed, having cylinders with double thrown cranks 180° apart. The pistons are on a horizontal line on opposite side of shaft. The rods being on separate cranks, balance the reciprocating parts, giving an impulse alternatedly one per revolution, entirely eliminating vibration.

The valve chamber, cylinder head and cylinders are cast integral and are full water jacketed, being in one piece there are no joints to leak water or compression.

To facilitate inspection, the top of the case can be removed without disturbing any of the adjustments, giving full access to the crank case for inspection or adjustment of parts. The crank shaft rods, and pistons, can be lifted out if desired. The case is dust proof and oil tight. There are no joints in the bottom part of the case for the oil to leak out.

Charles E. Miller, New York—Exhibits the Rutenber motor, made by the Western Motor Co., Logansport, Ind. The principal models are the 2 and 4 cylinder, vertical water cooled motors, althought a 4-cylinder air cooled is also carried. Mechanically operated intake valves mark these motors. By their use a full charge at each suction and full exhaust of the charge at its proper interval is secured, and no valves ever stick to prevent the proper action of the motor.

The valve boxes are so constructed that all valves may be easily removed or reground to their seats without disconnecting any of the parts of the motor.

K. A. Skinner, Boston, Mass.—De Dion-Bouton Motors. The product of the famous French house, the apostle of high speede vertical motors, is shown in a variety of styles, ranging from the 1 to 15 horsepower. Up to and including 9 horsepower, the motors are single cylinder; the 12 and 15 H. P. sizes have two cylinders. The changes are mainly in detail, a quickly detachable commutator plate and a small button shaped valve on top of the intake valve taking the place of the compression tap formerly used.

A. H. Funke, New York.—Kelecom Belgian vertical motors. Although used in this country for less than a year, these motors have made an enviable name and are being used on a number of well-known cars. The sizes imported range from 1¾ to 11 horsepower, those from 5 H. P. up being water cooled, and the 9 and 11 H. P. sizes having two cylinders.

Electricity

That the electric vehicle is no passing fancy and is an art in vehicle construction which is here to stay and grow to unusual proportions is amply indicated by this year's show.

While no very radical departures have been made in the bringing out of particularly novel apparatus for the electric vehicle, the show in both heavy and light electrics is better perhaps than ever before. The general advance movement seems to be toward simplicity, increased capacity of operation, and as low weights as are consistent with good practice.

The lighter vehicles of the runabout type are adopting ball bearings both in motor equipment and for the wheels. On these vehicles the body suspension of motor with chain drive is the most popular. The efficiency of motors has been greatly increased, but this, of course, is due to the advances made by engineers in adapting well known types of motors to vehicle uses. The number of poles on the motors have been increased, and where originally the two-brush motor appeared the four and even six-pole motor is now being adopted.

The underslung battery is, of course, popular and proper on the heavy vehicles, with individual motor drive direct on the rear wheels. In one instance, however, that of the light runabout of the Electric Vehicle Co., a divided underslung battery is used, with the motor hung between the two battery sections. In this carriage the reachless frame is used, with side spring body suspension. The Studebaker Co. have this year been added to the list of electric vehicle manufacturers, and show a reachless frame, having a flexible tubular construction bearing all weights and supported over the springs. The electric brake is becoming more popular, and the controllers are much simplified. The Westinghouse Electric Mfg. Co. appear this year with standardized parts, and will materially aid the growth and popularity of the electric vehicle.

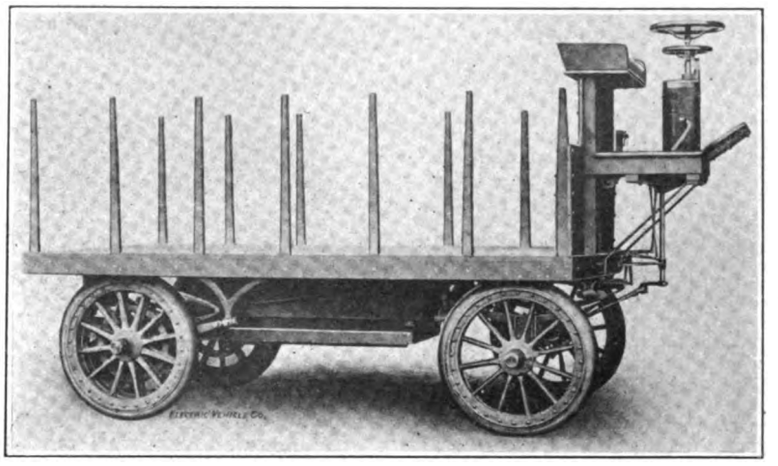
For heavy truck work the electrics are more popular than any other type, and the growth in this direction is undoubtedly stimulated by the ease of operation, which permits the use of ordinarily skilled operators. The electric was, of course, one of the earliest vehicles in the field, and naturally the commercial world looked first to it for the solution of the transportation proposition. In this field it certainly is not only holding its own, but growing to unusual proportions. It is a labor saver, and therefore economic for heavy work, as is shown by its adoption by the New York Telephone Co. in their cable truck.

While considerable furore has been created by the proposed Edison storage battery, its adoption is not confirmed by an examination of the vehicles in the show, and the almost universally used Exide type of battery seems as yet to be the best storage battery system available. Private carriages, including broughams, hansoms and victorias, are gaining popularity, and in lmost every instance use the underslung method of battery suspension giving light weights. The light electric runabout is evidently growing in popularity for city use.

The Electric Vehicle Co., Hartford, Conn., has one of the largest and most attractive exhibits, containing some thirteen out of the twenty different types of Columbia automobiles listed in the company's catalogue for 1903, and including both gasolene and electric vehicles. As showing the new departure of the company in electric vehicles, the most noted examples are the Columbia inside operated coupe, the Columbia light runabout and the Columbia truck. The gasolene car is treated of in the department devoted to that form of power.

The coupe is designed to meet the demand for a thoroughly closed car operated from the inside and to dispense with the necessity of a driver. It is particularly adapted for physicians' use. When the windows are raised the occupant is thoroughly shielded

Digitized by Google



from the weather, although all windows are arranged to be dropped, giving what is practically an open vehicle. The controlling, steering and brake levers are all conveniently located within the compartment. A divided battery is used, one portion being located over the front axle while the other is arranged at the rear boot.

The light runabout also incorporates radical departures. The base, or frame, of the body is of angle iron, and is supported upon side springs extending between the forward and rear axles. Each of these springs is divided into two sections, each having independent leaves, and both spring sections being joined to the body at or near its centre. Upon one side the spring is connected to the body through a pivot, which gives the very necessary three point support for the vehicle body and will permit an elevation of a wheel to the height of some seventeen inches without bringing undue strains upon any of the parts. The battery is of the underslung type, provided with means for easily dropping it from the battery compartment, and is arranged in two sections, each having Exide cells fore and aft the centre of the body, thus distributing the battery weights with relation to the two axles. A motor of special design which weighs but one hundred pounds, and for its weight has an extremely high efficiency, is located between the two battery sections, and through a double reduction gear and chain drives to the balance gear, which is arranged upon the rear axle, which is a live axle. The parts of this axle are thoroughly inclosed to exclude dirt, the hubs of the wheels being recessed and extending over the outer casing of the live axle. The wheels are all of the same size and run upon ball bearings. A controller of the Rheostat type controls the various speeds of the vehicle, and is provided with five positions, the last two giving, respectively, twelve and fifteen miles an hour. The brake is equipped with the latest form of wooden block mechanical brake arranged upon the differential, and in addition there is an electric brake operated directly from the control. In connection with the mechanical brake lever, which is operated by the foot, there is shown a unique form of cut out, which at the same time locks the brake lever when it is set. This cut out consists of a level propecting rearward from the box dash, and having on its end adjacent to the brake pedal a series of notches for engaging and holding said lever in any desired position when the brakes are applied. This lever has a movement in a horizontal plane, and when thrown into position to engage the brake pedal opens a switch located in the box dash and thereby opens the circuit between the batteries and the controller. This is an essentially new feature in electric vehicle construction, and excludes any possibility of moving the control and turning on the current while the brake is locked. The wheel base is unusually long, 65 inches, and the weight 1,000 pounds. A side steering lever is also used. The side spring suspension of the body with one of its members pivoted to the body is really most unique, and, while giving easy riding qualities, provides absolute flexibility of the axle members with relation to the vehicle body, at the same time removing all severe and dangerous strains.

In addition to these vehicles there are also exhibited two electric broughams. The extension front pattern provides accommodation for four passengers, while the straight front pattern accommodates two. The forward seat of the extension pattern is hinged, and when not in use may be dropped, leaving a clear space. Both these vehicles are richly appointed, and are fitted with every convenience and appointed in a most approved manner. Large wheels are used on these vehicles, which contribute greatly to easy riding, durability and economy of operation. The controller is on the operator's left, and the vehicles are steered by a wheel. Both foot operated, regular and emergency brakes and a foot operated safety cut off switch are conveniently located to be under the control of the driver. In both cases the underslung battery is used, and comprise forty-four Exide cells with a capacity of 140 ampere hours at a thirty-five amperes race discharge, giving forty miles travel on one charge. In these vehicles the reach members of the under running gear frame are still maintained.

Little need be said about the Columbia electric hansom, the Columbia electric rear boot coupe, the Columbia electric cabriolet, the victoria, the tonneau, the special service wagon and the Columbia electric runabout known as Mark XXXI. These vehicles have all been shown, and are too widely known to require comment.

The Electric Vehicle Co.'s Columbia electric truck is no small contribution to the growing family of commercial vehicles. It has a load capacity of 5,000 pounds, and is provided with underslung batteries, all contacts for which are automatically made as the battery is raised into position and engages the hangers in the battery compartment. Perhaps the most important feature of this truck is a novel three point body suspension, which relieves the frame from all warping strains. No reach members are used, and the forward end of the vehicle is supported upon the transverse spring member of a half platform spring through a pivot.. The forward ends of the elliptic side members of the platform spring are shackelled to the forward end of the vehicle, and these half elliptic springs, of course, rest directly upon the axle. A double motor drive is used, giving independent drive to each of the rear wheels, and two very powerful brakes are provided, each foot operated and one acting upon the outside and the other upon the inside of the driving gear. The control is of the general type known as the "vertical controller," and follows closely upon the lines of the regular street railroad car controller. This provides four speeds ahead, one reverse and an electric brake. In addition to the main operating means of the controller, there is a small reverse lever, which upon removal locks the main controller drum in the "off" position. The Collinge type of axles are used, with wooden wheels 36 inches in diameter and 4-inch solid tires. Forty-two cells of Exide battery, arranged in a single tray, complete the equipment.

ELECTRIC VEHICLE COMPANY'S TRUCK.

Baker Motor Vehicle Co., of Cleveland, Ohio—This exhibit is shown by the American Automobile Storage Co., the New York representatives. As usual, it attracted more than ordinary attention, the new models, including the Newport and physician's chapelette, being strikingly attractive.

The same elegance in design which has brought the Baker car to the front is adhered to in the new models, and, while the general lines of construction have not been materially changed, the body designs have been made, if possible, more eye pleasing than in former models. The tubular running gear of the flexible type is used, with wire wheels mounted upon Baker ball bearings. The batteries are in each instance carried under the seat, giving free body space in the rear boots, and the motor is hung directly below the centre of the body, driving through a chain and differential gear on the rear axle. The vehicles are regularly supplied with twelve cells of the Gould battery. A special controller of very compact and simple construction is used, giving three speeds forward and reverse. This controller is absolutely non-arcing, and has no fixed step by step positions, but may be used by a novice with impunity. To secure a reverse a heel press is provided in the heelboard, and an interlock connects this press with the main controller drum to prevent throwing the controller from a go ahead to a reverse position without first bringing it to the zero, or cut off, point. A motor of most improved type, equipped with ball bearings throughout, is hung directly under the body, and its main shaft is provided with a brake drum, the brake band of which is controlled by a backward pull on the controller lever. In addition to this brake, a powerful foot operated brake is arranged on the drum of the differential. It is needless to say that the Baker carriages are distinctly in a class by themselves, and are the lightest vehicles combining necessary strength and durability in the show. The body designs and the color effects are up to date, and the finish is truly of the highest type.

The Studebaker Mfg. Co., South Bend, Ind., who exhibit for the first time, display four electric vehicles, two runabouts and two stanhopes.

One of the attractive features of these machines, from a mechanical standpoint, is the tubular frame, supported upon half elliptical springs over the front axle and full elliptical springs over the rear axle. One

Digitized by Google

of the latter springs is pivoted to the tubular frame, thus giving all the necessary and desired flexibility and freedom of movement to the axle members. All battery weights are supported directly upon this frame, or gear, and the motor is also hung from the frame midway between the axles, and drives through chain and sprocket transmission to the rear axle. The batteries, twenty-four cells, which are of the Exide type, are carried in the rear boot and supported directly upon the tubular frame. The controller, which is of the series parallel type, gives four speeds forward and four reverse. The reverse is secured by a heelpress arranged in the heelboard, and an interlock is provided between the heelpress and the main controller drum, making it impossible to throw the controller from a go-ahead position to the reverse without first cutting off the current. Two brakes are provided, the main brake operating upon drums carried upon the rear axle, while the emergency brake acts directly upon the motor shaft. Both of these are controlled by foot pedals. A side steering lever is used, and the operator sits on the left of the vehicle. The motor is of the Westinghouse type, and gives the usual high efficiency of this type of machine. A novel cut out switch having a removable handle, and adapted to be thrown into three positions, gives absolute control of both the charging circuit between the charging plug and battery and the circuit between the battery and motors. The arrangement is such that when the charging circuit is thrown in the circuit between the battery and motors is absolutely cut out, thus permitting an examination of the motors at any time, even while the battery is on charge, without endangering the workman. By supporting the weights above the tubular frame and above the spring suspension it is possible to maintain high rates of speed over rough roads. The usual elegance of design in every appointment of the Studebaker cars is quite up to the standard of the company which has so long been maintained in their well known carriages.

The International Motor Car Co., of Indianapolis, Ind., display some eleven vehicles, gasolene, steam and electric. The electrics, the Waverley, include several new body designs, viz., the Stanhope, the Chelsea, the light, uncovered delivery wagon, the tonneau touring car and a surrey.

Among the special features of the Waverley vehicles is their light yet strong construction. Wood wheels have been adopted throughout, and the bodies are in every case supported on full elliptical springs over the rear axle, with a cross spring pivoted to the forward spring shackles and forming an auxiliary support for the batteries, which are located in every instance, except in the case of the delivery wagon and tonneau, in the rear booth. In the two latter cases the underslung battery suspension is used, giving free body space and low weights. Both double motor and single motor drives are used, depending upon the weight of the vehicle. A unique form of suspension is shown in the double motor drive. A trussed rear axle of the divided type has supported upon it and upon an auxiliary frame two motors, each driving to one of the independent sections of the rear axle through "herringbone" gears, giving a most efficient and absolutely noiseless drive. Of the new types shown for the first time at this show the tonneau and Stanhope are perhaps the most attractive. A very simple form of controller is used in all these vehicles, and gives three speeds forward and a reverse. A separate reversing switch controlled by the lever projecting through the heelboard is convenient to the left hand of the operator. A backward pull upon the main controller handle applies an electric brake, which becomes more or less powerful, dependent upon the speed of the vehicle. The controllers in every case have contacts of the knife switch pattern. All of the Waverley vehicles of this exhibit demonstrate the advantages of the reachless running gear. By the rear method of spring suspension above described and the use of an iron reinforce wheel in the body all reaches are dispensed with. The Stanhope body is of the recognized Stanhope type, with swell panels and a gracefully curved box dash. The wheel base is unusually long, being 72 inches, giving easy riding qualities. In addition to the electric brake there are two others, one acting upon the armature shaft and the other, including two expanding brakes, acting upon the interior of drums carried upon the rear wheels. The vehicle design, and in fact every appointment of these vehicles, is all that could

TWO OF THE NATIONAL ELECTRICS.

be desired, and is quite up to the standard formerly maintained by the company. Exide and Gould batteries are used, and are carried in trays for convenience of handling. In the larger vehicles forty cells are used, while in the lighter machines twenty-four cells are used, giving, respectively, eighty and forty-eight volts.

Ajax Motor Vehicle Co., New York, exhibited two electric vehicles, one a light runabout with top, and one without top. The top is made detachable, and may be easily put in place. Wire wheels are used with ball bearings throughout, and in fact ball bearings are used on the motor bearings. The tubular running gear is used, with two reach members extending between trussed axles pivoted at opposite corners to give the desired flexibility to the axle members. Two brakes are used, one controlled by the controller handle and operating directly on the armature shaft; the other foot operated and acting directly on the drum of the differential. For cut out lock a Yale lock is used, which absolutely locks the vehicle. The controller is of a special design, having unique features. It is of the rheostat type, and the first contact is made through abutting carbon contact, which absolutely precludes all arcing. The succeeding contacts are made by two sliding members of the knife switch pattern, engaging with co-operating spring contact members. These cut out the resistance in sections, and finally cut out the shunt, giving the high speed, which is fifteen miles an hour. All parts of the controller are mounted on a slate or marble base and thoroughly insulated with mica. It is a most perfect mechanical and electrical structure in every respect. The method of securing the reverse is also worthy of more than passing remark. It consists of a solonoid having two magnetic members arranged within it and controlled by a circuit manipulated by a press button in the controller handle. As the press button closes the circuit through the solonoid, the two sections within the solonoid adhere and form a direct connection with the reversing switch. The controller may now be moved forward through the succeeding reversing speeds, and upon being brought back to the cut off, or zero, position mechanically throws out the reversing switch. This is really the most unique controller in the show. The motor is below the centre of the body, and swings between buffers, which act with a cushioning effect to prevent jar upon steering and stopping. Batteries in each instance are carried under the seat, and consist of twelve cells of either Gould or Exide, as preferred. Altogether this is a very attractive vehicle, showing as unique features in the way of control as anything in the show. The control is as simple as possible, and may be operated even by a novice.

The Vehicle Equipment Company, Brooklyn, N. Y., represented by the Rainier Co., exhibited the heaviest vehicles of the electric type in the show. They comprised eleven vehicles of the following types: The hansom, coupe brougham and extension brougham, rear boot victoria, three light delivery wagons of 1,000 and 2,000 pounds capacity, two five ton trucks, one of which is a brewery design for fifty half barrels; the New York Telephone truck, of five tons capacity, with an electric hoist utilized for hauling cables through conduits, and an ambulance. Among the newest designs and those first exhibited at this year's show is the hansom and victoria, both models of perfection as to every appointment. The marked feature of all the vehicles shown is the running gear, which is of the pedestal type, with full elliptical springs, both fore and aft. The yokes inclose the sliding blocks of the axle members and give a universal movement with all desired flexibility to said members. The battery, as far as possible, is of the underslung type, cradled, and arranged in sections, each section comprising a separate tray, making a very convenient means of removing the several battery sections, and entirely doing away with the necessity of hydaulic lifts. The batteries are introduced from the side of the compartments. The double motor drive is used, the motors being of the general electric type pivotally hung on the rear axle and driving directly to the spur gears of the rear wheels. Expansion brakes are used on the rear drums of the wheel. The controller is of standard general electric type, of the series parallel order, giving four speeds ahead and two reverse, with an interlock between the reverse lever and main controller drum. The Equipment Company still maintains the general design of horse drawn vehicles as far as possible. While this company primarily turned its attention to heavy trucks and vehicles, they are now departing in so far as they are making comparatively light victorias of magnificent de-

Digitized by Google

sign. The whole design of the vehicles bends toward simplicity, strength and durability.

Centaur Motor Vehicle Co., Buffalo, N. Y., shows an electric runabout having the usual piano box straight front dash type of body, carried on full elliptic springs in the rear and half elliptic springs in the front, which are attached to the body with body irons. Wood rim, wire spoke wheels are furnished. A ball bearing Westinghouse motor is used. The motor winding is arranged in two halves, allowing of a four speed series parallel system of control and reducing paralleling of the batteries to a minimum. The speed reduction is through the medium of a brass shrouded, rawhide pinion, meshing with bronze gear on a ball bearing countershaft in a dustproof case. Power is transmitted to the rear axle by roller chain, the pull on which is resisted by adjustable radius rods on either side. The battery consists of fourteen large capacity cells assembled in two trays for ease of handling. A new form of battery indicating instrument is the very ingenious device in which the complications of the ordinary ammeter are eliminated, but as the exhibitor was unable to give a description of it its detail cannot be here stated. Positive, double acting brakes are used, which, when idle, do not rest upon the brake drum. The controller is so arranged as to be interlocking at the point between forward and reverse, so as to avoid unintentional and sudden reversals of the motor. The cut out switch can be thrown either by foot or hand in case of a broken controller, handle or other accident. While the battery is being charged the motor and controller circuits are cut out so that any interference with the motor, controller or wiring can have no damaging effect.

National Motor Vehicle Co., Indianapolis, Ind., exhibited five vehicles, including runabout, stanhope and a park trap, using thirty-two cell Weston storage battery and sixty-four volt motor. The runabouts are equipped with 2½ horsepower motors of special construction. A reachless gear is used throughout, and the bodies are supported on full elliptic springs over the rear axle and new pattern C springs in front. The batteries are carried in the rear boot and under the seat. The motor in each instance is mounted upon the rear axle and drives direct to the differential gear. The controller is of the series parallel type, giving four speeds forward and four reverse by compressing a button on the end of the controller lever. This reverse is only operative when the controller is in the off position, thus preventing throwing the controller from the forward running position into the reverse position without first cutting off the main motor circuit. The special feature of this exhibit is a runabout which is equipped with thirty-six Weston storage battery cells, which, it is claimed, have given a run of 118 miles on one charge without destruction or injury to the wagon. Two brakes are provided, both pedal operated, one acting on the motor shaft, and the other acts upon the drums of the rear wheel hubs.

SUPERSTITION DEFIED.

One of the most unique vehicles of the show is the Neftel combination gasolene and electric carriage, shown in the booth of the Vehicle Equipment Co. This vehicle from its novelty invited unusual attention. Upon a complete chassis of heavy construction and at the forward end is mounted a two cylinder 10 horsepower gasolene engine direct connected to a specially wound dynamo, the two combined forming a generating unit which is capable of keeping the batteries fully charged at all times. Provision is made for easily cutting out the generating unit if desired, and just as easily starting the gas engine by the manipulation of a single switch, which automatically and simultaneously controls the oil feed, the ignition and generator controlling parts of the engine. An underslung battery of forty-four cells of the Exide type is used for furnishing the source of power for two motors driven directly upon the rear wheels through spur gear transmission. A series parallel type of controller is used, giving four speeds forward and two reverse. The entire engine is little, if any, larger than the conventional type of tonneau machine, and, having its generating plant always with it, needs no local charging stations.

The Electric Storage Battery Co. of Philadelphia, makers of the almost universally adopted Exide cell, have an attractive exhibit adjacent to the space occupied by the Electric Vehicle Co., the largest electric vehicle exhibit in the show. The Exide cell has become so popular and is so well known to the general trade as to need no recommendation or detailed description. It is used by the majority of electric vehicle constructors. The exhibit is tastily arranged and designed with special reference to the instruction of those not familiar with storage battery cells. Numerous plates of different styles and type give at a glance a good idea of the construction employed by the company. A new soft rubber plug is now used on the cells, which is much handier and does away with the old style hard rubber screw plug. It prevents all acid slop. Chloride accumulators also are shown.

The much talked of Edison storage battery, exhibited in Section 50, naturally attracted much attention. While the Edison battery does not appear in the vehicle product of the show, the display at the Edison booth was designed to show the several details of construction. The cells are made up of alternate plates of steel, two and one-half thousands of an inch thick, provided with small rectangular pockets, arranged to receive the metallic oxides of iron and nickle. The oxides are introduced in the rectangular openings in powdered form, and are closed in by perforated cups forced into the plate by hydraulic pressure. The complete cells are three and one-half by five and one-half by fourteen inches, and weigh about fourteen pounds, a capacity of two hundred Watt-hours is claimed, giving 3¾ horsepower, per hour. The several cells are sealed with special valves, which prevent the solution of distilled water and potash from slopping. The delay in bringing out the Edison battery has naturally caused many doubts regarding its commercial practibility.

The Westinghouse Electric & Mfg. Co., Pittsburg, Pa.—A surprise was in store for the automobile trade at this show when that most conservative firm, the Westinghouse Electric & Mfg. Co. opened its exhibit in Space K, in the restaurant, with a most complete line of electrical apparatus for electrically propelled vehicles. Their exhibit includes motors, controllers, battery indicating meters, cut-out switches, charging receptacles, charging plugs and connectors, motor generating sets, complete individual switchboards for charging vehicles, and charging outfits for stations.

This is the first appearance of the Westinghouse Electric & Mfg. Co. in the automobile field, and it is safe to say that the future of the electric vehicle will be much stimulated and improved by the wonderful mechanical facilities and unusual engineering ability of the concern. This will undoubtedly be more marked as this branch of the company's enormous interests is under the immediate influence and experienced guiding hand of Lieutenant Harold H. Eames. Lieutenant Eames, as is well known, is a pioneer in the automobile industry, and has been most closely allied with it from the beginning of the development of the electrically propelled vehicle. The Westinghouse Co. have standardized all parts, and it is safe to say that vehicles using their equipment will be surpassed by none. Every detail has been carefully worked out, and all of their apparatus appears to partake of the reliable and substantial character which marks this company's product in general.

American Coil Co., West Somerville, Mass—Electrical supplies. New: An automatic spark coil that gives a vibrator spark and automatically changes to a single make and break spark. The Little Wonder Dynamo is one with a system of storage in its base which does away with batteries for starting purposes. The American Pocket Ammeter, a reliable instrument for the pocket.

RESULT OF THE DEFIANCE.

Steam

The steam vehicle has not stood still. New impetus has been given to it by the adoption of marked improvements both in the style of vehicles and the more finished details of their construction.

The number of exhibitors is perhaps not as large heretofore , and the gross number of vehicles exhibited has declined somewhat. There are some eleven exhibitors, showing a gross number of thirty-three vehicles, including twenty-three carriages, four wagons, five tonneaus and a stage. It is safe to predict that the steam vehicle will become more popular as the kerosene burners are perfected, and gasolene as a fuel is discarded. The makers undoubtedly recognize this as is shown by its adoption by the Mobile Co. of America and its contemplated use by the Locomobile Co., and possibly others. The present product is much more perfect than heretofore. Details of engine construction and controlling systems have been carefully worked out in a most mechanical manner, and conform to the best steam practice. All delicate parts are being made more accessible.

One of the striking features of the show, and one which will go far toward maintaining the demand for steam vehicles in the future, is the adoption by several of the manufacturers, including Grout Brothers, the White Sewing Machine Company, and the Locomobile Company, of a complete chassis, giving a touring car simulating in appearance the standard type of gasolene cars.

By using the complete chassis it is possible to materially increase the strength of the parts, and without spoiling the aesthetic design of the cars, to provide in proper and accessible positions the latest devices of the steam engineering art. These secure elastic control and great economy in operation, necessarily giving increased touring capacity on a given charge of fuel and water. The condenser and the compound engine are materially adding to the efficiency of the steam car, and the semi-flash boiler with its quick steaming capacity is in vogue.

Steam operated air pressure and water pumps with automatic control used in conjunction with hand operated pumps are being arranged in most accessible positions; and in one case in particular, that of the Mobile Company of America, are of particularly unique and finished design.

To summarize, it might be said briefly that wheel bases are increasing in length. Wooden wheels, with heavier construction throughout, are naturally following; steam economy is being looked after, and the general design of steam cars in conforming more and more closely to the gasolene type, which at present appeals so strongly to the public.

Even the lighter runabouts have their bodies provided with box dashes for lockers or enclosing an extra seat.

The White Sewing Machine Co., Cleveland, Ohio, unquestionably the banner bearers in the steam class, exhibited, of course, their Stanhopes and delivery wagons, but they were dwarfed in interest by the tonneau bodied, bonnet fronted touring cars, one finished in white and the other in black, not to mention those used out of doors for demonstrating purposes. The cars bore out the illustrations and specifications that had preceded them.

At the forward end of the hood, or bonnet, in place of the ordinary cooling coil of the gasolene machine there is arranged a condenser of ample capacity to take care of the exhaust steam, giving the greatest possible economy in water consumption. The water tanks, having a capacity of fourteen gallons, give a hundred-mile run. In place of the simple engine of last year, there is employed a compound engine, with a high and low pressure cylinder, developing 10 horsepower. This engine is hung directly on the frame of the car, and is thoroughly inclosed and run in oiltight casing, splash lubrication being used. The main shaft drives directly through a universal coupling to the differential upon the rear axle, and just in advance of this universal coupling is a drum on the engine shaft, arranged to be acted upon by a brake band controlled by a foot pedal. In addition there are two very powerful expanding brakes, acting directly upon the interior of drums upon the two rear wheels. These two brakes are controlled by a lever, at the right of the operator, and just outside a second lever, which controls the reverse for the engine, which is accomplished through change of the links altering the lead on the valves of the engine. A foot pedal is also provided for throwing the live steam directly into both cyclinders, thus making a direct acting, simple engine. The engine works either as a compound or simple engine. The exhaust steam is carried through the condenser, and a positively driven pump carries this condensed water back through an oil separator in which the oil is separated from the water. The water, of course, is carried back to the main tank. On the same piston rod with this pump is a second pump, actuated by the same means, and comprises the main pump for forcing water from the tank to the boiler. At the extreme front of the engine there is a pivotedly supported air pump, the position of which may be varied by depressing a pedal. As it is thrown into an upright position the hooked end of its piston is engaged by a pin projecting from the crosshead of the engine through the engine casing, and thus the air pump, for giving the necessary pressure upon the gasolene tank, may be thrown in or out at will, and a sufficient pressure easily maintained. Wheel steering is used, and is of the well known worm and segment type. Extending through the upright shaft of the steering pillar is a rod, bearing at its lower end a short lever which controls the throttle valve of the engine, and is provided at its upper end with a small hand wheel concentric with the main steering wheel. In addition to the positively operated pumps for the water and air, there are provided, just in front of the heelboard, two hand operated pumps, one for air and the other for water. A unique arrangement is shown in connection with the tonneau bodies for thoroughly venetilating the boiler compartment and carrying off all odors and excessive heat. A tube is arranged on each side of the vehicle body, and really inclosed by the fenders, which, at or near the centres, connect with the interior of the body and the boiler compartment and draws off all excessive heat. In every case aluminum bodies are used, and the water tank conforms to the outline of the dash. It is directly behind the bonnet. The special type of White boiler is used, giving unusual steaming qualities.

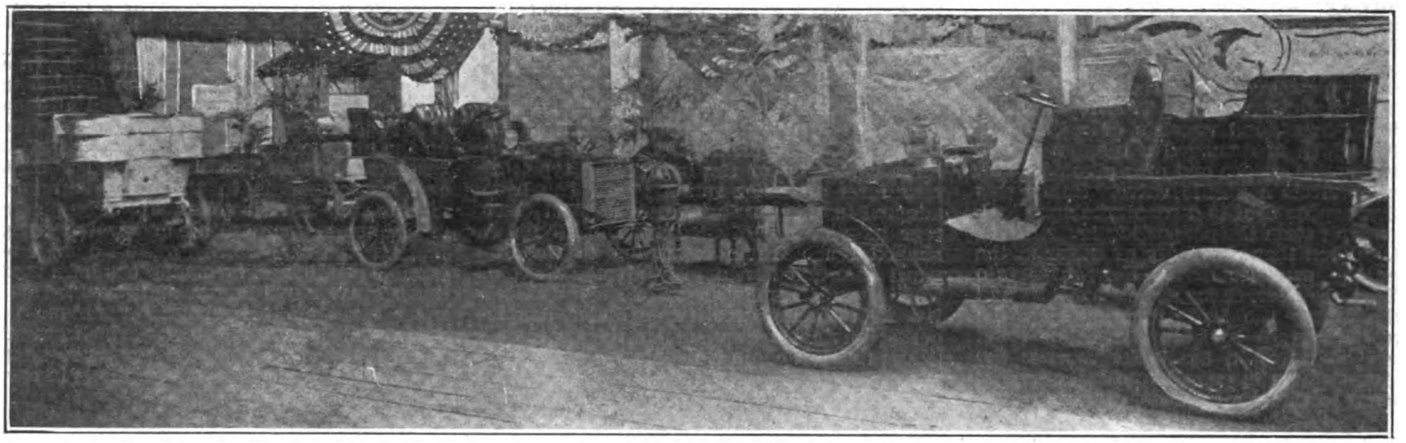
The weight of the car is 1,600 pounds, and is adapted for speeds up to thirty-five miles an hour. To give added strength artillery wheels are used throughout, 30-inch diameter, and are provided with 4-inch double tube detachable tires. The White possesses a compound engine, the only one exhibited, and, it is believed, used in an automobile.

Mobile Co. of America, Tarrytown, N. Y., has the largest display of steam vehicles in the show. The general design of the Mobile products has been materially changed, and several new models, including the victoria, the coupe and the merchants' delivery wagon, have been added. Among the old models are the touring carriage, the wagonette, light delivery, light surrey, heavy surrey, runabout and dos-a-dos. The general arrangement of the mechanism is the same or practically so for all of these cars. The flexible tubular running gear is still maintained, with the body springs supported over it, and a chain drive is used in every case from the engine to the differential on the rear axle. The newest features of the Mobile is a kerosene burner in connection with their regular tubular boiler. In this burner the kerosene is fed through a coil lying directly over the centre of the burner and offering a large heating surface. The oil is here vaporized and passed into the mixing tubes at the bottom of the burner pan. The burner base, or pan, is made up of a chamber having on its upper surface a series of raised nipples perforated at their upper ends, and intermediate of these several nipples there are air tubes, which pass through the upper and lower plates of the burner chamber. This construction insures proper combustion at the nipple burners, and at the same time supplies a sufficient amount of air at a point which insures the upper plate of the burner chamber against excessive heat. The heat coil or vaporizer, of course, must first be heated by a hand torch until the kerosene has been vaporized to a sufficient degree to be used in the auxiliary burner torch. It is not claimed that this burner will run more than twenty or thirty hours without accumulating a considerable quantity of carbonaceous substance, but a direct steam connection is provided between the boiler and the burner which provides a means for blowing out the burner and dissipating all carbonaceous deposits. The engine, as heretofore, is of the two cylinder, double acting type and hung just under the seat. The capacity of the fuel tanks and water tank has been increased. The two fuel tanks are located directly over the footboard, while the water tank is carried in the rear bonnet back of and around the sides of the boiler. A diaphragm operated needle valve, controlled by the pressure in the boiler, deter-

Digitized by Google

mines the amount of fuel which is passed to the burner. The main water pump is constantly operated from the crosshead of the engine, and when the water rises to a predetermined point in the boiler an automatic regulator permits of free circulation of water back to the water tank. This regulator is of novel form, and consists of a chamber within which is arranged a tubular copper float mounted on the end of a pivoted lever, which controls a needle valve. Below this tubular copper float is a counterbalance ball, also acting upon the supporting lever of the float. When there is plenty of water in the boiler the pressure drives the water into the float chamber, filling the copper float and overbalancing the ball, thus opening the valve or by-pass back to the water tank. When the water in the boiler reaches the low level steam is passed into the chamber adjacent to the tubular float, evaporates the water contained therein and permits the counterbalance ball to close the by-pass, thus forcing the water directly into the boiler. A device of similar construction is arranged to provide an alarm by showing a jet of steam at the side and front of the vehicle when the low water limit is reached. Another very novel feature on these machines is the combined steam and hand operated water and air pumps. Both pumps together with the steam operating means are arranged in a single casing on the back of the dash and the main shaft, which is driven by the steam engine section of the pump, is extended across the vehicle and provided with a crank, which may be thrown into engagement with the shaft when it is necessary to use the air and water pumps without the steam. Ordinarily the turning of one of several small cocks will thrown into commission either the steam operated air section or the steam operated water section of the pump, or both. Wherever possible pipe fittings have been dispensed with and annealed tubes are used in lieu thereof.

The International Motor Car Co., Toledo, Ohio, exhibited one Toledo steam carriage of the runabout type and four gasolene machines of the tonneau type, comprising three distinct models, varying in horsepower from 12 to 24, and have a seating capacity of five persons. The Toledo steam car is of a distinctively new type with this company, having the general lines of the gasolene machine and a lowered bonnet inclosing the water tank, and having at its front end a large condenser of the honeycomb type. A new form of under running gear has been adopted in this carriage, comprising a truss rear axle of the divided type, with an A shaped reach frame extending to the forward axle and horizontally pivoted thereto. This gives a running gear of great flexibility. A 7½ horsepower, two-cylinder, double-acting engine is hung under the seat, and drives through chain transmission to the balance gear of the rear axle. The engine is hung, as heretofore, from a large ball joint, giving universal movement for flexibility and at the same time providing the main steam inlet. A new device on the engine is a side lever controller for the link throw; this may be used very effectively to economize in steam by varying the stroke of the valves, which are of the piston type. The side steering lever has been adopted in place of the combined pump and steering lever heretofore used. The exhaust steam from the engine is carried directly to and through an oil operator, provided with a relief valve, which automatically opens and takes care of all excessive back pressures. From the oil separator the steam is carried through the condenser, and finally back to the main water tank. The vacuum pump, constantly operated from the crosshead of the engine, circulates this condensed water. The boiler is of the improved Morgan type, and gives a semi-flash effect. All pressure gauges are provided with electric illuminators.

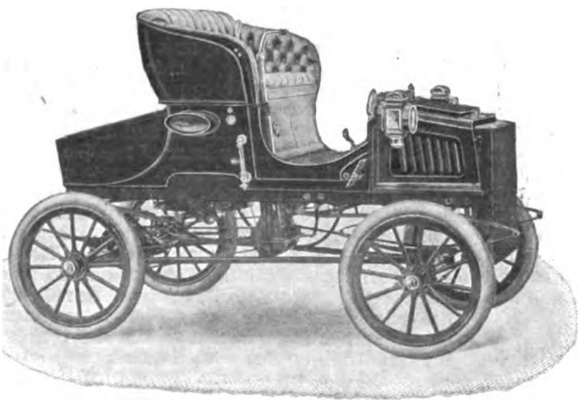


Locomobile Co. of America, Bridgeport, Conn., show these new steam models: The box front runabout, the light delivery wagon, improved Stanhope B, with wooden wheels and wheel steering device, and a steam tonneau, which is shown only in photograph. This could not be finished in time for the show. In addition a number of the older models of the company are exhibited. In all the steam machines shown the flexible under running gear is still maintained although it is proposed to use a complete chassis much on the order of the gasolene type and of the reachless form. The most noted changes and improvements in the steam carriages of this year are the following: The placing of the steam operated air and water pumps just below the footboard and in a most accessible position. The engine has been made much heavier and larger, and provided with roller bearings throughout. A unique improvement is a ratchet device which permits tightening the packings on the valve stems and pistons even while the engine is in operation.

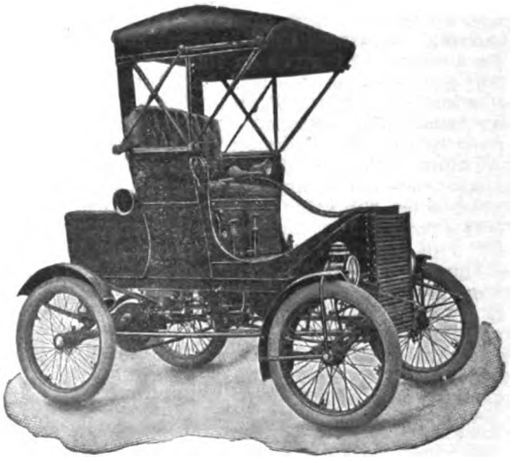
Other notable features of this year's cars is the interconnection between the main lubricating cup and the throttle lever, which insures turning the oil on and off as the machine is starting or stopped, and the dispensing with the use of the torch for firing up. By opening a small by-pass into a small perforated tube a supply of oil can be secured for heating the vaporizer tube, which is perforated and has fins, giving a very large heating surface. This tube may be heated up by merely applying a match to the little burner casing, and when once the vaporizer tube is heated a full fire may be turned on at the main burner for the boiler. The method of control is the same as heretofore used, and with the exception of the small vehicles an irreversible wheel steer has been adopted in place of the side steering lever. The old form of spur differential gear with round axles has now been displaced by a style of improved bevel gear differential, the gear of which is mounted on roller bearings united to the drive members through square ended axles.

Stearns Steam Carriage Co., of Syracuse, N. Y., exhibit four steam vehicles, two tour-

Digitized by Google



THE WHITE EXHIBIT.



ing cars, a Dos-a-dos trap and a Victoria top Stanhope. The remarkable features of under construction of the Stearns vehicle are the hickory reach members, extending between the front and rear axle members and secured to them. This construction gives a flexibility to frame and at the same time gives a side spring effect. The same general design, except in minor detail is still adhered to by the Stearns Co., and certainly these vehicles have met with great success. The construction of these vehicles is slightly heavier than the corresponding types of other makers. Double cylinder engines are used of special design, hung directly over the seat and driving to the balance gear on the rear axle and varying in horse power from 8 to 12 for the different cars. The boiler capacity has been increased a little over last year's cars, and a pilot light is used for steaming up. A sight feed lubricator is now used for the main engine bearings, which is under forced feed, induced by steam pressure conducted to the oil chamber through a shunt tube from the boiler. The brakes, which are arranged upon drums upon the rear wheels, are of the expanding type, and completely inclosed against the action of mud and water. The steam is thoroughly superheated, thus dispensing with the use of a condenser. Fires are automatically controlled, dependent upon the pressure in the boilers. The water pump, actuated directly from the crosshead of the engine, is coupled up with a by pass which permits pumping directly back to the tank and circulating the water when a sufficient amount has been secured in the boiler. A low water alarm is provided.

The Meteor Engineering Co., Reading, Pa., uncovered a surprise in their steam tonneau, with aluminum finish and blue and gold stripping and brass trimmings. The frame is of angle iron, with four full elliptic springs. Artillery wood wheels, with 30x3½ inch detachable tires are used. Both axles are square and solid and are connected by tubular swivelled reaches from the centre of the front axles to the shoulder or collars of the rear axles. The boiler is of the fire tube style, with 713 half-inch copper tubes located in front under a bonnet. A 20-inch three-compartment burner is used, fed by a vaporizer first filled with alcohol, which is ignited, and after the gasolene is sufficiently vaporized in the auxiliary coil the auxiliary valve is shut off, feeding back then through the main nozzle. Forty-five gallons of water and 13¾ gallons of gasolene are carried. The gasolene is fed by steam and air pressure. Water is fed to the boiler by crosshead steam and hand pumps. The forced draft also is used. All of the valves are within easy reach of the operator, being on the brass covered dashboard in front of him. The engine is of a two-cylinder 10 horsepower slide valve link motion, placed horizontally under the footboard, where it is easy of access, and is covered by a casing to protect it from road dirt and mud. The drive is by a chain through a compensating countershaft, and from there by two chains to the rear driving wheels. The chains are adjusted by two radius adjusting rods, and there are also two similar rods on the engine. The countershaft is hung to the centre of the frame by a rocker plate, and is not attached by either end of the frame or the body, thus taking the strain off the body. On the wheel steering the throttle is operated by a small brass wheel, which works through the centre of the steering posts. The whole construction in its external appearance resembles the gasolene vehicle. Two other models of steam carriages are shown, there being no change in them since last year.

The International Fire Engine Co., New York, exhibit one of the novelties of the show in a steam propelled fire engine built by La France Fire Engine Co. This vehicle has an unusually heavy underrunning gear, consisting of channel irons pivoted to the forward and rear axles. The main boiler, of the fire tube type, is located at the forward end under the driver's seat, and supplies steam for two separate engines, which give an independent drive for each of the rear wheels. Each of these engines is of the double cylinder, double acting type, and both are controlled by a single throttle lever operated from the centre of the seat. Either engine may be cut out of operation if required. Wheel steering is used, and consists of a worm with traverse block or nut, operating directly through a bell crank upon the steering wheel connections. The vehicle carries at either side a chemical tank of thirty-five gallons capacity and 150 feet of chemical hose. It also has body space for 1,000 feet of 2½-inch hose. The gasolene and air tanks are automatically supplied with pressure from directly operated

TOLEDO.

WHITE.

Digitized by Google

pumps. Provision is made for keeping up steam in the boiler by connecting with an ordinary illuminating gas supply, with an automatic cut off, which breaks the connection and frees the vehicle as it starts on a run, the fire being subsequently maintained by gasolene burner of special construction. The speed of the vehicle is twenty miles an hour.

The Prescott Automobile Mfg. Co., New York, exhibit their famous steam car which made such a great record in all the tests of last year; also an entirely new steam wagon. This has a tubular running gear with wooden reach rods, wire wheels, specially constructed rear axles—that is, instead of the usual arch, it is trussed underneath. Four full elliptical springs are used. The body has a combination drop seat front. The boiler is a dry plate Tonquin, with superheating coils. The burner is a special burner, embracing several novel features, including a pilot light, which is part of the main burner, fed by an independent mixing tube. This pilot light will maintain full steam pressure for an indefinite period. With this boiler and burner full pressure is maintained under any and all conditions. The engine is a Mason 2½x3½ inches of the latest type. Lubrication is by automatic forced feed. It has a capacity of ten gallons of gasolene fed under air pressure; thirty-two gallons of water, and is equipped with a steam water lift. A single charge of water will run the car forty-five miles under normal conditions. The gasolene supply is sufficient for upward of 100 miles. It has a crosshead water pump, a Marsh steam water pump and a hand lever pump. It is also provided with a Marsh steam air pump and the usual hand pump. The common method of reversing by a hand lever is dispensed with, the reversing being done by a foot pedal, and the fire is controlled by a hand ratchet valve from the seat. Certainly a strong, substantial, well finished steam car.

The Hoffman Automobile & Mfg. Co., Cleveland, Ohio, display a steam runabout. It is of the usual type, with tubular running gear and with an extra folding seat in front. A flash steam system of generating is used, which obviates the need of a water glass, fusible plugs, water alarms or anything of like character, there being no water level to maintain.

Tires

All told, the tire changes seen at the show are of remarkable interest. The number of them leaves no doubt about there having been unusual activity among the makers during the past year, and the character of them marks the emphatic tendency toward the use of double tube detachable tires that has set in. At every space occupied by one of the makers of recognized standard goods was to be found something new, and in some instances the new things marked a radical departure in the firm's product, or a truly novel invention. All were agreed that the demand for double tube tires is heavy, while that for single tubes is almost nil.

In tire making the most remarkable achievement in recent years is that which was announced and exhibited at the show by the Diamond Rubber Co., at spaces 57-58. The non-blooming tire produced by this concern is a distinct and radical departure. The blooming out through the tire of the sulphur in the rubber to the surface has been the bête noir of all users of pneumatic tires ever since they were invented With the sulphur on, no cement made will make a plug in a hosepipe or a patch on an inner tube "stick tight," and every one who has tried it knows how difficult it is to remove the sulphur and make a good job of a repair.

The Diamond Rubber Co. has only just assumed the role of makers of double tube tires, but they have come to the front with something revolutionary. The "blooming" of the sulphur through the tire after the vulcanization is prevented by an ingenious process which removes the sulphur at a certain stage of manufacture, after it has served its purpose. With no sulphur "bloom" upon the inner tube, patches can be slapped on with little delay and the assurance that they will stay. This will be a boon to every automobilist, cyclist and driver using such tires, and should result in a boom in the business of this progressive firm of manufacturers.

This process promises a solution of the problem encountered by the rubber manufacturers in making satisfactory bulbs for motor car horns—bulbs that will not bloom and check. It is claimed by the Diamond people that non-blooming bulbs can be made if people are willing to pay the money for them.

The G. & J. shows a radically new step being taken on the part of its makers by the offering for the first time of a smooth tread tire. The corrugated tread will continue to be made, the new article being only an addition to the line.

The Fisk shows another instance of a firm that has decided to respond to the demand by adding a detachable tire to its line, and in this case it has been done in a remarkably clever and novel fashion, as shown by the description further on.

The Hartford Company has made a radical departure in the method of constructing its Dunlops, the International is offering a hose pipe with two vulcanized inner tubes, the Goodrich people show a new fastening clip, the Goodyear a new clincher of elliptical shape and so on through the list. Several comparatively new puncture proof tires are shown, a couple of them being on the freak order.

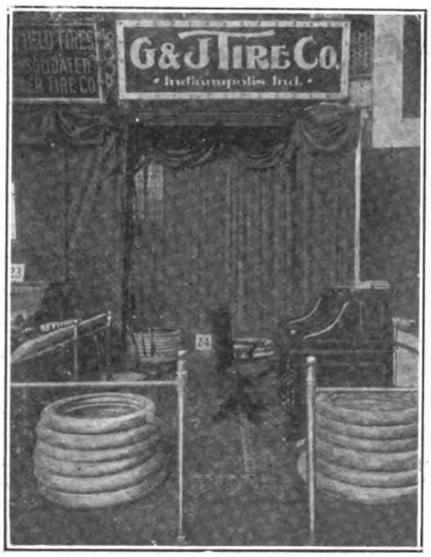
Hartford Rubber Works Co., Hartford, Conn.—Hartford single tube, Dunlop detachable and Turner solid tires. New: A radical departure in the construction of the Dunlop tire has been made by having the fabric vulcanized instead of put together by hand as heretofore. Red inner tubes as well as gray ones are now furnished in the automobile tires, and these are of six-ply rubber that can hardly be torn. In the endless, one-piece Turner tire a modification is shown by the greater rounding of the edges instead of leaving them nearly square. The demand for this tire, which is bolted to a flat rim surface with protecting side flanges, is increasing steadily. The universally known Hartfords have not been changed, presumably because of there being no way to improve them.

Diamond Rubber Co., Akron, Ohio—Diamond single and inner tube tires.

This exhibit is splendidly manned to attend to a volume of business in brisk style, as its sales managers from all the large cities are on hand to assist the New York manager, O. J. Woodward, who, with D. W. Nutter and G. J. Bradley, is in charge. Although in use for several months, the Diamond detachable is staged for the first time, and interest in it is heightened by the use of a new development in inner tubes, i. e., one that is absolutely non-blooming. The sulphur is all eliminated at a certain stage of the manufacture. There being no sulphur to bloom out, patches when put on have a firm seat. This is an absolute novelty.

Fisk Rubber Co., Chicopee Falls, Mass.—Fisk single and double tube tires. New: A double tube detachable tire that is fitted to a flat rim and held in place by a clamping ring that fits over a cone wedged shape bead on the bottom of the shoe. The ring not only clamps the bead together, but binds the tire to the rim so as to prevent creeping. The rubber head of the tire has a flat bottom that fits the rim, and when the clamps that hold the fastening ring are removed, the whole slips of without prying or tugging. A great virtue in this new tire is in the fact that the air chamber is entirely above the rim and positively cannot be pinched. In the well known Fisk single tube tire more rubber has been added to the tread and a layer of fabric has been taken out and replaced by a layer of rubber. The patented fabric of the Fisk company with its soft woof of cotton that prevents the threads of the fabric from cutting is used in all the tires.

The B. F. Goodrich Co., Akron, Ohio—Goodrich Clincher tires. New: A change has been made in the clips of this popular pneumatic by adding a new and simpler clip that works with a lock nut and washer and dispenses with the thumbscrew of the former clips. Both styles are still made, however, the "Lock washer" covered with leather and canvas and the "Thumbnut" not covered, being designed for tires that have no flaps.



Cummings Tire Manufacturing Co., New York City—Cummings Cinch Tire Protector. This is a new puncture proof strip for the tread of tires made of waterproofed leather with a base of heavy duck. It is cinched

Digitized by Google

around the tire by means of wires. It is claimed that it is resilient, yields better traction and prevents skidding.

International A & V Tire Co., Milltown, N. J.—The widely known A & V tires, both single and double tube.
New: An Endurance hosepipe tire of splendid workmanship and superior finishing, made with two vulcanized inner tubes.

The G. & J. Tire Co., Indianapolis, Ind.—G. & J. inner tube clincher tires. New: A tire with a smooth tread is shown as a new feature on this standard product and the whole line has been standardized to Goodrich and Diamond rims.

Standard Anti-Friction Co., N. Y. City—"Be-No-Ca" tires. New: The whole tire is novel, being built with a continuous series of solid rubber trusses on the inside. It is claimed that it is resilient and it certainly is non-collapsible, for it is not pneumatic.

Firestone Tire and Rubber Co., Akron, Ohio—Firestone solid rubber tires. New: A contract with the Interstate Transit Co. of St. Louis to equip all their automobiles running between St. Louis and East St. Louis with Firestone tires.

Consolidated Rubber Tire Co., N. Y. City—Kelly-Springfield tires. New: A traction tire of solid rubber, having a continuous central tread with alternating buttons or square blocks of rubber on opposite sides of it.

Metallic Rubber Tire Co., New York—The concern's pneumatic tire, with its tread studded with metal studs, is shown, and an object lesson given of its work on an inclined plane, intended to represent a slippery street.

Goodyear Tire and Rubber Co., Akron, Ohio—Goodyear clincher detachable tires. New: A clincher tire made with eliptically shaped shoe.

Accessories

This year the exhibit of supplies, parts, accessories and sundries has been dwarfed by comparison. The great number of complete cars throws a deep shadow over the supply stands, and yet there are three score of them, and when thoroughly investigated they are found to contain enough of interest to make a small show by themselves.

Outside of motors and tires, there are any quantity of new things and changes in gears, lamps, spark-plugs, batteries, coils, wheels, bearings, bells, lubricants and similar goods. The new things in the ignition line are of particular interest and indicative of a general striving toward improvement in this respect. Even in horns there is something new in the way of a thin sheet rubber covering for the mouth.

C. F. Splitdorf, New York City—Splitdorf spark coils. New: A vibrator on the outside of the coil box that has a thumbscrew adjustment for increasing or lowering the tension of the vibrator and so multiplying the vibrations and intensity of the spark. An attractive and instructive feature at this exhibit is a display of a giant spark from a giant Splitdorf coil. The spark demonstrates the perfectness of the Splitdorf insulating system by leaping in a lurid flash from one copper wire tip to the other across a gulf of eighteen inches. It could be made to jump twenty-five inches, but what is being done is sufficiently convincing for those who want a coil that absolutely does not leak. A complete coil for motor bicycles was shown on a 1903 "Indian." In the bicycle coil a new feature is an insulation of sheet rubber inside the outer tube of fibre. This gives perfect insulation from the frame of the machine without danger of there being any breakage as is the case when the casing is made of hard rubber. The features of silk covered wire, with silk paper and beeswax between each layer, peculiar to the Splitdorf coil, are retained and also the feature of having the primary and secondary coils and condenser all in one box, so that they are less affected by the vibrations of the vehicle.

The Weston-Mott Co., Utica, N. Y.—Artillery and wire wheels, front and rear axles. New: The superior character of this firm's work is so widely recognized that any addition to their output is assured of support. The firm now offers a new rear axle complete, in which there is one truss to resist the chain pull and another truss to sustain the load. Hyatt roller bearings are used and the compensating gear has no casing in which dirt can be hoarded. The axles are made for both the front and rear end of the body and are for their strength extremely light. A new pattern of artilery wheel is shown which is unusually light and very natty in appearance. It is made up with the standard crescent rim instead of the ordinary rim with flat base, lending strength as well as sightliness.

Charles E. Miller, New York City—Accessories and supplies. New: The Rutenber gasolene motors, two and four cylinder water cooled on French lines from three to eighty horse power. The Fox valveless steam engine, which is shown in action by means of steam piped up from the cellar; in this the pistons cut off at one-half stroke and travel the balance of the stroke by expansion. The principle of operation is that one cylinder and piston acts as a valve for the opposite one, both for the exhaust and inlet. This is reciprocated as the position of the pistons change. No mechanism of any kind is in the cylinders—only an arrangement of ports.

The Moore automobile boiler feeder and air pump is another new article, a pump of record breaking power, of which it is said that it never refuses to do its work. This pump is the second working exhibit at this space, which is one of the most varied and interesting among the supply dealers. Another working exhibit is that of the Apple Dynamo and Apple Magneto, both of which are run by a common belt from the same

Digitized by Google

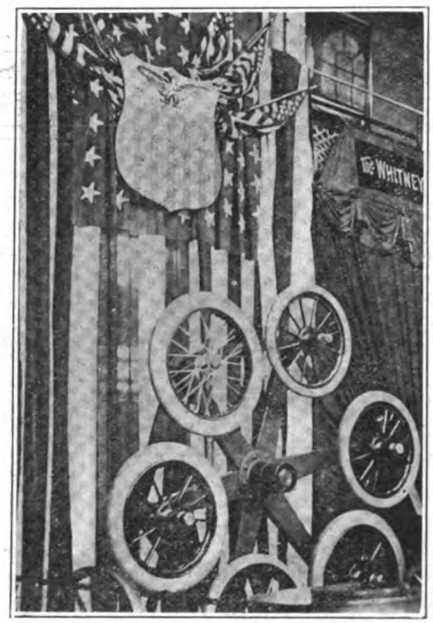
electric motor so that they have equal speed. By this means it is shown that the dynamo gives the superior spark. Some of the specialties shown at this space are: Salamandrin boilers, of which there is one which was made to order for the British War Department and awaiting shipment; Pignolet voltmetres, ammetres and volt ammetres, Kingston carburetters, Corson bicycle stands, Whitney roller chains, Miller gasolene motors, Turner torches, Franz burners, "F. & O." belt dressing, fenders and hoods, motor castings, gas lighters, lamps, bells, goggles, coats, caps, lubricants, etc.

Muncie Wheel and Jobbing Co., Muncie, Ind.—The "Bann-Auto" wheel. This is a new invention that presents some striking improvements on the common type of wood artillery wheel. There is a wood hub inside the metal hub. The spokes have long tenons reaching to the wood hub and these are mitred into place. Instead of being held by rivets only there is a double row of rivets and bolts around the hub, the rivets having the lower line and alternating between every other pair of spokes with the bolts. By this method it is made next to impossible to rip out a spoke or loosen it, and one loose spoke would not cause the others to loosen. This seems undoubtedly a perfect traction wheel for automobiles. The manner of keying the wheel to the ordinary driving axle or axle and sleeve is such that the drive comes on both flanges equally through a common square key. With this construction the axle can be left full size through the back flange and almost through the front flange, which adds greatly to the strength of the driving axle.

The Electro Magnetic Speed Changing Gear Co. exhibit one of the novel features of the show. In place of shifting or sliding gears, with side operating levers for giving the various speed changes forward and reverse, an electro-magnetic clutch is used. This is controlled by a very simple switch device.

The several changes for acceleration or retardation of motion to any desired rate are made without disagreeable jarring and with little surface wear, the bearing surfaces being run in an oil bath. It is impossible to strip gears as in the case of the sliding gear transmission now almost universally used. The electro-magnetic friction clutches constitute the flywheel of the engine, and the two gears of the speed changing contrivance are utilized in the operation of the motor valves. The motor and speed changing gear form a self constituted unit, may be tested as a unit, and may be applied to a direct bevel gear drive or counter shaft drive with chains. The gear is always in mesh, and drives or runs free with relation to the driving shaft dependent upon the action of the electro-magnetic clutches.

A. H. Funke, New York City—Kelecom motors, Autolyte acetylene lamps, spark plugs and imported horns.



New: The Baldwin spark plug, which is designed so as to prevent carbonizing and short circuiting; and this is done in a very novel way. The plug is made with a porcelain insulator, and the outer collar, which screws into the engine, is of steel. There is no tip or special sparking point on the plug. The connecting wire that passes through the plug is attached to a mushroom head of nickel steel. This head is made so that it fits down over the porcelain insulator and prevents it from sooting and short circuiting. The spark jumps from anywhere on the lower edge of the umbrella or mushroom head to the metal collar, and, both of these being circular, the plug has 360 points at which to spark. Seeking the path of least resistance, the current, if it finds one place clogged with soot, jumps and makes the spark at the next easiest point. Another feature about the plug is that of the carrying wire not being cemented to the porcelain, as is usually done, but is held in place by a set nut, and at the bottom of the porcelain,

EXHIBIT OF WHITNEY CHAINS.

between it and the steel wire, there is a small spiral spring which takes up what difference there is between the expansion of the metal and that of the porcelain, so that the latter rarely if ever cracks.

Seven new models of the Autolyte lamp are shown for 1903, making eight styles in all that now are offered. Two novel features have been introduced in connection with the lamps. One of these is the making of a

AMERICAN BALL BEARING CO. DISPLAY.

separate generator, which can be stowed away in some convenient part of the machine and the gas generated carried to the lamp through a rubber or brass pipe. By this means a small lightweight lamp can be used which will burn a long time and give a fine field of light. The other innovation is a candle attachment for the lamps. These are made to hold an ordinary house candle and fit into the socket occupied by the gas burner, which is removable. The idea in this is that for a short trip about the city a candle which will last about three hours can be used and the gas lamp not dirtied. There is a place at the back of the lamps where the idle gas burner or candle holder can be carried when the other is in use. The now well known Belgian-made Kelecom motor, noted for the strength and beautiful finish of its castings, is part of the exhibit that is a staple attraction. One other interesting novelty shown by this concern is a mouth covering for horns, made of thin rubber, instead of wire gauze, so that the reed is absolutely dustproof. The rubber distends when the horn is tooted, and the tone is not impaired.

Veeder Mfg. Co., Hartford, Conn.—One of the most interesting, as well as showy, exhibits is that of the well-known Hartford calculating instrument makers. Odometers and their attachments, counters and tachometers comprise it, the first being shown mounted on stands and run continuously by dynamos at prodigiously high rote of speed. They are made in both the single and trip form, and to fit all sizes and shapes of wheels.

The Tachometer has been in use during the past season, but is now exhibited for the first time. Its ingeniousness is only equalled by its simplicity. Two discs with centers slightly depressed so as to form a reservoir for a colored liquid, and with spur-toothed circumference, are mounted on a similarly toothed wheel affixed to the front wheel of the car. The inside of the revolving disc is ribbed, and as it turns these ribs churn the liquid and by centrifugal force cause it to ascend into a tube which leads to a thermometer-like indicator placed on the dashboard or bonnet. Obviously, the faster the vehicle wheel revolves the greater will be the centrifugal force agitating the liquid and the higher it will rise. The liquid being colored is easily seen on the indicator.

E. J. Willis, New York City—Motors, supplies and accessories. New: The Merkle 1903 motor bicycle, with cushion frame. Also the Herz spark plug, which is shown giving a fat spark when covered with oil. This is a German invention in which a composition of stone is used for the insulating sleeve instead of porcelain. It can be thrown when hot into cold water without being cracked. It is said to be absolutely non-carbonizing, and seems to be so. Another new article in the Willis line of goods is the Perfection Magneto made with a movable base, so as not to suffer from jarring. Another new thing with Willis is the lamp of the Standard Carriage Lamp Co.

C. J. Moore Mfg. Co., of Westfield, Mass., exhibit an unfinished car in the white with a filler coat, ready for power. It is of the runabout type, with a bonnet front, arranged for either eight, twelve or fourteen horse power motor, with a tubular gear and tubular body frame and a wheel steering rod which tilts at the base of the steering rod. They also show a vehicle finished complete known as their Model "J," with a tonneau body of detachable type, equipped with a two-cylinder 16 horse power vertical Frisble motor. The transmission gears are of the sliding type, with friction clutch inside of case. The frame is a tubular and truss one, having long 36-inch platform springs with solid steel braces on rear axle arch. A bevel transmission shaft is used. The foot pedal brake is combined with the hand lever, which locks a ratchet and releases automati-

Digitized by Google

cally through an upright pillar on the right hand side of the car. Two vertical speed levers are in the centre of the floor of the car, to the left of the wheel steering.

Auto Supply Co., New York—Running gears, motors and parts.

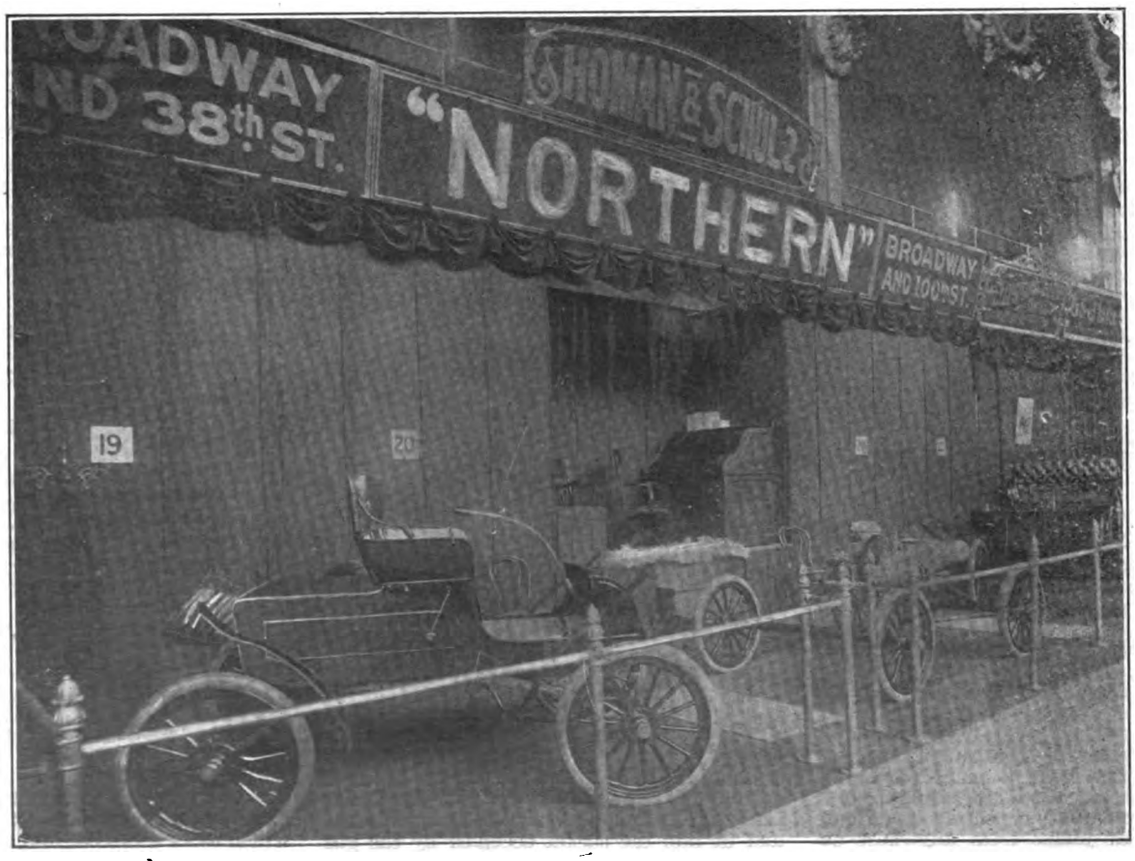
New features: Three speed transmission gear, three speeds forward and one reverse. The drive from the high speed is direct, and all the teeth are engaged at once by reason of telescope gears being used. Thus danger of stripping gears is abolished. Motor with mechanically operated valves, made from one to four cylinders. Three cylinder single acting steam motor, all cylinders operated by one rotary balanced valve; there are no links or stuffing boxes; it has a reverse operated by gears which permits of instantaneous reversing at a speed of 2,400 revolutions without perceptible jar; the cylinder casting is provided with a chamber for muffling the exhaust, so that no separate muffler is needed.

Lane Motor Vehicle Co., Poughkeepsie, N. Y.—A steam touring car, with two seats, $1,500, and a runabout at $1,075.

Desberon Motor Car Co., New York, exhibit a 7 horse power car with a two-cylinder vertical motor. The cylinder is air cooled, but runs up into a water cooled head for about two inches, which is a solid casting without gaskets; the water is fed by a rotary pump actuated by gears from the main crankshaft. The radiators are of tubing wound with wire in loose intermeshing rings in a brush form in rows. A bevel gear drive is used, and sliding transmission. The front axle is curved downward between the front springs in order to clear the motor, and comes within seven inches of the ground. On the wheel steering pillar are located the airbrake and the gasolene control by three small levers, having the pin arranged to drop into suitable slots on a brass plate. The speeds are also controlled by a thumb lever underneath the steering gear wheel. An upright lever with hand locking device disengages the clutch and brakes on the rear wheel. A foot lever also disconnects the clutch and puts the break on.

Twentieth Century Manufacturing Co., New York City—Twentieth Century Lamps for all purposes. New: The newest thing at this space on Wednesday was a cold in the head of "Ex-Gov." F. E. Castles, but it was not so bad but what he could talk about the "La Belle" gas lamp, a brand new creation with an eight inch front of which Mr. Castles said: "I wish you could tell me how to get 10,000 of them to deliver, that is all. We have the orders." The "La Belle" is of 1,500 candle power and on the same plan as a locomotive headlight with a true parabola reflector and is guaranteed to throw a better light than any other lamp on the market. A new line of tail and side lamps also have been added to the catalogue.

Whitney Mfg. Co., Hartford, Conn.—This well known chain making concern have a space fitted up quietly and in good taste. In addition to a showing of Whitney roller and block chains, a dozen chains on sprocket wheels are mounted on a stand, each pair of sprockets being connected with the next one by means of a continuous shaft, the series being so arranged that a large sprocket is alongside a small one, thus gearing first up and then down. The workmanship and finish of the Whitney standard chains are of the highest class, and the judicious solving of the problem of using the most advantageous sizes of rollers, etc., is to be commendable.



Badger Brass Mfg. Co., Kenosha, Wis.—Solar gas and oil lamps. New: A patent automatically operated valve which regulates the supply of both water and gas. The gas, when a certain quantity has been made, backs up against the water and prevents and further generation until the pressure of the gas is reduced by consumption at the tip. Oil lamps for side and rear signals are also being made now in the well-known Solar patetrns that have been standard since gas lamps first came into use. Seventeen different models of the Solar are now produced.

Goodson Electric Ignition Co., Providence, Mass.—Magnetos and spark plugs. New: An alternating magneto generator, provided with a little spring attached to a crank on its armature shaft which is put under tension and tripped into action by the engine, rotating the armature within the magnetic field, producing a single electric impulse and at the proper time to produce the spark. It is capable of being rocked on its base to change the time of ignition at will. In connection with the magneto is shown an automatic plug comprising an electo magnet with a sparking armature.

Electric Contract Co., New York City—Steam gauge and speedometer lights, sparking batteries, safety lights, wire terminals, etc.

New: A little two candlepower incandescent light, made in one piece, with a ring for holding a speedometer. The incandescent lamp has a reflector back of it, and is so inclined over the rim that it will shine on the face of the speedometer; it is inclosed in a steel thimble to prevent breakage, and a bull's eye is cut in the thimble in front.

American Ball Bearing Co., Cleveland, Ohio—Artillery wheels, ball bearing steering wheels, rear axles.

Digitized by Google

New: A rear axle on which the compensating gear cover, the outer cups and the hubs are drawn from sheet steel and electrically welded, thus doing away with all brazing; also a new ball bearing artillery wheel in which the spoke line is over the bearings and is as close as possible to the bolt in the steering head.

Cole & Woop, New York City—Carriage bodies for automobiles.

New: An electric runabout made for George Gould, jr. It has twelve cells, weighs 390 pounds, is about four feet long by three wide, and three and one-half feet in height. It is fitted with three speeds—three, five and twelve miles—and is said to be capable of thirty-five miles an hour. It has been run three thousand miles.

Gleason Peters Air Pump Co., New York City—Air pumps, cocks, guages, etc. New: A hand oiler with a reservoir cylinder eight inches long and a curved stem five inches long to oil bearings that cannot be reached with an ordinary oil can. A triple cylinder pump to be run by an electric motor or attached to shafting for storing air pressure in tanks and a tank for the dashboard are other new things.

Shelby Steel Tube Co., Pittsburg, Penn.—Cold drawn seamless steel tubing. New: Square drawn tubing in all gauges and of all lengths for bedsteads, the interior of elevators, decorative work, etc. The full product of this, the largest steel tubing concern in the country, is too varied to be mentioned at length and too well known to need it.

Thomas J. Wetzel, New York—Midgeley tubular steel wheels, Brown-Lipe spur, equalizing gears and Timken roller bearings.

New features: Midgeley chariot wheel made to look like a wooden artillery wheel; a No. 9 model Brown-Lipe gear for bevel gear shafts; a new divided axle with Timken roller bearings.

Hyatt Roller Bearing Co., Harrison, N. J.—Hyatt roller bearings. These bearings consist of hollow flexible rollers which are self-compensating and can be used without journal bearings or raceways at the end, thereby eliminating two wearing points. They are made with a hollow oil reservoir and a spiral oil conveyor.

American Roller Bearing Co., Boston, Mass.—Roller bearings for vehicle wheels and machinery. New: The newest thing in relation to this product is the increasing popularity of it attested by the fact that last year there were only eight or ten makers at the show using them and at the present show there are just twenty-eight.

Standard Welding Co., Cleveland, Ohio—Electric welded tubing and parts.

New features: A seamless clincher rim, the welding of engine cranks, of tubular axle housings and field rings, and the making of seamless steel bottles for laughing-gas, etc.

Baldwin Chain & Mfg. Co., Worcester, Mass.—Baldwin chains. New: A muffler, just on the market, that is giving great results. A full line of the standard Baldwin chains is shown.

The New Process Raw Hide Co., Syracuse, N. Y.—Noiseless pinions and accurate metal gears. There has been no change in these goods, the only news concerning which is that they are giving satisfaction.

National Carbon Co., Cleveland, Ohio—Liquid and dry cells for ignition batteries.

New feature: A Rex wet cell with closed circuit and a new quadruple autocell battery.

Dixon Crucible Co., Jersey City, N. J.—Graphite lubricants. New: A compound for motor chains, composed of special graphite and animal and mineral lubricants. It is made up in three pound cakes.

Champion Mfg. Co., Brooklyn—Champion transmission gears.

New feature: A high speed clutch, in which all the wear is on two hard fibre washers which can be easily replaced.

The Post & Lester Co., Hartford, Conn.—Supplies and accessories. New: The 1903 Clement bicycle motor of 1¼ horsepower; "Billy" French lamps.

Motor & Gear Co., New York—A chassis in the rough is shown, having a two-cylinder veritcal motor of modern design, and a transmission with sliding gears.

The Whitlock Coil Pipe Co., Hartford, Conn.—Radiator coils and radiators. New: A radiator of the honeycomb type for use with a fan.

Atwood Mfg. Co., Amesbury, Mass.—"Stay-Lit" lamps.

New: A ball shaped rear lamp.

The Dow Portable Electric Co., Braintree-Mass.—Spark coils, batteries and plugs.

R. E. Dietz Co., New York City—Regal oil and Lucifer gas lamps.

Baker Co., Newark, N. J.—Jump spark terminal wires and platinum ignition tubes.

George W. Condon, Newark, N. J.—Condon's roller tube expanders.

Wheel Within Wheel Co., New York City—Wheel within Wheels.

Rushmore Dynamo Works, Jersey City, N. J.—Acetylene searchlight lamps.

Lindsay-Russell Co., Indianapolis, Ind.—Transmission gears and other parts.

Merriam-Abbott Co., Cleveland, O.—Charging plants.

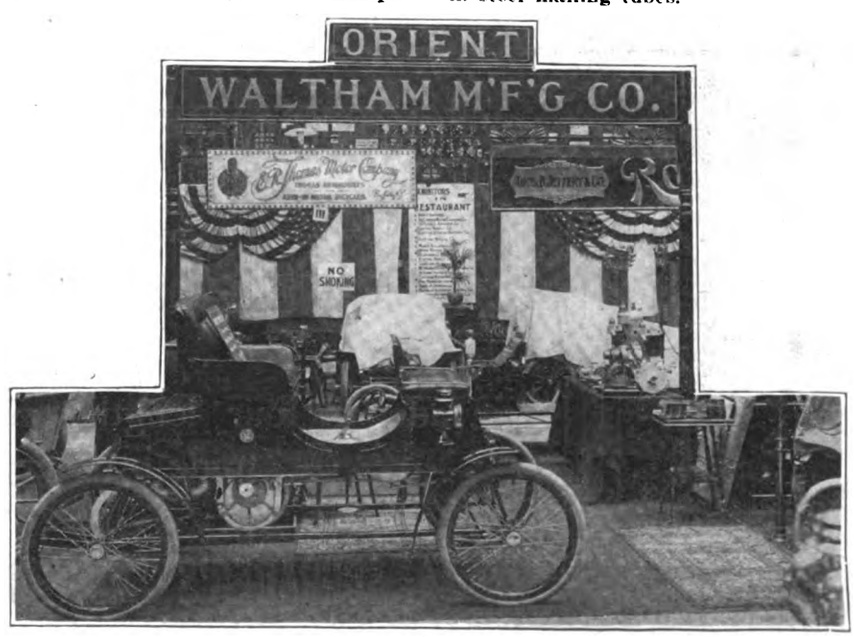
Barber Mfg. Co., Boston, Mass.—Kerosene burners.

Elwin L. Smith, Boston—I. M. C. steering checks.

Rose Mfg. Co.—Lamps.

Gray & Davis, Amesbury, Mass.—Lamps.

Some Souvenirs of the Show.



Souvenirs are not plentiful at the show, but a few of the exhibitors added a touch of interest by giving out trifles. The souvenir joke of the week developed on Wednesday, when the mail brought from Philadelphia a bundle of big envelopes addressed to different persons at the Garden. The outside of the envelopes indicated plainly that they contained advertising matter. There was one cancelled two-cent stamp on each envelope, and also a two-cent "due postage" stamp. After glancing at the envelope, many to whom they were addressed decided that they did not want them enough to pay the due postage and tossed them back to the youth at the Information Bureau, who had charge of distributing the mail in the Garden.

Inside of every one of the envelopes was a piece of cardboard with a publisher's advertisement on it beginning with the expression of "A Ten to One Shot." The souvenir gift consisted of an illustration of this catch phrase made by placing a bright new dime, fresh from the Philadelphia Mint, at one edge and a new one-cent coin at the other.

Now, the boy who was distributing the mail was a bright one, with money-making instinct. He knew what was inside the envelopes, because he had seen some of the recipients open theirs. He did not tell the nature of the contents to those who objected to the due postage, but just kept the whole missive. He thought that if the one addressed did not want their mail that it was all right for him to take it. Of course, he had to make good for the due postage, but he collected 137 envelopes with eleven cents in each, and after he paid the due postage had a net profit of $12.33. Then, alas, some one discovered what he was doing and forced him to disgorge.

A souvenir that is the source of much fun is a lead pencil given out by the Dixon Crucible Company. The leaded end is concealed in a cap, but at the other end it looks just like a sharpened pencil. Those who try to write with the business-like appearing end find that the "lead" is a thin piece of round, black rubber.

The Olds people are giving stickpins representing the Olds mobile. The Apple dynamo makers have distributed several barrels of nice eating apples, the Dixon concern gives away, besides the pencils mentioned, a little tin box containing five dice. The Shelby Steel Tube Co. hand out their catalogues in steel mailing tubes.

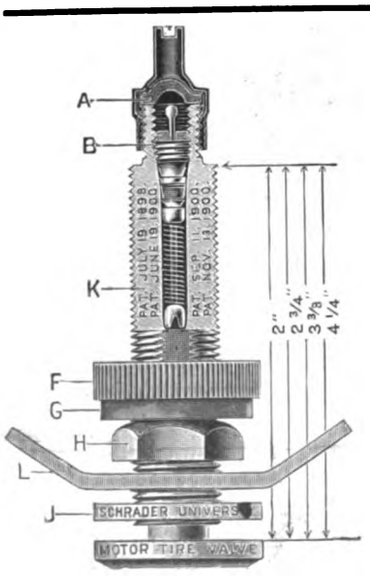
Commentary

Well! Well! Well! I have just seen the first issue of that much touted "automobile daily," and I have wept. If, after having seen it, the gentlemen who "indorsed" it in advance have been able to hold back their tears they are, indeed, a lot of hard hearted wretches. Although I have said he is clever and that he is a wine buyer (did you notice the big champagne ad. in the "daily"?), and that he knew how to "jolly," the foreign father of the publication has, notwithstanding, I understand, described me as a "knocker." To prove that I'm nothing of the sort I've racked my brain for words fit to describe his "daily" effort, and when I term it a gold brick I am trying to pay it the highest possible compliment. I am only an ordinary American hack writer and a graduate from the bicycle school (hear Coughschwartz hiss!), unversed in the ways of Parisian and Hungarian journalism, but—excuse their tears. I'm too full of them for further utterance. I've never seen a "daily" like that one, and really it is too much for me. I don't wonder that Coughschwartz intends to buy wine for the newspaper crowd. I'd never stop buying it during the week if I had made so much "easy money" by selling such a gold brick to the automobile trade, and "stood next" to the champagne people themselves in the bargain.

* * *

Perhaps it is because I lack artistic perception, or it may be that I have not the peculiar appreciation of art, which causes its possessor to lose all idea of everything but color. I shall not attempt to say what the cause is, but the result of it all is that when I look at that fluffy haired, white garbed young woman who is shown on the poster announcing the Automobile Show it makes me shiver. Here is a poster supposititiously intended to advertise an exhibition of the very latest in mechanically propelled carriages; and how does it proceed to do it? A woman, about as inappropriately dressed for automobiling as she well could be, is shown seated in, and presumably driving, an automobile of a type which prevailed when Brooklyn was a field of motor exploitation from which was garnered the finest crop of expensive failure and costly experience the automobile or any other trade ever saw. At the price the manufacturers of genuine automobiles pay to make this Madison Square Garden exhibition thereof a gold mine for the owners of the Garden, and a few others, it seems to me that the manufacturers are entitled to something a little bit more in keeping with the times and the vehicles of to-day than this scarecrow of years ago. If the management and other beneficiaries cannot afford the expense of an up-to-date poster they can at least retire the one they have now used for three years, since it acts only to recall unpleasant recollections of those days, when an automobile was a thing for promoters to get rich from and purchasers to become bankrupted by.



* * *

Did you ever hear of old Mr. Appearance Money? No? Well, you'll not very long remain unacquainted with him if you ever get behind the scenes in the racing game. This wily gentleman, Mr. A. P., originally made himself extremely prominent in the days when people broke their legs trying to be first in the rush to see bicycle races. The drawing cards in these races, the best known riders, were "amateurs"—God save the mark!—and therefore raced for sport alone. No money for them. Oh, no, indeed! But it wasn't long before the promoters of race meets found that the stars did not care to race on tracks where Mr. Appearance Money was never on hand to greet the best friends, trainers, managers or nearest relatives of the stars. Keep your eyes open, and you will see that this very winning individual is not dead; to the contrary, I have every reason to believe that he will cut quite as wide a swath in the racing of automobiles as he formerly did in the racing of bicycles, and in the not far distant future, either.

* * *

I am not, I think, betraying any confidence when I say that the metropolitan police do not like automobiles nor those who own them. In the first place, the automobile is the complete antithesis of everything the average policeman has been taught to look upon as "the real thing." The political boss, the ginmill keeper, the gambler, the sport of every kind, are one and all horse worshippers to a man. These people are to the policeman what the "smart set" are to the socially ambitious—a something to be studied, admired and, when possible, imitated. Naturally, then, policemen do not like automobilists, and the worst enemies of the police will not accuse them of having disguised their feelings, since the automobilist has been frequently and expensively made acquainted therewith. Originally this anti-automobile feeling on the part of the force was an abstract thing; that is to say, the average policeman had no personal grievance against the automobile—he simply reflected the feelings of those higher up. To-day all this has changed, and the policeman, from roundsman to inspector, has a personal hatred of the automobile. With the coming of Captain Piper from the superintendency of an automobile factory to the control of the police, the little love the police never had for the motor vehicle was turned to dislike. Bad as this was, worse was at hand. General Greene was placed at the head of the police, and what is the first thing he does? Jumps into a big semi-racing automobile and rushes around the town, finding police everywhere unprepared for his appearance. Actually inspected six hundred saloons in one Sunday afternoon, all because of the speed of that devilish automobile in which he rode! Could any policeman love an automobile after that? Certainly not! Is there any exception to this rule of dislike? Not a single one.

MECHANICAL VALVES

Their Advantages and Disadvantages Exhaustively Dissected and Discussed.

"The craze of the moment is undoubtedly the mechanically operated inlet valve, and the ranks of motorists are pretty evenly divided into two camps—those who support the re-introduction of this system—tried in the early days of motoring, and discarded—and those who believe in the automatic opening of the valve by suction," says that eminently practical journal, the Motor News.

"Before discussing the advantages and disadvantages of both systems, there are two fallacies which we would like to dispel. The Mercedes proved itself last season to be the most noiseless car on the market, and the public at once jumped to the conclusion that this was wholly due to the mechanically-operated inlet valve.

It has been urged that in the case of the ordinary style the suction is not sufficient to open the valves when the engine is working at slow speed. Consequently, when little work is required, the automatic throttle is brought into operation. At one moment the valves remain shut and no gas enters, the next moment they open and a pretty full charge is admitted with the result that the engine runs with a series of spurts, and much noise is caused. This theory is incorrect. Even at a slow pace the inlet valve must open save in exceptional cases when stuck down by a gummy deposit, which, of course, cannot occur after the engine has been once started.

"The cause of the change is really to be found in the carburetter. The old type is set to give a perfect mixture at normal speed when there is a powerful suction, and consequently a properly proportioned mixture. As the speed drops the rush of air past the spraying nozzle decreases, consequently the supply of vapor becomes less, and the proportions of air entering from above greater, until at last the mixture becomes so weak that it is non-explosive, and the engine will stop altogether unless the pace is accelerated.

"In the Mercedes carburetter, the secondary air inlet supply is controlled off the governor so that as the speed of the engine drops this air inlet is closed. The suction then acts directly on the spray and draws up a supply of petrol in proportion to the supply of air, thus giving an explosive mixture even when the amount reaching the combustion chamber is greatly decreased. No explosions, therefore, are missed, and the engine can be run at a slow, and at the same time, uniform pace with the result that noise is reduced to a minimum.

"We would advance the following evidence of the truth of this contention. The Panhard and Levassor Co. still use the old type of inlet valves in all their cars under 16 horse power, but in the Krebs carburetter have introduced the principle which was adopted in the Mercedes, and with exactly the same result. The engine now runs silently.

"Then again, we tested the matter by a simple experiment. Taking an old pattern Daimler, we reduced the speed of the engine gradually until finally it came to a standstill. We then half closed the apertures to the air cylinder, and were able to start the engine with the acelerator in the same position which it occupied before it came to a standstill, and after that further reduced the speed without causing a stoppage.

"Most motorists have found that partly closing the air inlet facilitates starting. The cause is the same. The slow pace produced by the starting handle gives a vitiated mixture which will not explode, and to remedy this the air inlet is partly closed until the engine gets going.

"The other fallacy arises from the fact that the piston speed is greater than the speed of the valves, and wrong conclusions are drawn therefrom. It is urged—(1) that as the inlet valve does not open until the piston has begun to descend, consequently such a big charge is not admitted as in the case of the mechanically operated inlet valve, which opens exactly at the right moment. (2) That as the spring of the inlet valve is not sufficiently strong to close it before the piston begins to ascend on the compression stroke, consequently part of the charge is forced back through the valve. It is therefore concluded that the mechanically operated inlet valve gives much more power than the ordinary style.

"And now to deal with (1). It must be borne in mind that when the piston begins to descend the suction is very slight and consequently even if the valve did open at once the amount of mixture drawn in would be small. Also, owing to the slow speed of the engine the mixture (except the new carburetter is fitted, as in the case of the Panhard) would consist mostly of air. With the automatic valve the suction when it comes is sudden and strong, and from the moment the valve opens the maximum quantity of perfectly proportioned mixture is drawn in. Consequently on this score the advantage in favor of the mechanically operated valve is trifling.

"As regards No. 2, the piston certainly begins the compression stroke before the inlet valve closes, but in this connection there are two facts which must be boren in mind. First the compression at this point is almost inappreciable, and secondly, there is still a strong rush of mixture through the induction pipe which offers resistance to the effort of the semi-compressed mixture to escape for the minute fraction of a second which it takes the inlet valve to close in. Whether a minute portion of the mixture does escape from the combustion chamber or not we cannot say, but these theories are backed up by practical experience, for leading firms in the trade have tested the

same engines with both systems, and the difference in the power generated was almost inappreciable, except in the case of large engines. It is for this reason that Messrs. Panhard & Levassor only fit the mechanically operated valves in cars fitted with engines of 16 horse power and upward. There may be a slight advantage in favor of the mechanically opened valve, with smaller engines, especially if the Mercedes type of carburetter is fitted, but the advantage is certainly not great.

"Having now pointed out these two fallacies, we shall proceed to deal with the genuine advantages and disadvantages of which there is no question.

"Starting Facilitated.—Difficulty is often experienced in starting through a gummy valve sticking to its seating, so that no charge can be admitted, or (in the old type of carburetter) even if the valve does open, but tardily, such an attenuated charge is admitted that is not explosive. With the mechanically operated inlet valve, the valve must open, no matter how slowly the handle is turned, and with the new carburetter the mixture must be correct. Consequently, the engine starts at once.

"Certainty of Action.—In the old style the valve opens sluggishly if the valve seating, valve stems, or valve stem guides are fouled with gummy matter. The mechanically operated valve must open at the correct moment under every circumstance. Then again in the old style the tension of the valve springs must be kept correct and must be equal, or nearly so, in all the cylinders. If the spring is too strong, the valve will open too late; if it is too weak, it will shut too slowly. A compromise has to be arrived at which is not absolutely correct either for opening or shutting. The new system gets over this trouble.

"Then again, the springs are liable to break or lose their temper through an overheated engine, so that the tension becomes incorrect. In fact, in the old style, the springs require a good deal of attention, and often give trouble.

"Simplicity.—From a constructional point of view there is increased complication, but for the beginner or man who is not expert, the mechanically operated valve will simplify matters in another direction. There is a good deal of skill required to keep the valve springs in the old style of correct tension. With the mechanically operated valves no adjustments are necessary, neither are there any trivial derangements. If a failure does occur it will be a serious matter which cannot be set right on the roadside.

"Additional complication from a constructional point of view and additional cost of manufacture are almost the only serious defects. It means an extra cam shaft with additional gear wheels, wearing parts in the engine, joints and connections, and increased difficulty in getting at the valves. Even in the best made cars the exhaust valve cam shaft may cause trouble of a serious nature. The addition of another cam shaft just doubles this risk.

"So much for the general principles bearing on the matter. The size of the engine, however, is a factor which must be taken into consideration, and this we now propose to examine.

"Earlier in this article we mentioned that experiments had shown that the difference in power gained from the mechanically operated inlet valves was almost inappreciable in the case of cars of comparatively small horse power. The theory is simple. In the small cylinder there is much less compression space. The least downward move of the piston causes a very considerable vacuum pressure which opens the inlet valve almost at once, and as the space to be filled is small, it is filled almost instantly.

"In the larger cylinder, on the other hand, the compression space is naturally very much greater, and the downward motion of the piston does not expand the large quantity of exhaust gas or air in the combustion chamber, enough to cause a vacuum sufficient to open the valve until the piston has descended further on its downward stroke, than in the case of the smaller cylinder.

"Then again, in the case of the large cylinder, the valves are necessarily very heavy, and require a powerful spring to shut them quickly enough, and on this account they open tardily. In the small cylinder the valves are so light that a very light spring will close them quickly. Messrs. S. F. Edge & Co. who do not believe in the mechanically operated inlet valve, have got over this difficulty, in the Napier car, by fitting a three-port valve, and consequently very light springs. Thus the valve opens almost at once.

"Finally, in the small cylinder the suction is so quick and so strong that it induces very great motion of gas in the feed pipe, which has a greater tendency to continue to force and compress gas into the cylinder, even after the piston has begun its compression stroke, than in the case of the large cylinder. In the latter the picton sucks more slowly, and does not generate the same force in the gas of the feed pipe.

"It seems, therefore, to us that while a mechanically-operated inlet valve is undoubtedly advantageous in the large cars, the question still remains to be decided whether or not, in the case of the smaller cars, the advantages counterbalance the drawbacks. This time alone will tell."

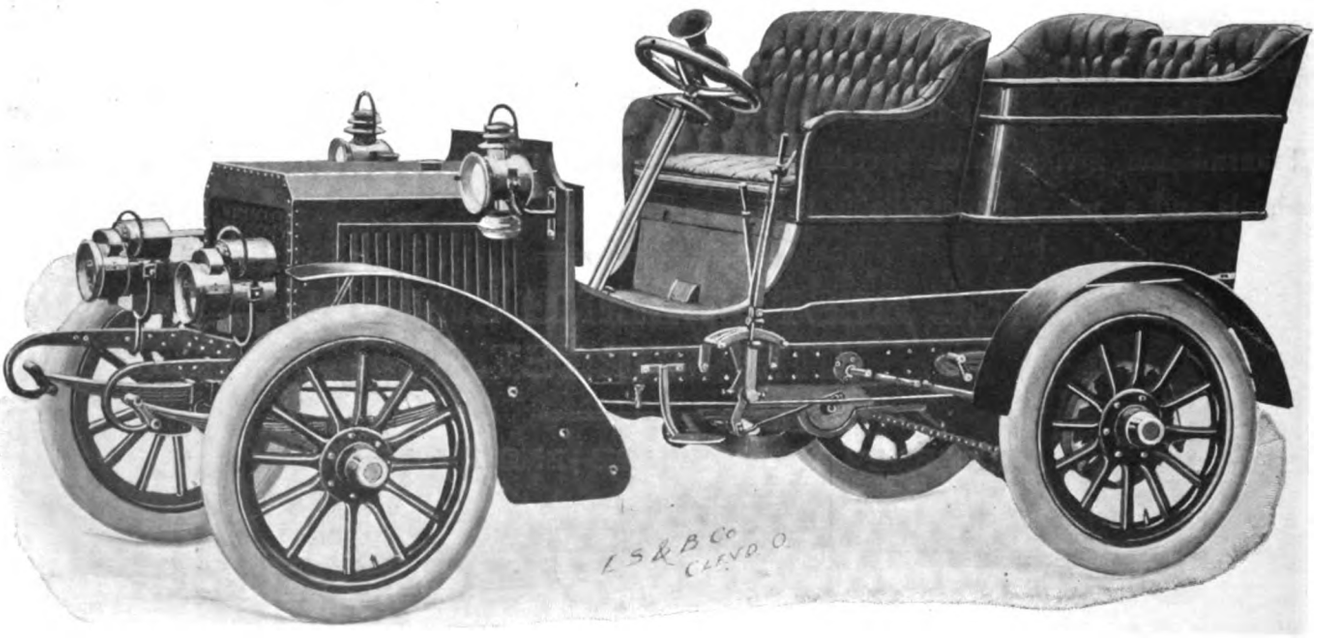
INTRODUCING
GROUT STEAM TONNEAU

First Steam Tonneau put on American Market.



We built the first factory for manufacturing Automobiles in the United States.

GROUT BROS., Orange, Mass.

Write for catalogue and descriptive matter of other styles.

THE STEARNS CAR

Received a lot of very favorable comments at the show.

The style and general design is right. The motor is powerful, with a perfect throttle, and runs silemtly aud wtth no vibration. The attachments on the dsah and controls at the wheel are good points, too. The small tube radiator is ahead of the time, and considering all things, **STEARNS CARS are worth more than they cost.**

Cadillac Auto. Co. of Ills.
1312 Michigan Avenue, Chicago, Western District.

514-520 East Prospect Street, CLEVELAND, OHIO.

DISTRIBUTORS:

PARDEE & CO., 1404-1406 Michigan Boulevard, Chicago, Ill.
STANDARD AUTOMOBILE CO., 136 West 38th St., New York City.
DRISKO, SNOW & ROSS, Inc., 43 Columbus Ave., Boston, Mass.
WM. F. RUDOLPH, 302 North Broad St. Philadelphia, Pa.

THE HAYNES-APPERSON

is unique. It is its own type. It has proved the best for American roads, better than foreign types—better than the so-called "American type" of motor car. It is the oldest make in America—one of the oldest in the world—the most thoroughly developed.

It is interesting to note that the 1903 "Improvements" of the Paris Show have all been features of the Haynes-Apperson Car for years. Our throttle control and sparker with magneto is superior today to the best foreign practice; also our band clutch, free from end-thrust.

We have issued (in addition to our regular catalogue) an interesting booklet that tells why it is the best. Shall we put you down for one? You will greatly oblige us by naming THE MOTOR WORLD when you write. Catalogue free, too.

Runabout, $1200; Phaeton, $1500; Surrey, $1800.

TONNEAU—READY BY SPRING—PARTICULARS LATER.

Chicago Automobile Show

COLISEUM, FEBRUARY 14-21.

REDUCED RAILROAD RATES.

The Central Passenger Association
Western Passenger Association
Trunk Line Association
New England Association

have granted reduced rates an account of the Good Roads Convention of the National Association of Automobile Manufacturers, to be held at the Coliseum, Chicago, during the Chicago Automobile Show, Feb. 14 to 21, 1903,

These associations cover all the territory between Cheyenne, Wyo., (including all Points in Colorado) and the Atlantic coast.

Note These Instructions Carefully.

On purchasing ticket for the trip to Chicago, ask the ticket agent for a certificate **on account of the Good Roads Convention of the National Association of Automobile Manufacturers.**

On your arrival at the Coliseum present it at once to the railroad agent who will be in attendance from Monday to Saturday. He will certify that you have been in attendance, but it is necessary for him to know that there are at least 100 holders of certificates, hence the necessity of delivering them to him immediately on arrival.

Your certificate, when presented at the depot, will entitle you to buy your return ticket at one-third of the regular fare,

Tickets for return journeys will be furnished only on certificates dated not more than three days before the opening of the convention, nor more than two days after the first day of the convention, and presented within three days after convention closes. Sunday will not be reckoned as one of the three days either before the opening date or after the closing date, and all return tickets will be for continuous passage.

EVERY PROMINENT MAKER WILL EXHIBIT.

Morning Sessions Free to the Trade.

SAMUEL A. MILES, Mgr., Monon Bldg., CHICAGO.

AUTOMOBILE SHOW, CHICAGO, FEBRUARY 14-21.
GOOD ROADS CONVENTION, CHICAGO, FEBRUARY 14-21.
BICYCLE JOBBERS ASSOCIATION MEETING, CHICAGO, FEBRUARY 14-21.

To secure the greatest degree of

COMFORT IN TRAVEL

arrange to take one of the fast trains of the

The Week's Patents.

718,072. Running Gear for Vehicles. Alfred S. Baldwin, Syracuse, N. Y. Filed November 23, 1901. Serial No. 83,450. (No model.)

Claim—1. In a running gear for vehicles, front and rear axles supporting trusses and reach bars connecting the same, the rear truss comprising separated lengthwise bars and separate tie bars uniting the ends of the lengthwise bars, said tie bars having substantially central openings and annular bearings, separate sleeves secured in the openings, in combination with separate axles journaled in the bearings and having their inner ends provided with a driving member, and removable wheel supporting flanges secured to the outer ends.

718,076. Battery. Louis Begeman, Cedar Falls, Iowa. Filed January 7, 1902. Serial No. 88,753. (No model.)

Claim—1. An electric battery comprising in combination a containing vessel adapted to form a positive pole electrode, a depolarizing agent forming a lining for said cell, a lining of wire gauze or netting in the interstices or meshes of which said depolarizing agent is partially embedded and supported, a protecting shield covering said gauze or netting, and a negative pole electrode situated within said vessel.

718,096. Vehicle Wheel. Lewis J. Cook, Battle Creek, Mich. Filed September 22, 1902. Serial No. 124,311. (No model.)

Claim—1. In a vehicle wheel, a hub sleeve having external right and left threaded portions near each end, a pair of spoke collars engaging therewith provided with crotch logs and set screws, a felly provided with spoke thimbles and end sleeves, each sleeve embracing a spoke thimble riveted within the same, a tire provided with an inside rib engaging a corresponding groove in the felly, together with a set of spokes having lugs, collars and teats, the whole made and arranged substantially as shown and described.

718,097. Motor Vehicle. Charles Crompton, Worcester, Mass. Filed September 25, 1901. Renewed December 3, 1902. Serial No. 133,778. (No model.)

Claim—1. A motor vehicle including a driven axle, a vertical driving shaft connected thereto and having a universal joint, a driving gear mounted in bearings rigid with the vehicle body, said shaft extending through said gear, a flexible connection between the driving gear and the driving shaft, and a motor carried by the body and connected to the driving gear.

718,131. Muffler for Gas or Gasolene Engines. Joseph F. Kurtis, Springfield, and Herman F. Miller, Dayton, Ohio, assignors to George J. Ihrig and Ernest C. Ihrig, Springfield, Ohio. Filed July 21, 1902. Serial No. 116,329. (No model.)

Claim—1. A muffler comprising a receiving head adapted to be connected with the exhaust pipe and provided with internal baffle plates and with means for regulating the admission of the exhaust gases, a discharge head also provided with internal baffle plates, a plurality of pipes connecting the receiving and discharge heads, and means for regulating the escape of the exhaust gases after passing through the discharge head, substantially as described.

718,161. Motor Vehicle. Oscar H. Schildback, South Bend, Ind. Filed March 28, 1902. Serial No. 100,496. (No model.)

Claim—1. In a motor vehicle, the combination with the body portion having upon its under side a motor support, said motor support consisting of parallel bars grooved upon their outer sides, and a motor the upper end portions of which are provided with lugs or projections adapted to be adjustably and removably mounted in the said grooves of the parallel bars.

718,213. Motor Vehicle. William Norris, Preston, England, assignor to T. Coulthard & Co., Limited, Preston, England. Filed July 22, 1902. Serial No. 116,517. (No model.)

Claim—1. In a steam propelled road vehicle, a front platform of the vehicle, a boiler carried thereon, a fuel bunker immediately in front of the boiler adapted to form a buffer in case of a collision, and a driver's seat, steering wheel and controlling lever at one side of the boiler, substantially as and for the purpose set forth.

718,231. Motor Vehicle. William E. Whitbread, Godalming, England, assignor of one-half to Robert Corkling, London, N. W., England. Filed June 7, 1902. Serial No. 110,650. (No model.)

Claim—1. In a vehicle the combination of a frame carrying a leading wheel and two following wheels, a resilient support on the frame for the fore part of the vehicle, a rod forming a pivotal connection between the frame, the support and the vehicle, and serving also as a steering spindle and operative connections between the spindle and the front wheel.

718,244. Supporting Shoe for Vehicles with Air Tires. Leon Combrun, Clichy-on-the-Seine, France. Filed August 25, 1902. Serial No. 120,993. (No model.)

Claim. A supporting shoe for vehicles with pneumatic tires composed of two angle irons and a connecting plate bearing on the ground and having lateral arms, one pair of which is rigidly secured to one of the angle irons, the other pair being pivoted to the opposite angle iron, each arm being provided with a profile to fit the sides or edges of the rim and being provided with means to clamp the arms against the rim substantially as described and for the purpose set forth.

718,275. Wheel for Road Vehicles. Glencairn S. Ogilvie, Woodbridge, England. Filed March 19, 1902. Serial No. 98,879. (No model.)

Claim. In a wheel having a continuous outer ring or tire separate from the felly and movable circumferentially thereon, stops such as projecting from the felly and projections such as from the outer ring in combination with elastic balls or their equivalents interposed between them to constitute an elastic driving medium between the felly and the outer ring, substantially as described.

718,299. Valve for Gas Engines. Edwin E. Arnold, Pittsburg, Pa., assignor to the Westinghouse Machine Company, a corporation of Pennsylvania. Filed May 22, 1902. Serial No. 108,541. (No model.)

Claim 1. The combination with a hollow valve having a horizontally projecting stem, of an internal, tubular bearing for said stem, and means for supporting said bearing independently of the stem.

718,324. Means for Locking the Steering Mechanism of Motor Vehicles. Edward Devlin, Paterson, N. J. Filed September 18, 1902. Serial No. 123,864. (No model.)

Claim 1. In a steering gear for motor vehicles, the combination of a locking member, a steering spindle slidable through the locking member and connected therewith for both parts to turn together at all times, a movable locking member arranged for engagement with said turnable locking member, and means for controlling said movable locking member.

718,334. Igniter Apparatus for Gas Engines. William P. Flint, Pittsburg, Pa., assignor to the Westinghouse Machine Company, a corporation of Pennsylvania. Filed June 26, 1902. Serial No. 113,374. (No model.)

Claim 1. In igniting apparatus for gas engines, the combination with a dynamo, a secondary battery and an igniting device, of a switchboard having a spark coil and switches so constructed and arranged as to connect either or both of the sources of energy with the coil and igniting device.

Digitized by Google

718,482. Cooling Means for Explosive Engines. Fred A. Law, Hartford, Conn., assignor, by mesne assignments, to Morton Trust Company, trustee, a corporation of New-York. Filed June 26, 1899. Serial No. 721,882. (No model.)

Claim 1. The combination with an explosion engine, of a steam supply and a conductor between the steam supply and the exhaust chamber of the engine, the outlet of said conductor being arranged in proximity to the exhaust valve, whereby steam is constantly supplied to the exhaust chamber so as to impinge against said valve and the adjacent valve parts when the exhaust valve is closed, substantially as described.

White Steam Touring Car

FOR 1903

Is a Steam Car of Chassis Construction with the Distance of a Gasolene and the Ease of Operation of an Electric.

To the principle of producing great power and wasting practically none of it is due much of the success of the **"White,"** which of all automobiles has to its credit **four first awards** in the **New York-Rochester** endurance test of 1901; **four first awards** in the **New York-Boston-New York** reliability run of 1902, and its **perfect scores** for reliability in the **great English 650-mile reliability trials** of 1902. But one other car achieved this distinction in the English Trials. These marvelous triumphs may be taken as an accurate criterion of the **"White's"** supremacy.

PRICE, $2,000.00

SPECIFICATIONS.

SEATING CAPACITY,	Four	EXTREME WIDTH,	5 feet
RATED HORSE POWER,	Ten	EXTREME HEIGHT,	5 ft., 2 in.
ENGINE,	Compound	CAPACITY OF GASOLENE TANK,	10 gals.
WHEEL BASE,	6 ft., 8 in.	CAPACITY OF WATER TANK,	15 gals.
TREAD,	4 ft., 8 in.		
WHEELS,	30 inches		
TIRES, (Goodrich Clincher)	4 inches		
WEIGHT, (Tanks Filled)	1600 lbs.		
EXTREME LENGTH,	10 feet		

Condenser, Two Independent Set of Brakes, Automatic Cylinder and Engine Lubricator.

EQUIPMENT:—Condenser, Side Lamps, Set of Tools, Horn, Tool Case.

SUCCESS in every-day use, in reliability contests, in races, and in record-trials, has proved the **"White"** system of motive power to be the most noteworthy achievement of automobile developments. The 1903 **"White"** is equipped with every improvement which our experience has shown would be of advantage to the car. Greater power and economy, and greater ease of operation, combined with the noiselessness, has always characterized it.

These advantages are secured by means of a **compound engine**, the **"White" special condenser, a chainless drive, automatic cylinder and engine, lubrication, two independent sets of brakes**, and a variety of minor improvements, which assure the **"White"** purchaser that his vehicle possesses a system of producing and conserving energy unexcelled in the automobile realm.

Safety is the **"White"** keynote. The **"White,"** as is now well understood, has no boiler, and a boiler explosion is, therefor, impossible. The power of the **"White"** car is produced in a generator, in which the possibility of accident is non-existent.

The working parts being entirely encased, the **"White"** is impervious to mud and dust; while its operating parts are so arranged that a lady need have no fear of soiling even a glove in running the car.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, January 29, 1903. No. 18

N. A. A. M. IN SESSION

Reports of Year's Work Presented and Five Directors Chosen—Rebates to Members in View—Plan of next Reliability Contest Discussed.

Except for a discussion of reliability contests, which was precipitated by H. Ward Leonard, the annual meeting of the National Association of Automobile Manufacturers, held last Saturday morning in the assembly room of Madison Square Garden, New York, was very tame. The room was bitterly cold; it was the night after the dinner of the N. A. A. M., and the attendance was not very large. The concerns represented were:

Active members—Ajax Motor Vehicle Co., New York; Apperson Bros. Automobile Co., Kokomo, Ind.; the Automotor Co., Springfield, Mass.; the Baker Motor Vehicle Co., Cleveland, Ohio; Crest Mfg. Co., Cambridge, Mass.; Duryea Power Co., Reading, Pa.; Electric Vehicle Co., Hartford, Conn.; the General Automobile & Mfg. Co., Cleveland, Ohio; Thomas B. Jeffery & Co., Kenosha, Wis.; the Mobile Co. of America, New York City; Olds Motor Works, Detroit, Mich.; Peerless Motor Car Co., Cleveland; the George N. Pierce Co., Buffalo, N. Y.; Searchmont Automobile Co., Philadelphia, Pa.; Stearns Steam Carriage Co., Syracuse, N. Y.; Studebaker Bros. Mfg. Co., South Bend, Ind.; Ward-Leonard Electric Co., Bronxville, N. Y.; White Sewing Machine Co., Cleveland, Ohio; the Winton Motor Carriage Co., Cleveland, Ohio; Woods Motor Vehicle Co., Chicago, Ill.

President S. T. Davis read a long and complete report of the year's doings, which in part was as follows:

Organization and Growth.—This association was formed at the close of the automobile show in Madison Square Garden in November, 1900. It started with thirty-eight members, and at the end of the year 1901 had a membership of eighty-seven; the membership at the close of last year was 129, embracing practically all of the active manufacturers in the automobile business, both of completed vehicles and accessories.

Finances.—The organization started and operated for two years on its small receipts for initiation fees and dues. Last year it shared in the profits of the automobile show in Chicago, receiving therefrom as its share $4,347.26, after all its expenses in connection with the show had been paid, including the expenses of the secretary in Chicago for two months.

Automobile Shows—One of the principal expenses saved to the manufacturers has been saved through the effort of the association to have only two automobile shows in the United States during any one year. To that end the association made arrangements with the Automobile Club of America and the Madison Square Garden Co. to hold shows in New York City jointly, the association sharing in the profits to the extent of 30 per cent, after paying all expenses, being equally with the club, the Madison Square Garden Co. taking 40 per cent of the profits, after paying all running expenses. The association has also made arrangements with S. A. Miles, of Chicago, and the Automobile Club of Chicago to hold a show in the West, in the city of Chicago, from which it receives one-half of the profits. The association expects to receive from these two shows during the year about $15,000 in the aggregate. I expect that at the end of the current year the association will have sufficient funds, after paying its running expenses, to enable it to rebate to its members a portion of the expenses which they incurred during the automobile shows at New York and Chicago, probably in proportion to the space occupied and paid for. In promoting these two shows the association has enabled the members to show their product in the two large trade centres of the United States, and has made it unnecessary for them to exhibit anywhere else, thus saving the annoyance and expense of small shows in other cities.

Standardization of Parts.—The association has endeavored to standardize those parts that all manufacturers use, such as lamp brackets, single tube tire lugs and rims, clincher rims and chains. The first one taken up was the standardization of the

(Continued on Next Page)

MAKERS MEET COMMITTEE

And Approve Projected Contest for Commercial Vehicles—Will Probably Occur in May—The Motor World's Suggestion Finds Favor.

It was interesting to note at the meeting of the contest committee of the Automobile Club on last Thursday, at which the makers of commercial vehicles were invited to be present and make suggestions regarding plans for a test of commercial vehicles, that interest was manifested on the part of several concerns who were not known to be making or preparing to make wagons or trucks. Those represented at the meeting were the Vehicle Equipment Co., American Steam Carriage Co., Daimler Mfg. Co., Trumble Mfg. Co., Fischer Motor Vehicle Co., H. Bartol Brazier, Union Motor Truck Co. and Locomobile Co. of America.

Letters in which the idea of a commercial vehicle contest was commended were received from the Morgan Truck Co., Electric Vehicle Co., Fournier-Searchmont Co., Adams Express Co., Upton Machine Co., Trumble Mfg. Co., Thornycroft Steam Wagon Co., Stearns Steam Carriage Co., Grout Bros., St. Louis Motor Carriage Co. and Chicago Motor Vehicle Co.

The contest committee, consisting of John A. Hill, chairman; Emerson Brooks and Roland R. Conklin, explained that it was deemed desirable to hold a contest some time in May which will demonstrate to the public at large the practicability of the motor truck and delivery wagon and their superior value for business purposes. As outlined at the meeting, the contest will be one of two or three days' duration, open to business cars of all types, and in accordance with the suggestion made in the Motor World of January 15 a goodly portion of the course will be through the crowded streets of the business part of the city. It was decided not to complete the plan for the contest until after more suggestions had been received from manufacturers who were not present.

Digitized by Google

N. A. A. M. IN SESSION.

(Continued from from Proceeding Page.)

single tube tire lugs and rims. After consulting with the tire manufacturers and the members of this association this was accomplished. We expect that at an early date the clincher rims will be standardized as well as the rims for solid tires. We have communicated with the lamp manufacturers, and hope at an early date to be able to give to the members a standard lamp bracket, to which all lamp manufacturers will make their lamps conform.

Standard Warranty.—The public demand for a guarantee with each machine for a definite length of time has been so persistently asked for by purchasers of automobiles that the association got up a standard warranty, which is now used by its members.

Legislation.—The association has endeavored in a quiet way to prevent adverse legislation wherever possible. To this end we have co-operated with the different automobile clubs in the different cities of the country, and our joint efforts have in most cases been reasonably successful. Some of the States and cities have even gone so far as to threaten to legislate for certain requirements on automobiles, such as two sets of independent brakes and certain requirements regarding muffler, etc.

Transportation.—The association has been working for some time endeavoring to reduce the freight rates, which at present seem to be unnecessarily high, and the railroad companies seem to discriminate particularly against carrying automobiles. Our inquiries to the manufacturers have proven that the claims for damages against the railroads have been practically nothing at all. Notwithstanding this fact, the only thing we have been able to do was to prevent a contemplated rise in the freight rate on automobiles and more stringent regulations. This is only a step, but in the right direction, and we hope by concert effort to accomplish more in the coming year. In this same line we have taken up the insurance during transit, and have had the ocean insurance rates reduced to about one-half, and we are now working on the railroad insurance rates.

Foreign Trade.—Through the efforts of the association in Washington the United States Government has instructed all consuls in foreign cities to furnish a complete statement of the condition of the automobile industry in the city in which each is stationed, and to keep the department informed regarding the matter regularly, as he does in other lines of industry.

General.—There are a number of important topics that it has been impossible for the association to take up and to consider fully during the last year, owing to their number and the lack of time. One of the most important is practical automobile tests, such as endurance runs, hill climbing contests, stopping contests, races, etc. I think these matters should have the earnest consideration of the members of the association and their recommendations made to the various organizations that give these contests. The secretary of the association has been gathering information for the last few months, with the idea of putting before the members a plan for a directory of storage, repair, charging and supply stations throughout the United States, the information to be supplied by the members and their agents. A committee of the association is now working on a method of giving to employes of manufacturers a certificate of competency when they leave the firm, the object being to state on the certificate that the individual named has been employed for the company for —— number of days, months or years, and that they are competent to operate or to repair, or to operate and repair machines of their manufacturers. This certificate would be forwarded to the secretary and the seal of the association put on it, and would expire at the end of a year. Of course, there are further details in regard to this matter, but something will eventually be worked out which, I think, will be of value to manufacturers, dealers and the purchasers of automobiles.

The report of Treasurer Percy Owen, read by Secretary Harry Unwin, showed that the year 1902 had been entered upon with a deficit of $370.48, which was quickly made up by the receipts from dues, and at the close of 1902 there was a balance of $1,419.23 on hand, with accounts payable amounting to $717.94.

On a motion made by Percy Owen the election of five new members of the executive committee for a three year term was taken up, and by a unanimous vote the secretary was directed to cast one vote for the five previously nominated, as follows: H. Ward Leonard, Ward Leonard Electric Co., New York City; Windsor T. White, White Sewing Machine Co., Cleveland, Ohio; Lucius T. Gibbs, Vehicle Equipment Co., New York City; F. S. Fish, Studebaker Bros. Mfg. Co., and I. A. Page, J. Stevens Arms & Tool Co., Chicopee Falls, Mass. Mr. Page succeeds W. C. Baker. All the others were re-elections.

H. Ward Leonard launched the talk about reliability runs by saying that plans for such contests should be considered by the manufacturers and suggestions made to the clubs that promote them, because the manufacturer is more practically interested than any one else, and has more at stake. A reliability run with a limit of fourteen miles an hour, he declared with emphasis, was a farce. He also scored the observer system, saying that it was not just to have the manufacturers competing adjudged by a lot of unknown men of uncertain competency. His idea was that one of two sorts of contests should be adopted—have the cars compete in a contest that will embody every sort of test, including speed, hill climbing and gasolene consumption, or else have them join in an affair such as is held in France, where the first car to finish is the winner. Windsor T. White said he favored a run of 1,000 miles in length.

After a little more discussion Mr. Leonard made a motion that the association should favor a contest on similar lines to the Circuit de l'Herault, held annually in France. In this contest the course is about 100 miles, and a total of thirty marks is awarded, as follows: Gasolene consumption, 10; reliability, 8; hill climbing (including brake test), 5; comfort and appearance, 5; speed, 2.

John Brisben Walker called attention to the half mile of road that extends north from the Harlem Speedway. This, he said, would make a fine place for a contest, which should begin at the Kingsbridge Road and lead to the top of the hill and down again. It should be a speed contest to the top of the hill, and coming down there should be a couple of stops made. A motion that such a contest should be recommended to the Automobile Club was carried.

With regard to the proper time for holding shows there was some difference of opinion as to whether it should be later or earlier, but the preponderance of opinion was in favor of continuing to hold them at the present time. Mr. Penning, of the General Automobile & Mfg. Co., said that in view of the crowded conditions of this year's show in Madison Square Garden he thought that in the future it mighe be found advisable to exclude the supply and parts dealers from the complete vehicle shows and let them have a separate show of their own, either before or after the exhibit of motor cars. This is in line with the suggestion thrown out by the Motor World of January 15. The matter was finally referred to the executive committee, with the recommendation that the views of all the members be obtained.

It was suggested by Mr. Penning that another measure of relief which it might be well to adopt would be that of allowing every applicant just one space until everyone was cared for, and then divide what space there might be remaining among those who wanted more on some equitable plan which might be devised.

President Davis said the present show would yield a gross profit of nearly $40,000, of which the N. A. A. M. gets 30 per cent, the Automobile Club 30 per cent and the Madison Square Garden Co. 40 per cent. At Chicago the N. A. A. M. gets one-half the profits. Out of the gross profit $10,000 has first to be paid for the rent of the Garden, and the percentage allotments are paid out of what remains, the Garden company getting the $10,000 first and then 40 per cent of what remains.

In the course of his preliminary remarks Mr. Davis suggested that a plan should be devised under which a portion of the profits from the shows can be rebated to the exhibitors in proportion to the prices paid by them for rent of spaces. Another suggestion by the president was that the association should do something about arranging for a display at the St. Louis Exposition.

The executive committee will meet on February 4 to elect a president and other officers from among their own number.

N. A. A. M. BANQUETS

Good Fellowship and Fair Speeches the Rule—Scarritt's Vivid Word-Picture of the Future.

There was a roundup of the "good fellows" of the trade at the annual dinner of the National Association of Automobile Manufacturers at the Waldorf-Astoria in New York on last Friday night, and yet withal the dinner suggested the inadvisability of introducing social festivities during the show week. Every one was tired, the dinner did not begin until an hour and a half after the time set, and it was in the small hours that it was concluded. The following morning every one who had attended it was more tired than ever—some of them had headaches and felt illy fitted for the work of the last day, to say nothing of the Automobile Club's dinner on Saturday night.

About two hundred and fifty went to the dinner, which was notable for the fact that it was very wet in some parts of the room and very dry in others, for it was left to every one to buy his own wine. The representatives of the big New York papers were directed to go into the room and select a table for themselves, and that was the last attention paid to them. Before the dinner was concluded most of the reporters left without waiting for the speeches, and there was scant notice of the affair the following morning.

President S. T. Davis, jr., presided, and Winthrop E. Scarritt was toastmaster. There was much informality throughout, and some of the interruptions of the speakers created great amusement. President Davis, while making his preliminary remarks, was called upon to "open your muffler." Mr. Scarritt read a very interesting speech with oratorical effects. It made a great hit when he brought out with elaborate emphasis the phrase "we manufacturers." In part Mr. Scarritt said:

"Gentlemen: My first sentence must be one of hearty congratulation on the splended progress you have made in your chosen industry during the year which now marks its close. The great epochs in industrial history have always been preceded by long periods of preparation. Not until the dawn of the twentieth century was man prepared for the automobile. In the realm of motion the modern motor car stands on the dividing line between the amoeba and the archangel. It is a far greater cry from the ox of the ancients to the automobile of to-day than it is from the modern motor car to the glistening airship of the future. A combination of the best material known to modern science and the highest mechanical skill of the age are necessary to create a vehicle upon the integrity of which human life depends every moment it is in use. This emphasizes the fact that we, as manufacturers, should provide our cars with every possible safeguard. They should be equipped with double brake, with efficient mufflers and with every known device tending to make them strong and safe.

"This is one of the most religious bodies in the world, not in words, perhaps, but in that higher test of worship, deeds. It was the great Benjamin Franklin who said, 'Worship most acceptable to God is service to mankind.' Measured by this high test, you are doing a great religious work because you are advancing an industry which some great day is to take the burden off the shoulders of humanity. Permit me a concrete illustration:

"Take the present congested condition of our streets in this great city. Think what it would mean if self-propelled cars could be substituted for horse drawn vehicles. First, it would mean clean and sanitary streets. This reason alone would be sufficient to justify the exchange. Second, consider the additional space that could be saved if all the horses on our streets were instantly removed. That would mean practically doubling the width of the streets. Third, it takes a horse drawn truck one hour to drive from the Battery up Broadway to Forty-second-st. A motor car would do this in exactly one-half the time and carry double the load. That would be equivalent to taking out of the streets one-half of all the vehicles all the time. What a godsend this would be to our congested city.

"Gentlemen, I do not believe that the wildest dreamer of us all has for a single moment got the faintest glimpse of the great place the automobile is to fill in our modern life. The coming of the motor car is to mark an epoch in civilization as did the discovery of steam, the sewing machine, the electric telegraph and the telephone. You, gentlemen, are laying the foundation of a structure whose massive walls and towering minarets will some day be seen and known and appreciated by all men.

The band played "He's a Jolly Good Fellow" when this speech was ended. Borough President Cantor was introduced as "one of the original good roads men," and three cheers were given for him. When a tiger was called for a voice said, "The Tiger doesn't go with him."

Mr. Cantor called attention to the fact that Captain Miles O'Reilly was abroad in the Tenderloin—this, he said, was by way of caution to some of the guests. He said that he owned an automobile, and had thought on two occasions that it was an airship. In speaking of good roads, he said that the bicycle rider was the first man who had considered the subject of good roads with any seriousness, and that the automobilists should do much more than the cyclists had been able to do.

F. L. Smith, who was down to speak on "How to Sell an Automobile," said that he wanted to proclaim that the main thing to be remembered by the automobile trade at this time was the "great doctrine, 'don't knock.'" He said that the doctrine of not knocking was not understood by all present, but that the advice was of the same order as that of don't monkey with the business end of the mule, for the solar plexus is always open for business.

T. C. Martin was introduced by Mr. Scarritt as "the bald poet," and in retorting good naturedly he said that "before Mr. Scarritt is much older in the manufacture of automobiles he will be a damned sight balder than I am." He continued: "I have lived through many vicissitudes of electricity, and I still believe in the future of the electric automobile, and that the time is near when 75 per cent of all traffic business will be done by electric automobiles."

John S. Wise, of Virginia, spoke in a humorous strain, saying that he had had a delightful dream of a lot of persons who had been crippled and maimed by automobiles coming to him in a stream to institute suits and that he had won the suits. That he dreamed as a lawyer, but he was an automobilist, and as such knew that the dream was silly.

At the conclusion of the set speeches Mr. Scarritt proposed a toast to the American team that is to compete for the Bennett Cup with the hope that one of the team would win it. This toast was hailed with loud acclaim, and after the meeting had formally broken up Messrs. Winton, Mooers and George Banker spoke when called upon. Mr. Winton said he hoped an American would win the cup; Mr. Mooers said he was sure an American car would win; he thought it would be a Peerless, but if it proved to be a Winton he said he would be the first one to go up and shake hands with Mr. Winton. George Banker counselled that there should be no jealousy between the memberr of the team, but that each should go over with the one idea of having an American car win, and be willing to help his companions, if necessary, to gain a victory.

White Probably next President.

When the directors of the National Association of Automobile Manufacturers meet on Wednesday next, Feb. 4th, to elect officers, it seems likely that the selections will be made harmoniously and unanimously.

The only man mentioned for the office of president is Windsor T. White, of the White Sewing Machine Co., of Cleveland, Ohio, and the consensus of opinion of the directors makes it appear that he will be elected without opposition.

Mr. White has charge of the commercial end of the White Sewing Machine Co., which is one of the most substantial manufacturing concerns in the country. He is president of the Cleveland Automobile Club, and has a large circle of acquaintances throughout the country and is a high grade man, both socially and commercially.

For the three vice-presidents are mentioned M. J. Budlong, of the Electric Vehicle Co., Hartford, Conn.; Charles Clifton, George N. Pierce Co., Buffalo, and Ward Leonard, New York, all representative men.

Percy Owen, of the Winton company, will undoubtedly be elected treasurer, a position which he has filled in a satisfactory manner during the last year.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y, Post Office, November, 1900.

NEW YORK, JANUARY 29, 1903.

The Verdict.

It was a great show—so great that it is difficult if not impossible to conceive how there can ever be a greater one, it matters not from what standpoint it may be viewed.

How the Show was Handled.

They say that great occasions make great men; inferentially, great occasions also make great newspapers or trade papers.

The automobile show was in the nature of a great occasion—the greatest probably that has yet occurred in the world of automobilism. It is interesting, therefore, to remark how the automobile journals handled the subject and proved themselves equal or unequal to the occasion.

Horseless Age—Briefly summarized the features of less than one-quarter of the exhibits; probably will finish its report before July 4 next.

The Automobile—Dealt not with summaries of features, but with the glittering generalities of only a part of the exhibits.

Motor Age—After inveighing against "puffs" and "write ups," devoted itself to nothing else save amplification of statistics.

Automobile Topics—A hodgepodge of nothingness.

MOTOR WORLD.—A complete and detailed report, not of summaries or of generalities or "write ups," but of every tendency, every car and feature of it, every new sundry and accessory and their features—all those were sought for, and when found—they were found in plenty—were brought out and described, each in its separate department, while the superiority of its illustrations and the newness and importance of the cars and other subjects of illustration are apparent to all who have eyes to see with. And this full report did not interfere with the gathering and publication of the current news of the week—most of it exclusive news.

"The Motor World had the only report worthy the name," was the way an old newspaper man expressed it, and added, "If you are not proud of it you ought to be. It developed the real greatness of the American trade; the trade should be able to see and appreciate the service."

The Motor World is proud. We trust the trade is appreciative.

Touring Cars and Tonneaus.

Twin features of the show, the touring car and the tonneau body, were seen everywhere. In gasolene cars the number of makers who did not produce something of the kind were so few as to be almost negligible. Even with steam vehicles there was a fair sprinkling of the combination, and they were not unknown among the makers of electrics.

To fully understand this wonderful vogue of the tonneau body—for it and the touring type of car are to all intents and purposes synonymous—it is necessary to review the history of this body and to touch upon its real and acknowledged merits.

Like so many other good things pertaining to automobiles, the tonneau body came from France. Two years ago it was all the rage in Paris and the provinces, possibly to an even greater extent than it is here now. A year later, that is, at the Paris exhibition of 1901, its extinction was threatened by the introduction of the double phaeton. But whatever fears may have been entertained on the score of the latter they appear to be dissipated; for the double phaeton made but little progress, and was barely mentioned at the show held in Paris last month. Thus even in the changeable city on the Seine the new has not succeeded in supplanting the old. The reasons are not far to seek.

The tonneau body scores heavily on looks. With it the seating capacity is greatly increased; there are many more square feet of cushion surface than in the double phaeton or any other type of body. As with seating area, so with baggage stowing capacity. There is, or seems to be, an infinity of room for the bestowal of odds and ends of all kinds. The body swells out, sideways and backward, until a prodigious amount of space is made available.

From the construction of the motor in front type of car, the rear seats are necessarily positioned between and over the rear wheels. Hence access to these seats must be had from the back, as with a tonneau body, instead of from the side, as would be the natural way with the double phaeton type, with the front and rear seats parallel. If the latter style is adopted some method must be provided whereby the occupants can enter from the side, a matter of most difficult accomplishment. With a tonneau body the door in the back arrangement is most natural. There is no wheel to climb over or come in contact with. Instead an easy and natural method of ingress by means of a door in the back, with a broad and low step leading to it. To these solid advantages there is to be added some that are such more in appearance than in fact.

The tonneau body is pleasing in appearance and a welcome change from the usual straight parallel seats of the horse drawn carriage. It looks like a touring car, as no other type of automobile or other vehicle does. The glimpse of the interior, caught through the open door, impresses itself upon one, with its luxurious seats, high back and changeable position, it being possible to face either forward or sideways.

It is these things that make for the success of the tonneau and enable it to continue its vogue. Because of them the tonneau now dominates the American automobile as it has done the French, German and British ones for years. It does not seem even yet to have reached the height of its popularity; rather it is increasing it, until there bids fair to be nothing else in cars designed to carry more than two passengers.

Of the tonneau bodies themselves it can be said without hesitation that they show a vast improvement. Even yet there are bodies that are toylike, with tiny doors,

Digitized by Google

through which no autoist of more than average avoirdupois can squeeze without trouble; and even if the door obstacle be surmounted, it is found that in the seats one is cramped and confined to an almost intolerable degree.

But the majority are free from these shortcomings. Roomy and comfortable, well springed and upholstered, frequently with an extra seat, rendered available by the closing of the door, thus making a phaeton rear body, they are as luxurious as can be desired. If anything can insure the permanency of the tonneau it is such examples as these.

Where Interest Lags.

The interest displayed in and created by the annual meetings of both the American Automobile Association and the American Motor League last week was distinctly deplorable. No one, not even the newspapers, seemed to care what they did or how they did it, and the paucity of numbers and lack of enthusiasm on the part of those who did attend was far from inspiriting.

The League to our mind made a very false step and alienated support by choosing for its head a man who is not, and never was, an automobilist, and who has served the interests of automobilists only when he was paid for it, and who then lost the one case in which he was engaged. His only claim to attention is that he served as president of the League of American Wheelmen during its boom days, and employed brass band and circus methods to increase its membership, and while posing as a patriot drew a fat salary from the treasury, and created others for his henchmen in the Tammanyized ring that he builded within the now impotent organization. Going outside the ranks of automobilists for a president conveys some unpleasant suggestions.

The Necessity of Racing Revision.

At last the hybred racing rules inflicted on the automobile public in a bygone age are to be revised, Americanized and brought up to date. A heritage from a former controlling body, based on the French Jockey Club rules governing horse racing; rambling, vague, inconclusive and provocative of dispute and protests, they have survived until now, despite the fact that they never were useful, far less satisfactory.

Again and again the absurdity of this conglomeration of words dubbed "rules" has been acknowledged and a revision promised. But nothing that could be dignified by this name has ever taken place. As a result whatever progress racing has made has been in spite of rather than with the help of these rules.

Now, however, the sponge is to be passed over the slate, the present rules expunged and new ones adequate for the purpose framed.

With the assistance of the large calibred men who have the matter in charge, the endeavor is certain to be crowned with success.

The Week After.

After the show was over, after the strain was removed, then came the reaction most natural, when the lists of the sick ones waxed fat and no one would work lest he had to, and even they funked at that.

This has been the week of the Big Weariness for all and of the Big Loaf, for such as could take it. Those who could not lay up and recuperate recalled the proverb that "half a loaf is better than no rest," and shirked the best they could.

Everywhere in the trade was heard the same story of unmitigated tiredness, and more than a few actually took to their cots and called the doctor. President Shattuck was reported to be ill at home early in the week. At the club it was just about as lively as in a hospital, and even in the haunts of the newspaper men, who are supposed never to tire, there was a strange lethargy. Automobile news was not wanted. Rest was the sole damnd.

It was ever thus, but cheer up; the show, like Christmas, comes only once a year.

Law-Tinkering Rampant.

With the assembling of legislatures the automobile comes to the front, but in an undesirable manner, i. e., as the subject of restrictive legislation. Already two States—New Jersey and Connecticut—have moved against it, and a third, Pennsylvania, will shortly follow their example. It is well known that this State is to witness a battle over the infamous Cocks law, in which the entire ground will be gone over, and, it is hoped, a reasonable basis of legislation agreed upon. Massachusetts and other States are known to have bills impending or amendments to present laws.

Altogether it is plain that both the foes and the friends of the mechanically propelled vehicle are awake to the importance of a settlement of their differences. The bitterness of the former has somewhat abated—or perhaps it is only slumbering—but there can be no doubt that oppressive measures will be advocated by them. On the other hand time works in favor of the automobile. It is much stronger to-day than it was six months ago, and a quasi-friendly feeling has been developed among people formerly indifferent or hostile, but now mildly interested.

It is as certain as the day that if injurious legislation can be prevented this year it will not be enacted in the ones to follow.

As thirsty as Sahara's sands are many persons who are entering the industry or pastime at the present time for knowledge regarding the automobile. Its construction and practical working are being studied with the keenest interest all over the country by people who have turned students for the nonce and are determined to master the intricacies of this—to the superficial observer—intricate modern locomotion development. It is not difficult to foresee the end, nor will it be long coming, so rapidly are the students learning their tasks.

Lost, Strayed or Stolen—Several unwritten manuscripts by W. K. Vanderbilt, Foxhall Keene and Wilberforce Jenkins; also several undrawn cartoons by Homer Davenport and others, dreamed of for use in an "automobile daily." One large gilded brick, or $1,000 (stage money), will be given for their discovery and conviction. Address, Evan Escent Coughscwartz, care White Steal Champagne Co., New York.

While reflecting on the great growth of the vertical engine it is well to bear in mind the fact that the horizontal ones in use greatly outnumber them. In stationary engine and launch work the horizontal type is almost universal. But in France, where it was once a great favorite for automobile work, it has almost disappeared.

In buying a horse the first place examined is his mouth—the only part of his internals that is accessible. In buying a second hand automobile the "innards" are no less important. There are more of them, and, what is more to the point, they can be got at. They tell the tale of value as nothing else can.

Tubular frames have lost ground visibly. On the heavier cars they are now rarely seen. Reaches, too, are even worse off. A year ago they were a factor; now they are seldom seen.

"DOOLEY" AT THE DINNER

Makes his Appearance in a Runabout—Song he Sang and the Others who Spoke.

An electric runabout, rolling along under the power of its own motor in the big ballroom of the Waldorf-Astoria, was an innovation at the annual dinner of the Automobile Club of America, held last Saturday night, that took everyone by surprise. Yet this was not all of the treat of unexpected originality enjoyed by the guests at the dinner. From the electric car stepped a "Mr. Dooley" in costume, and sang a paraphrased version of "Mr. Dooley," adapted to fit or burlesque the leading personalities present. It was Will T. Carleton, the actor, who impersonated the famous creation of F. P. Dunne, and the song that he sang was:

Oh! Shattuck is a President who never can be beat,
At least by anything around that travels on four feet.
The auto-crat of Auto-Town, chauffeur of high degree,
To whom the amateur and "fesh" must bend the humble knee.
Says Mr. Dooley, says Mr. Dooley,
I've told friend Shattuck what he ought to do;
Stick tight to Panhard; get down to hard pan,
And rule like Mr. Dooley—ooley—ooley—oo.

Dave Morris, Astor, Vanderbilt, those chauffeurs gay and game.
Dispute with Bostwick, Bishop, Wright, your laurel wreaths of fame.
True sportsman's blood is theirs, my boys, tingling to flying heels;
But running faster as they steer some "Devil's" flashing wheels.
Oh! Mr. Dooley, Oh! Mr. Dooley.
From hayseeds and clam-diggers give 'em rest;
What seentence crueller: "Ten or the cooler?"
With Mr. Dooley—ooley—ooley—oo.

Soon will our autos fly the air, and sail around the moon.
'Twill be because on public roads they can't find elbow-room.
Lacking the pull of politics and graft of corner heeler,
You will not dare go round with Berg in hansom or four Wheeler.
, Like Mr. Dooley, like Mr. Dooley.
This island's owned by drays and trolley tracks;
"I've got a free hand" shouts nervy Vreeland,
To poor old Dooley—ooley—ooley—oo.

Chauffeurs are bold, we're often told, for right ahead they forge;
But they never yet cried "Out of the road!" to grand old Father George.
Still Cantor says G. W. must clear his statue from subway,
Pick up his duds and make a move about the 1st of May,
Unless Mr. Dooley, Mr. Dooley,
Prevents this awful, sacrilegious crime
And winks to Cantor "You surely banter!"
Or scoot with Dooley—ooley—ooley—oo.

Oh! Mr. Dooley, Oh! Mr. Dooley,
The swiftest man the country ever knew;
He's auto-cratic, yet democratic,
Is Mr. Dooley—ooley—ooley—oo.

Carleton was costumed in a County Galway coat and high hat and a yellow waistcoat, sprinkled with green shamrocks. The runabout was whirled about the aisles to the dismay of the waiters until suddenly W. E. Scarritt, dressed as a country constable, appeared and arrested "Mr. Dooley" for running backward faster than the law allows. Mr. Scarritt had on a pair of whiskers from which the hayseed dropped, he wore a long linen duster and carried a billy and a warrant, which he said had been issued by "Journalist-Justice" Wallace, of Hempstead.

This all happened after President A. R. Shattuck, acting as toastmaster, had made his preliminary remarks, and State Senator W. W. Armstrong and Simeon Ford had made their addresses.

It was the most largely attended dinner ever given by the club, about 350 persons sitting down to the repast, which was as fine as it should be at $10 a cover..

At the speakers' table sat Winthrop E. Scarritt, Elliott C. Lee, Willard A. Smith, Simeon Ford, Colonel Albert A. Pope, Colonel John Jacob Astor, the Hon. W. W. Armstrong, the Hon. Theodore F. Kluttz, President Albert R. Shattuck, the Hon. J. P. Allds, W. Pierrepont White, Job E. Hedges, the Hon. Edward A. Bond, Charles E. Adams, J. A. Ockerson and W. T. Carleton.

President Shattuck, before introducing the first speaker, told of the growth in automobiling and the good-roads movement which it had caused. He said that a bill had been introduced in Congress to appropriate $20,000,000 for good roads, the money to be distributed in accordance with the population of the State. Under that rule, he said, New York will receive as its share $2,000,000 on condition that the State appropriates an equal amount. If the bill goes through, he said, the United States will have 5,000 miles of splendid object lesson.

State Senator W. W. Armstrong, of Rochester, the first speaker, owned up that the only automobile he possessed was a little tin one.

He said the day is coming when an automobile will be able to traverse good roads all over the State.

Simeon Ford was the next speaker, and his remarks caused much merriment. For nearly an hour Mr. Ford kept his hearers in a constant roar of laughter. General Roy Stone, Colonel Albert A. Pope, Theodore F. Kluttz, State Senator J. P. Allds, W. Pierrepont White, Job Hedges, Edward A. Bond and J. A. Ockerson also spoke.

Three A's New Racing Board.

The new race committee of the American Automobile Association for 1903 is composed as follows: W. J. Stewart, chairman; Windsor T. White, H. S. Harkness, S. A. Miles and A. R. Pardington.

PATCHING THE SPEED LAW.

Shattuck Makes Suggestions at Albany and Finds Governor Fairly Disposed.

During the week of the show President Shattuck of the Automobile Club took a trip to Albany, and on Wednesday, together with Congressman Townsend B. Scudder, of Hempstead, L. I., had a talk with Governor Odell concerning automobile legislation. Three proposed amendments to the Cocks law were submitted, two of which, it is said, found favor with the Governor.

One changes the speed requirement of eight miles an hour in corporated villages and twenty miles an hour in unincorporated villages to eight miles an hour within one mile of a postffice. Sign posts are to be placed designating the distance to the post-office.

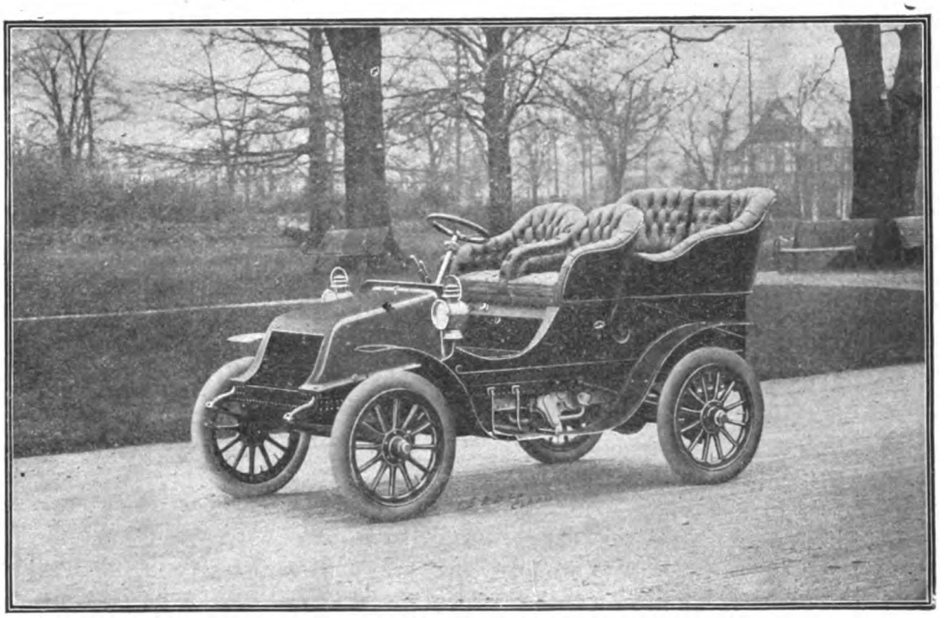
The second makes an automobilist's failure to stop on signal a misdemeanor instead of making him liable to a civil action for damages.

The third amendment, which is still in abeyance, provides for the licensing of all professional chaffeurs. If a chaffeur violates the law he shall be liable for suspension on the first offense, and on the second his license shall be revoked.

For a Speedway in Florida.

A movement is on foot to establish a speeding ground for automobiles on the famous Daytona and Armand beach in Florida. This stretch of sand is about thirty miles long and as hard and smooth as a billiard table, and would be the best place in America, probably in the world, for making straightaway records of a mile or more. The last day of the automobile show saw the inception of the Florida Automobile Association, having for its purpose the development of the big beach as a speeding ground. The organization has the co-operation of certain officials of Southern railroads. The idea is to arrange annual tours to Florida for automobilists and a week-long tournament of racing on the beach in March. A committee of the new association is to go to Florida in a few days to test the beaches and arrange the details for a tournament during the second week in March.

Mournful Meeting of Motor League.



A small attendance marked the annual meeting of the American Motor League, which took place on last Thursday afternoon in the concert hall of Madison Square Garden. After listening to the reports of the retiring officers, the election of new ones was proceeded with, and resulted as follows:

Isaac B. Potter, New York, president; Charles E. Duryea, Reading, Pa., first vice-president; W. G. Murray, Chicago, second vice-president; F. B. Hill, Boston, treasurer, and S. W. Merrihew, New York, secretary.

Resolutions were introduced protesting against the bills now before the Connecticut and New Jersey legislatures hostile to automobilists. An adjournment was taken to the Chicago automobile show.

$2,500

WILL YOU

pay two thousand, five hundred dollars for a genuinely good automobile which represents the present highest standard of excellence in design and manufacture?

If you do not appreciate the vital difference between superficial perfection and construction that is honestly good and thoroughly scientific from wrist-pins clear out to the last coat of finishing varnish, then you will not be especially attracted by the new twenty horse-power

WINTON TOURING CAR

We hope, however, that you will recognize our latest successful efforts and accord this new model the consideration it deserves. You who have been conscious of the rapid development of the successful American automobile, who have watched it through its various stages since the time—years ago—when Mr. Alexander Winton ran upon the roads his first "horseless carriage," will recognize the great strides we have made toward the goal of perfection in automobile building, and can appreciate in no small sense the genuine pride we feel in this latest triumph.

It is not intended as a "sensation." It does not incorporate a vast number of rare features for which we, in justice, can claim no more than theoretical excellence. Its construction does not embody a vast number of untried experiments, and we do not, therefore, ask anyone to share in a manufacturer's gamble. In presenting this model we give the very essence of practical and thoroughly tried out experience.

Consider the matter of delivery: During the current season we will be able to manufacture just one thousand of these twenty horse-power Winton Touring Cars. A liberal percentage of the total output has already been sold. Supply will not meet the demand, of this we are quite sure. Would it, therefore, not be an act of wisdom to file your order early and allow some one else to be disappointed as the result of procrastination?

TENDENCIES, IMPRESSIONS AND QUESTIONS DEVELOPED BY THE SHOW

The impressions or lessons of the show?

The casual observer at the show probably carried away impressions of the general appearance of the machines and their growth "in size," appointment and finish, as there is no doubt but that the tonneau touring car of all sizes, powers and prices is both popular and impressive. These are not limited as heretofore to gasolene cars, but include the steam and electrics, and naturally these are the cars which appeal to the novice.

The more interested observer might ask why the tonneau type is so much in vogue. Has it been adopted for its æsthetic points of excellence, or is it possible that the arrangements of mechanical parts permitted by the tonneau has caused its almost universal adoption?

There is no question but that both influences are at work, and it must be admitted that the tonneau has points of supremacy from a mechanical standpoint. With it the complete chassis is the strong feature. This is admitted even by the steam manufacturers, who are adopting the general lines of construction and make their heavier touring cars conform to the general standards of the gasolene tonneaus.

To the careful observer and student of the show this certainly is not the predominating feature of advantage in automobile construction, although the steam manufacturers in adopting the tonneau have certainly made the greatest departure from practices heretofore adhered to. By doing so they have been able to make improvements hitherto practically impossible. The compound engine of the White car mounted under the bonnet and with its condenser at the forward end in place of the ordinary cooling coil of the gasolene machine is certainly an instance of the sort, and bids fair to be a type of steam car which will attain marked reputation. The complete chassis has also been adopted by Grout Bros. and the Locomobile Co. In fact, the whole general tendency of the steam vehicle is toward simplicity, economy in operation, great accessibility and the perfection of all delicate parts with increase in speeds and weights. Details of engine construction are more carefully worked out and conform to the best steam practice. The wheel bases have been increased in length, and wooden wheels with heavier general construction will naturally follow on the steam touring car. Even the light runabouts will hereafter assume the general lines of the gasolene car if only by the adoption of box dashes for lockers or enclosing an extra seat. The water and air pumps will be of the steam operated type, with either automatic or hand control arranged in more accessible positions and of improved type. The Mobile Company of America had the most unique arrangement of this part of the mechanism, and provide both a steam operated water and air pump driven from the same crank shaft and provided with a crank when it is necessary to use them as hand pumps. These are located on the inside of the dash in a most accessible position. The Locomobile Co. arrange their pumps directly under the footboard, where they may be reached by raising a trap. It is not to be inferred that the light runabouts will not continue to be popular, but it might be predicted with almost absolute certainty that the heavier type with compound engines, condenser and every accessory used in the best steam practices will become more and more popular. The Mobile Company have the most ingenious form of regulator for the boiler water. It is a counterbalance, positive in its action and dependent for operation upon the evaporation by steam of a small quantity of water which ordinarily keeps the regulator in balance.

The exhibit of the steam fire engine of the International Fire Engine Company illustrates the possibilities in steam practice to quick acting machines of large power designed to be handled by men conversant with the steam engine. The absence of steam operated trucks and fewness of delivery wagons would indicate that steam will not be popular in this class of machines; in fact, there is little to expect in the delivery line outside of the electrically propelled vehicle.

Electricity certainly has its best foot forward, so to speak. Nothing could be more beautiful or perfect in operation than the light electric runabouts of the Baker, Ajax, Columbia, Studebaker and the others. Their control is flexible, yet positive, and they may be handled with impunity even by a novice. To be sure they are not touring cars, and will never be used for touring purposes; but for light city use and for traction purposes they will undoubtedly grow to magnificent proportions. Although the electric vehicle was one of the first in the American field, no very radical departures in general practice were brought out at this year's show. There are, of course, tendencies, and these, generally stated, are along the line of perfection. Motors are being more condensed and made of greater efficiency. The general movement is toward simplicity, increased capacity of operation and as low weights as are consistent with the required practice. Ball bearing motors are popular on the light runabouts, and these in almost every instance use the chain drive to a divided rear axle. The disappearance in many cases of the under running gear with reach construction indicates that the reachless gear will probably meet with favor. The underslung battery on heavy vehicles solves the problem of securing full body space, giving very low weights and obviating all troubles from acid slop. The divided battery will also be popular in the tonneau cars, and gives distribution of weights over both axles which is almost essential. In the matter of commercial vehicles, the adoption of electricity is assured, for heavy trucking particularly. There is no question but that with the limited speed of these trucks and their ease of control they are the only ones which can be intrusted to drivers of ordinary skill and average comprehension. No matter who is the man, if he is given comparatively high speeds and high powers he will abuse them, and will have trouble in operation. With the electric vehicle there is little for the operator to do except use his controller lever with ordinary discretion and see that his batteries are on charge as often as convenient. For truck work the batteries may be kept fully charged by simply inserting the charging plug whenever the vehicle is standing before the warehouse. Controllers are being very much simplified, and are of the rheostat type to a great extent. The electric vehicle is certainly becoming more popular, and with it an unusually quick control of the vehicle may be maintained. As yet the Exide battery seems to be the prevailing type, and is almost universally used.

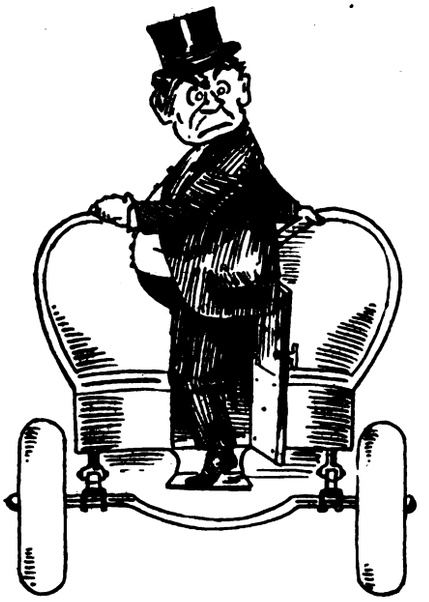
The entrance of the great Westinghouse Manufacturing Co. to the automobile field assures an unusual growth for the electric vehicle. This company, one of the largest manufacturers of electrical apparata, are designing special motors and all necessary equipment of the electrical sort for vehicles. Their product will without doubt be of the reliable and substantial sort, which has secured success in the electrical field.

Without doubt the greatest advance in the automobile art is in the gasolene car. It certainly is featureful, and although the reports of the Paris show echoed here indicated marked improvement of the foreign car, the New York show proves that American manufacturers have not only assimilated such advantageous features of the foreign built car as were necessary and desirable, but have improved on the details of foreign creations.

Generally speaking, there is a distinct ten-

Digitized by Google

dency toward greater accessibility. Of course the four cylinder upright type of engine is a predominating feature of new big cars, and with the sliding gear transmission and automatically controlled engine gives a vehicle control of unusual elasticity. The complete chassis is, of course, the vogue, and by its use all parts of the mechanism may be disposed to the best advantage, and in the most accessible positions. It would appear that the foreign builders are not quite up to American standards in this respect. The latest American builders are placing their valves and igniter plugs where they may be removed and inspected in an instant.



Slow speed engines are the rule, and the automatic regulation of the engine is assured. American builders of touring cars almost without exception will use some form of automatic governing, probably the ball type, and will govern either by controlling the lift of the inlet valves or by throttling. In some instances the ignition is governed automatically and simultaneously with the throttling, but in any instance of automatic governing the accelerator will play an important part. What could be more ungainly than the racing of a four cylinder engine when the gear and clutch are thrown out? There is no necessity for it. The governor will take care of engine speeds up to certain limits, and by combining with it a hand operated adjustment or correction for the governor and ignition the speeds of the vehicle may be readily accelerated. Except on the lighter vehicle of the runabout type, the planetary system is on the decline and the sliding gear with single lever control and direct drive upon the high gear is being almost universally adopted.

The divided rear axle is again a bone of contention among gasolene vehicle builders. Much is said for and against it both when used in connection with the driving chain or with a universally coupled shaft and bevel gears. The divided rear axle has certainly not yet taken the place of the countershaft and individually chain driven wheels. On the contrary, notable improvements have been made in countershaft constructions. Wherever possible the parts are made interchangeable, and drop forged squared couplings are used between the differential and the driving sprockets. The gear cases must have some support, and why not support them on the countershaft, giving it all the necessary strength of support and enclosing all of the driving mechanism except the sprockets and chains?

While the four cylinder upright type of motor is popular on the heavier cars, the horizontal engine is, if anything, gaining on lighter cars of the runabout type, and in one instance a double cylinder two cycle motor is to be found. These all point to a general advancement of the light runabout, and it can almost be stated with warrant that while the heavy touring cars are for the time popular and the predominating feature, it is but a question of time when American practice, urged on by the general demand, will produce light runabouts of the gasolene type, which will be low in price, in weight, and will have little, if any, complications. The most fascinating work in the gasolene vehicle will be in the production of the light runabout. Its details will assuredly be worked out to a nicety, and every part will be made as nearly as possible interchangeable, and as of compact and light form as will be consistent with the duties and work demanded of it.

The furore created abroad by the mechanically operated inlet valve, which was echoed here, had all its substance removed by the show here. The number of American builders who are employing valves of the sort was clearly brought out, and amazed even many in the trade. In one marked instance the maker even dispensed with the ordinary cam method of opening the exhaust valves. This is on the Columbia car. In place of the ordinary cams, eccentrics are used, which open and close the exhaust valves with positive movements, there being absolutely no pounding and consequently no noise. With the present lines of engine construction in view, it seems very doubtful that the mechanically operated inlet valve will be universally adopted. All makers are placing their valves in accessible positions; they are well made, ordinarily kept cool, and there is little liability of their sticking; but even if they do, their stems usually protrude through the engine casing so that they may be "tickled" and released.

Those Doll-Size Doors.

During the show it was abundantly demonstrated by the discomfiture of many that there is as much truth as caricature in this illustration. The doors of some of the touring cars were apparently designed for dolls—and it did not require a particularly plump person to "stick" in them. The antics of people in such positions was a source of no little amusement.

The carburetter situation is another much mooted question, yet a careful examination of the entire show indicates that the float feed type of carburetter is that most generally adopted. To be sure, in some of the smaller vehicles a "Phœnix" type, using a baffle plate and needle valve, which operates the oil vent on the suction stroke, but these were isolated instances. There is one feature of the carburetter, however, which is evidently new and is bound to stay. It is the so-called compensating type. The Berg car has one of the most perfect examples, and, of course, while using the float feed and mixing chamber it also provides a means of automatically varying the inlet area connecting direct with the atmosphere as the position of the throttle and consequent speed of the engine is varied. On the Berg the compensating carburetter is connected up to the engine governor, which is of the ball type. Several different methods, varying slightly in construction, are used by others, securing the same general result. An ingenious form of compensating device is that used in the Electric Vehicle Company's gasolene touring car. A direct air inlet is normally closed by a counterbalanced vein and is swung backward and forward to a greater or less degree dependent upon the suction of the engine.

The reinforced wood frame in the chassis constructions will undoubtedly give place to the angle or channel iron frames of comparatively light yet rigid construction. The general tendency for the coming year's business is indicated, so far as gasolene machines are concerned, by the very radical departure of the Packard Company. Formerly they were close adherents to the horizontal motor, now they exhibit a most perfect type of four cylinder upright motor, a complete chassis, and well worked out driving mechanism throughout. Of course there is no doubt that the Linousine type of body or its equivalent, the canopy topped tonneau with glass front guard, will become popular. For touring cars there should be increased demand for vehicles in which the occupants are somewhat closed in and protected in extreme weather.

The marked preference for the honeycomb type of cooling coil, used in many instances for forced circulation of air induced by a fan, and the tendencies toward wheel steering, wood wheels and detachable tires were so apparent as to scarcely require remark.

Trainload of Exhibits Shipped West.

A special freight train of fourteen cars, placarded with the names of the automobiles they contained, pulled out of New oYrk City on Tuesday morning, en route for Chicago and the show that opens there on February 14. It was the train specially chartered by the N. A. A. M. to carry the exhibits West from the New York show. The schedule for the train included stop overs at night at Albany, Syracuse, Buffalo and Cleveland. Four cars will be dropped at Cleveland.

The Show a Gigantic and Unmarred Success

Large Attendance and Unexpected Heavy Sales Leave Every One Satisfied and in Good Humor · What the Exhibitors Report.

What was unquestionably one of the most successful and impressive industrial shows ever held in this country came to an end at Madison Square Garden on Saturday night. A considerable measure of success had been looked for; but it proved to be entirely inadequate. From the opening of the show until its end the tide rose and swelled, until it set a mark so high as to seem beyond the reach of any subsequent one.

Everything necessary for a successful exhibition was there. No such showing of automobiles, parts and accessories has ever been seen here. It was marvellous, a revelation of the progress that has been made in fifteen months, and even more significant as an indication of what is to come. As if in recognition of its astonishing character the trade and public poured into the Garden from one Saturday night to the next, both bent on business. Consequently sales were made at a rate almost undreamed of previously, and the trade received a fillip that will spur it on to fresh and hitherto unheard of exertions.

No one expected such an out of town attendance as was present. The hotels were overrun with applicants for rooms. Only Horse Show week afforded a parallel for it, and the most popular class of hotels filled early and were obliged to turn applicants away.

Figures showing the paid attendance each day tell the story eloquently. There were 30,292 paid admissions, as follows:

Saturday, January 17	1,773
Monday, January 19	3,432
Tuesday, January 20	4,522
Wednesday, January 21	5,006
Thursday, January 22	5,483
Friday, January 23	5,165
Saturday, January 24	4,911
Total	30,292

There were in addition some 14,000 trade and complimentary tickets sold and issued, the bulk of them being the former, thus bringing the total to nearly 45,000. At the last show, in November, 1901, the attendance was less than one-half this.

Of this attendance the most remarkable part was that of tradespeople. They came in droves. Day after day they thronged the Garden and besieged the booths of exhibiting concerns. Old agents wanted to renew contracts, new ones begged to be allowed to enroll themselves. All were clamorous for automobiles. City and country vied with each other in the endeavor to obtain an adequate supply. Some were obliged to depart unsatisfied; but the majority met with better fortune.

All along the line the story of excellent business done is the same. No exhibitor with novelties or meritorious goods lacked for customers. Before the week was over there was almost an embarrassment of buyers, and assertions of outputs sold were frequently met with. The buying was not confined to dealers in automobiles, etc., but embraced the outside public—the individual users—as well.

From a round of the show during Saturday afternoon and night made by Motor World representatives, the appended impressions and expressions of opinion were obtained:

Thronged as the entire Garden was, it seemed throughout the week as if the crowds in the restaurant were bigger than anywhere else. The magnificent exhibit of Columbia vehicles, made by the Electric Vehicle Co., was, of course, one of the chief centres of attraction there, and it is not easy to determine whether the electric types or the new gasolene car received the most attention.

Certain it is, however, that the latter, one of the noteworthy cars of the show, was critically examined; and equally certain that it elicited only encomiums. Whether viewed as a whole or in detail this was true. The many ingenious devices, designed to add to the efficiency or convenience of the car, were commented on, and the attendants were kept busy showing and explaining the hand removable valves and spark plugs.

The company has every reason to feel satisfied with the material outcome of the show. Sales aggregating a very large amount were made, all classes of vehicles sharing in this popularity. President Day and Secretary Budlong expressed themselves as being highly pleased with the result.

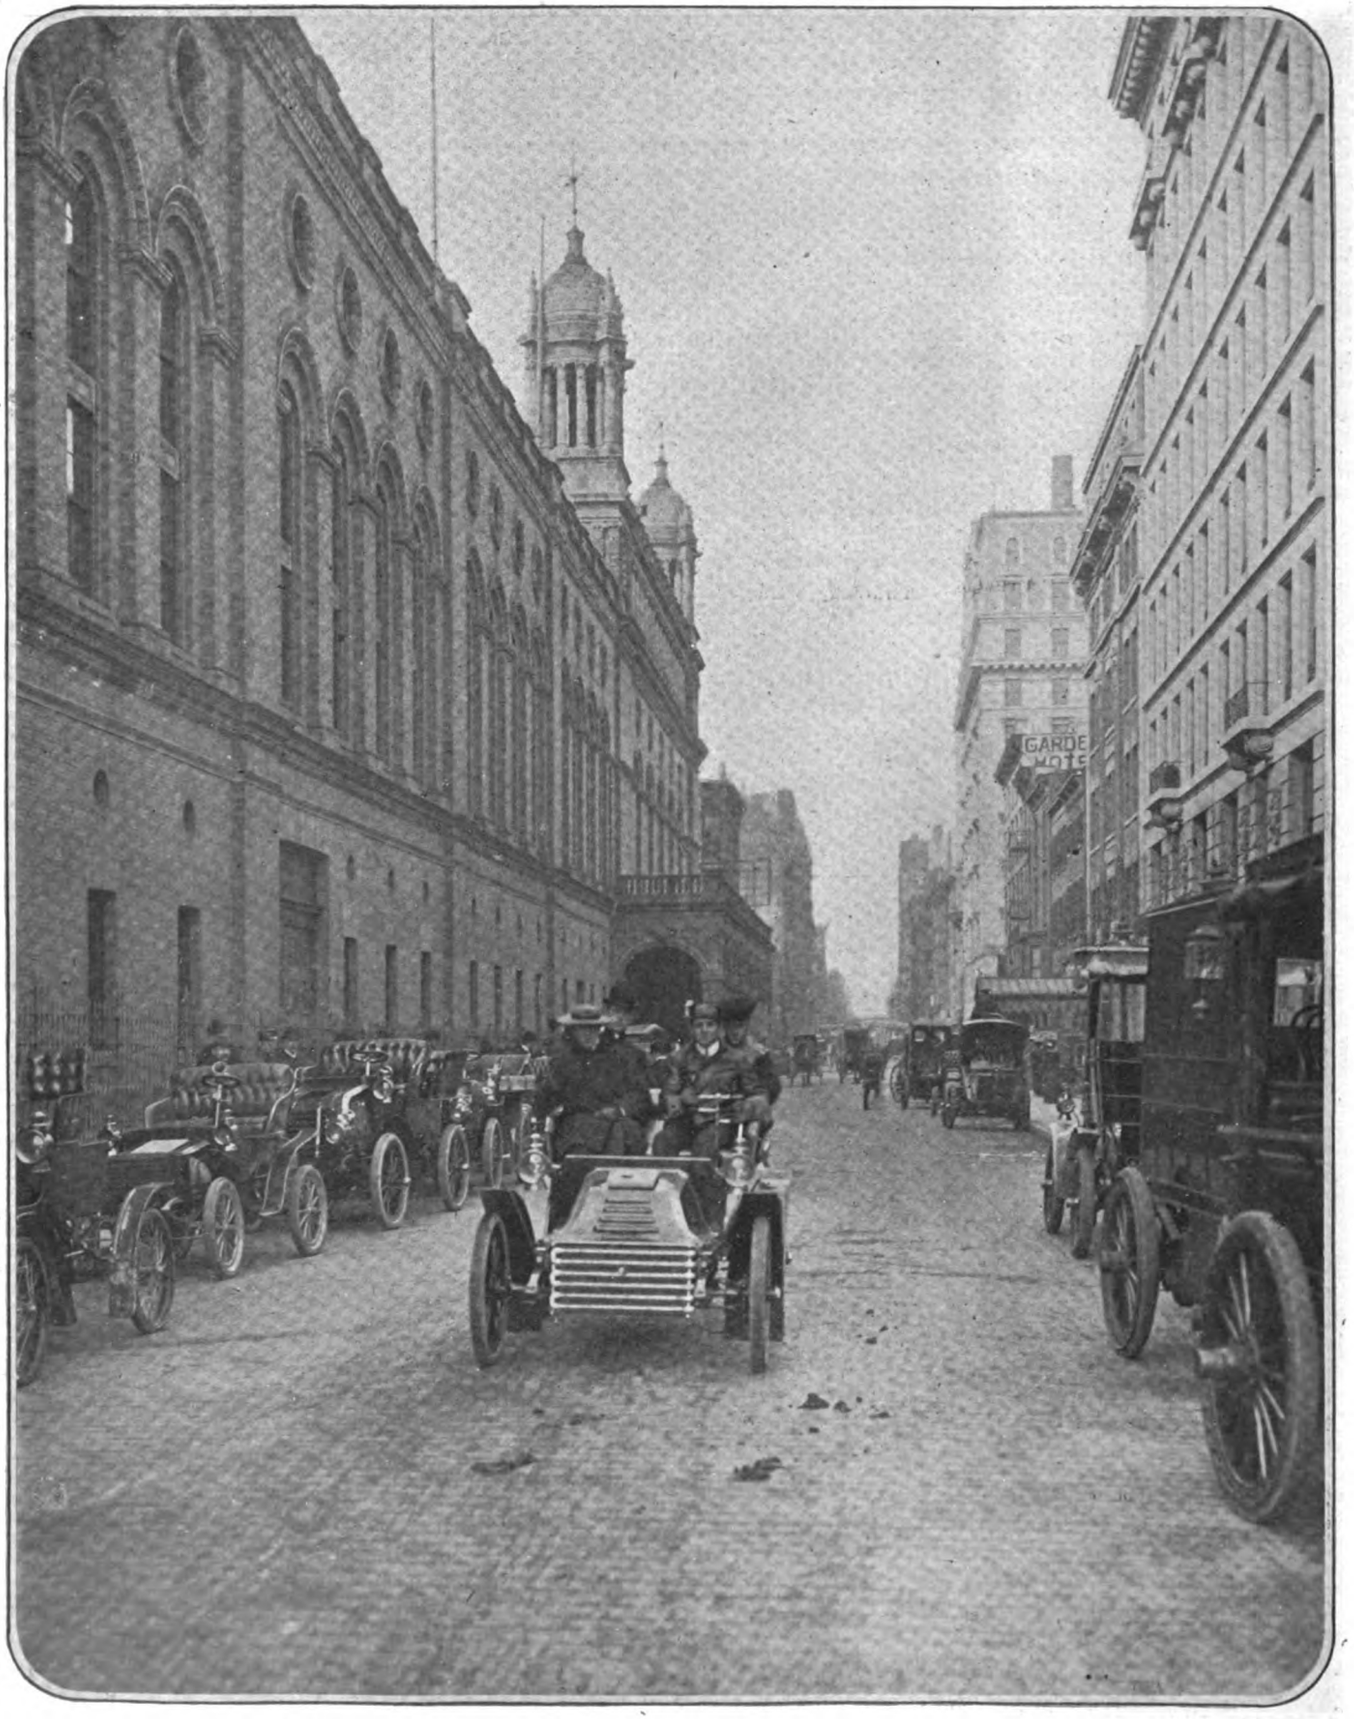
Success of a pronounced character rewarded the efforts of Thomas B. Jeffery & Co., makers of the Rambler touring car, to bring home to show attendants the merits of their new model. "Factory output sold," was the familiar cry before the week was over, and in this case it was based on fact. The concern had to refuse orders, and from now on the entire factory efforts will be devoted to turning out cars enough to fill the orders already in hand.

"Our only trouble now will be to get the goods through the factory," said T. B. Jeffery in confirmation of this. "We have sold all we can possibly make, and could have sold double the number."

"We have sold 400 cars here, and could have made it 1,500 just as easy," confirmed Sales Manager Bennett. "In fact, it would frequently have been less trouble to take orders than to explain that we had none to sell. Each order has been accompanied with a deposit, as this is the only way we do business."

Even when the jam seemed thickest in the Garden there was one stand where it was worse than anywhere else. This was at the Olds booth, the "daddy" of runabouts having, if anything, grown more popular than before.

The Oldsmobile chassis was, of course, a centre of attraction. When early in the week a belt was attached to the flywheel and the engine run slowly by means of a dynamo, it became a difficult matter to get near enough to it to examine it, so great was the eagerness to see a model gasolene engine in operation.



The slow running enabled an excellent view of the engine to be obtained. The action of the valves—both the intake and exhaust being actuated mechanically by two cams mounted on the same secondary shaft was so simple that it could be seen at once. Second only to the chassis in interest were the Olds tonneau and physician's car. They were examined by large crowds throughout the week, and received much favorable comment. The Olds souvenir, a stickpin having mounted on it a miniature Oldsmobile, was eagerly sought and given out freely.

In the matter of sales the Olds record was a remarkable one. As officially given out, they comprised 3,500 cars of the runabout and 450 of the tonneau type, or considerably in excess of $1,000,000 worth. In the face of such an impressive showing the emphatic success of the show cannot be questioned.

"Well, after looking over all the novelties in improved and complicated construction I'm back to buy a Winton. There are a lot of splendid cars here, and it stands to reason that many of them are all right and will stand up. At least I think so; but with the Winton I know it is all right. It has been proved reliable year in and year out, and when I get it I feel satisfied that I am taking no chances. It has improvements enough and is a sure stayer."

A Motor World man overheard a man

Digitized by Google

THE DEMONSTRATING CARS OUTSIDE MADISON SQUARE GARDEN.

Digitized by Google

speaking substantially as above to Percy Owen at the Winton space, and later he asked Owen if he had many customers like that.

"Bless you!" answered the ever pleasant Owen; "they come here just that way every day. It is an old and familiar song to us now, that one. It is natural that it should be so, too. Don't you recognize the fact? We were pioneers in the field, and have kept to the front. The speed and stability of the Winton have been demonstrated in so many hundred different ways that it would be strange if persons did not come to regard our product as standard."

Naturally the Winton space, with the record holding "Bullet" and "Charley" Shanks and Percy Owen and Alexander Winton himself there, was a centre of interest day and night. The public eye, caught and focussed by the genius of Shanks, was kept upon the Winton cars all the week, and if the concern had wanted to permit of speculative dealings in the vehicles there is no telling how many cars might have been sold. The Winton policy, however, is opposed to selling in quantity to agents who want to speculate on deliveries. The idea is to protect the public from the exaction of premiums. As Percy Owen put it: "We do not deal with agents, so far as letting them place orders ahead is concerned. Those who want to buy have got to have a bona fide cash customer ready for every car. This is pretty near to retailing, and yet we sold 150 cars during the week; those cars, you understand, are to go directly into commission. They are not to form stocks for any men. They are to go direct to the consumer, or from an agent direct to a customer who is waiting."

In spite of all the talk of racing that was buzzed into his ears, Mr. Winton found abundant time to explain the details of the new touring car, and if the mechanism of any car in the show was set forth more lucidly it was not discovered.

A show without an exhibit of "Baker Beauties" would be almost like "Hamlet" with the melancholy Dane left out. The usual admiring comments upon the clear cut lines and superb finish of the Baker electrics were heard throughout the week, and were frequently followed by more substantial evidence of approval.

"We are very well satisfied with the show," said Manager Goss in reply to the Motor World man's question. "We have done good business, and a great deal of it. Just how much we cannot tell until we have rounded up. It has come from both the trade and the public, too, which is the gratifying part of it."

"There is only one thing we have to complain of, and that is too much business," was the exclamation of W. A. Richwine, of the Autocar Co. in reply to the stereotyped inquiry.

"We have sold all the cars we can make, and the demand is nowhere near filled. As you know, we sell our product to eight large agents, each of whom has considerable territory. We apportioned our cars among them, giving each as much as we could, and now they want the allotment increased. One of our agents is getting three cars a week through the winter. At the show he came to us and said he wanted six. Now, to give them to him we would have to take them from some one else, and how are we going to do that when the others want more cars instead of less?

"Here at the show we have been booking orders for our agents, and the number of these orders and the range of country covered by them show how general the demand is."

No one anticipated anything else than a superb exhibit from a firm of such national reputation in carriage building as the Studebaker Bros. Mfg. Co., but there was something even more delightful about the elegance and finish of these cars and the advanced features of construction in them than could possibly have been anticipated. The tubular frame, with its elliptical springs in the rear and the semi-elliptical springs in front, and the method of pivoting the rear spring to the frame so as to give freedom to the axle movement, was a constructional feature that made a hit with the mechanical sharps. The name of the concern itself, and the knowledge that it was their first appearance at a show, were enough to keep the space crowded. Two runabouts and two Stanhopes were exhibited, and orders for a total of 250 vehicles were taken during the week.

The one stand in all the show where the three different forms of power were offered, that of the International Motor Car Co., was like a beehive all the week. It was the refuge of both those who were "wise" and those who wanted to learn, because it was a space where all differences and virtues of the respective powers was explained without "knocking." Eleven machines were on show, one steam and four gasolene Toledos and six Waverley electrics. The gasolene vehicles were of two, three and four cylinders, and replete with striking improvements. Manager Schaaf had wisely divided the booth into two parts, with the electric machines taking one-half and the others on the opposite side. The four-cylinder car of 24 horsepower, with copper water jackets, with removable cylinder heads and valves that can be removed about as easily as a hood lid, attracted continual attention, and a Motor World man tried probably a dozen times without success to catch Manager Schaaf at leisure to have a chat. He did not know what leisure was during the entire week, and it was small wonder that on Saturday night he could report bona fide sales of 200 cars.

Novelties are always good drawing cards, as was shown at the White stand during the show. The steam tonneaus were undoubtedly the centre of attraction, although the delivery wagon and the time tested White Stanhope were far from being neglected. The stand was thronged all the week, and excellent business was done, both the trade and the user being in evidence. The gathering of the White forces was, as usual, an imposing one, including Windsor T. White, Manager Deming, of New York, and Manager Lowe, of Boston.

"Our sales totalled $300,000, and were pretty evenly divided between steam and gasolene," was the way Advertising Manager Kingman of the Locomobile Co. of America summed it up for the Motor World representative.

It was only necessary to watch the attendance at the Locomobile stand to obtain a good idea of the favor accorded the goods shown. In addition to the delivery wagon and other steam novelties, the limousene and canopy top gasolene cars were carefully inspected, and the way they bore the inspection must have been highly gratifying to A. L. Riker, who designed them and superintended their construction. President S. T. Davis, jr., was also a frequent attendant.

One of the first American makers to adopt the vertical engine in front type of car, the Peerless Motor Car Co., reaped the reward of their foresight last week. Their fine showing of modern cars, leading up to the 60 horsepower monster, attracted wide attention, and was followed by a more substantial result in the shape of orders. General Manager Kittridge and Messrs. Morrison of the Peerless company, and A. L. and G. A. Banker and C. G. Wridgway, of the three Banker establishments, looked after the visitors. The former stated that he was more than satisfied with the sales made during the week.

The Haynes-Apperson car has a clientele of its own, and no greater enthusiasts than they can be found anywhere. At the show, therefore, the exhibit of the well known Kokomo concern was an object of much interest. One of the oldest and most thoroughly satisfactory cars on the market, the changes made in this year's models seemed to hit the public taste. Consequently President Ellwood Haynes and his corps of assistants were kept busy during the week, and a gratifying sheaf of orders were in hand at the end to lend substance to the encomiums pronounced upon the cars.

Good lamps, designed on the most modern lines and pushed by such adepts as Messrs. Wells and Keck, could not do otherwise than sell readily, which is another way of saying that these gentlemen from remote Kenosha are entirely satisfied with the way Solar lamps "caught on" at the show.

Only a single car was exhibited by the Moyea Automobile Co., but it was one of the most admired at the show. It was as much as President Cryder and his corps of assistants could do to satisfy the curiosity of inquirers who wanted the features of the

Digitized by Google

car explained. It was a car for the connoisseur, although even the uninitiated could scarcely fail to be impressed by its thoroughly modern design and superb finish. Consequently, good business was done, and the car will undoubtedly find its way into the possession of users who are looking for something out of the ordinary.

No harder worked man was at the show than General Manager Van Wagoner of the Century Motor Vehicle Co. He was kept on the jump all the week explaining the good points of the new Century gasolene runabout and demonstrating its running qualities outside the Garden. The substantial appearance of the car, together with its low price, made it one of the best sellers of the show, a number of British orders being booked along with the domestic ones.

"We have sold our output, and more than that no one could possibly expect," said Secretary F. H. Elliott, confirming the report of good business.

That the F. B. Stearns cars are good value has become almost an axiom, and the attention they received last week proved that the fact was generally recognized. Big, powerful, comfortable looking- cars, the soundness of their construction was apparent. The factory capacity has been increased, but it will be taxed to meet the demands made upon it in consequence of the batch of fat orders that were secured at the show. The well known F. B. Stearns and Sales Manager McCrea departed from the show well pleased with the business that fell to their share.

"Pleased with the show?" repeated General Manager W. D. Gash, of the Searchmont Automobile Co. "We certainly are. We have sold a gratifying number of cars, so many that it will be all we can do to turn them out.

"We have made unexpected sales, too," he went on. "Now, here is an order for five cars from So-andSo," mentioning a dealer in a Western city notable for the number of its automobile makers. "We had no idea of securing representation there. But the dealer wanted our cars, and this is his signed contract."

For a concern making its initial appearance at an automobile show, and with a new car, the Kirk Mfg. Co., makers of the Yale gasolene car, did remarkably well. A considerable number of bona fide sales were made, and General Manager Ezra E. Kirk was jubilant over the result.

"We are delighted with the show," he said. "Why, we even sold the two cars we had on exhibition, their purchasers being determined to run no risk in the way of deliveries."

To many of those who visited the show last week the Darracq chassis was a revelation, just as it was one of the features of the exhibition. It made plain what a really modern French car is like, and cannot fail to extend the sale of the Darracq car in this country. Messrs. Cook and La Roche expressed themselves as pleased with the show, the latter stating that a gratifying number of sales had been made.

When Colonel Pardee started out to sell the output of American gasolene automobiles made by the American Motor Car Co., Cleveland, the task seemed a formidable one. The car was new and almost unknown, and it looked then as if the only trouble would be to make the selling end keep pace with the producing end. A few months of hard work has changed all this, however. The show evened up matters, and any further marked increase in sales will put the shoe on the other foot. In addition to Colonel Pardee, Engineer Dunham of the American company was in attendance.

The only two cycle engine at the show, the Elmore, naturally attracted a lot of attention. But that fact is not the sum and substance of its excellences, although the genial J. H. Becker never tires of extolling this feature. The car is a good looker, stanch, and reliable, and at the same time low priced. Not even its late arrival—for which the New York Central Railroad must yet answer to the irate Becker—prevented sales being made to a gratifying extent.

Over 4,000 toy automobiles were given away at the show by C. F. Splitdorf, they fairly dividing honors during the latter part of the week with the much talked of giant spark demonstration. The latter attracted wide attention, as, indeed, it could scarcely fail to do.

With soundly constructed goods to back this brave show, it is not surprising that business was done. Such was the case, C. F. Splitdorf being authority for the statement.

On price alone the General tonneau touring car woud prove a ready seller. It is not often that such a car, fitted with a double cylinder motor, retails for $900,and when, in addition, it looks well and acts well, the result is easy to prophesy. "Out of the first twelve demonstrations we gave outside of the Garden," said Manager Penning, "twelve customers were secured and twelve sales made. I need hardly say, therefore, that I am much pleased with the show."

To say that the new Packard car created a sensation is to simply state a fact. Messrs. Packard and Weiss were kept busy responding to congratulations extended them. Many who came to criticise remained to praise. But the old reliable models were not lost sight of. On the contrary, they were critically examined and sold freely. Advertising Manager Walden was one of the busiest men at the show—a large statement, but a true one. He did everything but sleep in the Garden, and never tired of explaining the merits of the Warren company's product. Good business was done in both the old and the new cars.

Good business is reported as being done in Northern cars, represented at the show by Homan & Schulz. Sales Manager Gunderson, who was in attendance, expressed himself as being decidedly pleased with the result. The fine appearance of the Northern, combined with its low price, makes it an attractive proposition, and one not apt to be overlooked. A. T. Fuller, Boston agent for the Northern, was also in attendance.

There were no long faces at the Waltham stand on Saturday night. The new Orient buckboard scored a popular success, its sales being so large that a halt was finally called. The new touring car was also a good seller, and General Manager Gaylor expressed himself as being highly pleased with the net result of the week's selling.

With runabouts at $750 and touring cars at $1,250, it is not surprising that the Conrad gasolene cars, made by the Conrad Motor Carriage Co., should "catch on." It did, and a goodly number of sales resulted, traceable directly to the many excellent features possessed by the cars. President Conrad, Secretary Puget and Sales Manager Olmstead were all in attendance, and were kept busy looking after the host of interested inquirers who thronged the booth.

Berg cars made a hit, and before the week came to an end President Berg stated that the entire output was sold, and it had been decided not to show at Chicago in view of the inability to accept further orders.

The plan of selling the chassis alone, giving the purchaser the option of selecting his own carriage body, "caught on" at once, and the policy bids fair to be adopted by a number of other concerns.

In view of the career of the Stevens-Duryea car in the recent past, it was only natural that it should attract much attention at the show. With this initial advantage, and such a strong factory representation as President Page, Superintendent Duryea and Sales Manager Hildebrand to look after it, the satisfactory business resulting was fairly to be expected.

The drawing power of parts or fittings in motion was strikingly shown at the Veeder stand. Odometers run at an astonishing velocity by dynamos, and the new Tachometer proved magnets that drew crowds. The latter is a distinct advance in speed indicators, and the attention given them demonstrated that their merit is recognized. D. J. Post was in charge of the exhibit, as usual.

The aggressive policy conducted by Grout Bros. has borne good fruit. Their great courage in producing such a radical innovation as a steam tonneau was recognized and rewarded last week. The car that stood for the modern idea in steam construction—the tonneau already described and illustrated in these columns—was the cynosure of all eyes.

Digitized by Google

Its clean cut lines, with brass tube protectors for the condenser and other delicate mechanical parts, which caused it to be dubbed the "locomotive," compelled approving comments, and must have done much to warm the cockles of the hearts of the Messrs. Grout, both of whom were present. This car, and also the regulation steam models, which have met with such a ready sale abroad, as well as here, met the taste of steam vehicle users, and some very gratifying contracts were booked as a result.

Some interesting features reveal themselves on a close inspection of the tonneau car, which is claimed to have been the first one produced, although one of another make had been pictured the previous week. The throttle is attached to the steering rod under the steering wheel, and consists of a wheel a size smaller than the former and directly under it, arranged to slide up and down on the steering rod and locked by a foot latch in position. The device is a most ingenious and mechanical one. The reverse is by foot lever instead of the usual hand side lever.

The boiler is placed in front under the bonnet, while the engine is positioned horizontally under the footboard. The drive is by individual chains from a counter shaft to the rear wheels. The boiler has a fusible plug, which prevents the burning of the boiler.

At the last show the Prescott steam car was almost unknown to the general public. To-day its reputation as a time tried, thoroughly reliable and dependable medium price car is firmly established. Consequently the task before Frank F. Weston last week was a much easier one. From his vantage point in the restaurant he worthily upheld the cause of steam, and found many to listen to him.

"We did business both with agents and with individuals," said F. F. Weston. "In the latter case the sales were made on behalf of the agents, of course, in one case four sales being booked for the account of one agent. You may say that we are very well pleased with the show, and since it have closed some deals that were pending when the show closed."

One of the few departures from the standard types of gasolene engines was found at the stand of the Shelby Motor Car Co., and as a consequence it attracted much attention. The greatly increased power claimed for the engine, which has two opposing pistons in a single cylinder, makes a good "talking point," and the substantial appearance of the car caused it to make a favorable impression. President Beardsley of the company was much pleased with the reception met with.

With two such drawing cards as the Diamond single tube and detachable tires, and a real novelty in the shape of a non-blooming inner tube, the Diamond Tire Co. did not lack for business. A census of the tires made by the Diamond Co. showed that 41 per cent. of the cars exhibited were fitted with their tires. Consequently they are in high feather, and point to this remarkable showing as proof of their claims of superiority. Among the officials and others in attendance were Messrs. W. B. Miller, O. S. Tweedy, Sam. Randolph and O. J. Woodward.

During the show last week an impromptu testing ground was made of the little hill over the New York Central Railroad at Forty-eighth street. The grade is only fairly steep, ranging from 22 to 26 per cent, but the car must approach it slowly and under a disadvantage. Among the few cars to surmount it was a Kensington, fitted with a Kelecom motor. To demonstrate its capacity it was driven up the hill, first frontward and then backward, a feat that resulted in a sale on the spot.

All the tire companies were well represented, the show being made a meeting place for sales managers and salesmen from all over the country. The Hartford Rubber Works Co.'s new metropolitan manager, Robert P. Parker, was there, as was the retiring manager, Brandt, and President L. D. Parker and Sales Manager Gilson. Hartford, Dunlop and Turner tires were all in demand, an extremely satisfactory business being done in them.

"Whitney standards" become better known each year, as well as better liked. An examination of the chains produced by the well known Hartford concern explain why this is the case. The excellence of the designing and the soundness of the workmanship insure the best results. Hence the Whitney order book is bulkier than it was before the show.

The Fisk Rubber Co. showed its detachable tire for the first time, and it scored an instant success. The method of attachment is novel, the tire being held in place on a flat rim by a clamping ring, making a secure fastening and insuring easy attachment and detachment. Messrs. Fisk and Dunn were in attendance, as was E. Broadwell of Detroit.

There was no lack of visitors or business at the stand of A. H. Funke. Kelecom motors, Autolyte lamps and Baldwin spark plugs were in demand throughout the week, and Mr. Funke was so pleased with the net results that he engaged space for the 1904 show.

"Our sales will not fall very far short of $100,000, including some deals that were practically made but have yet to be closed. That being so we cannot make any complaint, but on the contrary are very well pleased," was the way Manager Kimball of the Central Automobile Co. put it.

At the Goodrich booth Messrs. Howard E. Raymond, Otis E. Cook and Cy. Tullis took care of the trade visitors. The "original American Clincher" tire, as the Goodrich is termed, was pushed to the full limit, and a very satisfactory volume of business was transacted.

Messrs. Harry C. English and J. G. Zeigler, who looked after the interests of the Reading Automobile & Gear Co., reported that Wyoma motors and gears had met with an excellent reception.

"Business has been all that we could expect," was the summing up of Mr. Zeigler.

Although new to the trade and public, the "Bann-Auto" wheel made a favorable impression, its peculiar construction seeming to insure more than ordinary efficiency. Patentee and Owner Bannister has the greatest faith in the wheel, and considers that its reception at the show warrants it.

With two exhibits—one in the restaurant and the other on the main floor—to look after, the National Motor Vehicle Co. were kept busy. With eleven models of National electrics, many of them new, it was to be expected that good business would be done, and Sales Manager Hay stated that such expectations had been realized.

To get acquainted with the trade was the task of President Ray of the Ray Automatic Machine Co. set himself last week, and he succeeded admirably. The Ray hoods, fenders, mufflers, etc., are better known as a result, and that great desideratum, orders, followed quite naturally.

"Sperry batteries will be ready for delivery in March," such was the cry of General Manager Devine of the National Battery Co., and the interest with which the announcement was received augurs well for the sales of this well known storage battery.

The Hoffman gasolene car is something of an eye opener, price considered, and President L. E. Hoffman, as positive as ever, was present to make plain that there was something besides price to recommend it. He succeeded to his entire satisfaction.

Diamond chains were found on many cars at the show last week, and as a result of the vigorous campaign conducted by President Garford, Sales Manager Colt and Advertising Manager Wardrop, all of whom were present, an increase in the number is likely to take place.

"Yes, we have done a fine business, ten times as much, in fact, as at the last show." Such was the emphatic assertion made by Charles E. Miller to the Motor World man. "The sales have been on all lines of goods. No, we have no 'kick' coming."

Both from its size and its striking Colonial decorations, the Mobile stand was an attention-compelling one. The many new patterns of steam cars shown added to its attraction and drew crowds of interested users to that vicinity throughout teh week.

Digitized by Google

"We did business," said General Manager Gallaher of the Mobile Co., "and it was about equally divided between the trade and the individual users."

In spite of its large factory capacity, the Cadillac Automobile Co. is sold out. By the middle of show week the order went forth to decline further orders, and thereafter applicants were "turned down" ruthlessly. Sales Manager Mitzger was naturally elated at the success attending a venture launched within a year, and, like so many other sales managers, will henceforth turn his attention to getting out the goods. He was ably assisted at the show by F. C. Riggs, a recent addition to the Cadillac selling forces.

As purveyors of such fittings as wood and wire wheels, front and rear axles, steel rims, etc., the Weston-Mott Co. always merit and receive respectful attention. The show under notice was no exception. Under the capable direction of Fred. G. Mott, jr., buyers were taken good care of, and the result was reflected in the sales.

The two big motors shown by the Buffalo Gasolene Motor Co. were about as good arguments in favor of the company's product as could have been found. They looked extremely business like, and in no small measure accounted for the very considerable number of sales made.

With customers passing over the cash for Herz spark plugs in plain sight, it did not require the assertion of E. J. Willis to make it plain that he was doing business last week.

In addition to the old reliable corrugated tread tire that has entered into wide use, the G. & J. Tire Co. showed for the first time one with a smooth tread, which is likely to have a considerable sale during the coming season.

One of the earliest dealers, representing one of the oldest makes of cars, Kenneth A. Skinner, and his De Dions, were very much in evidence. A good showing was made of both complete cars and motors, and Skinner expressed himself as being very well pleased with the business done.

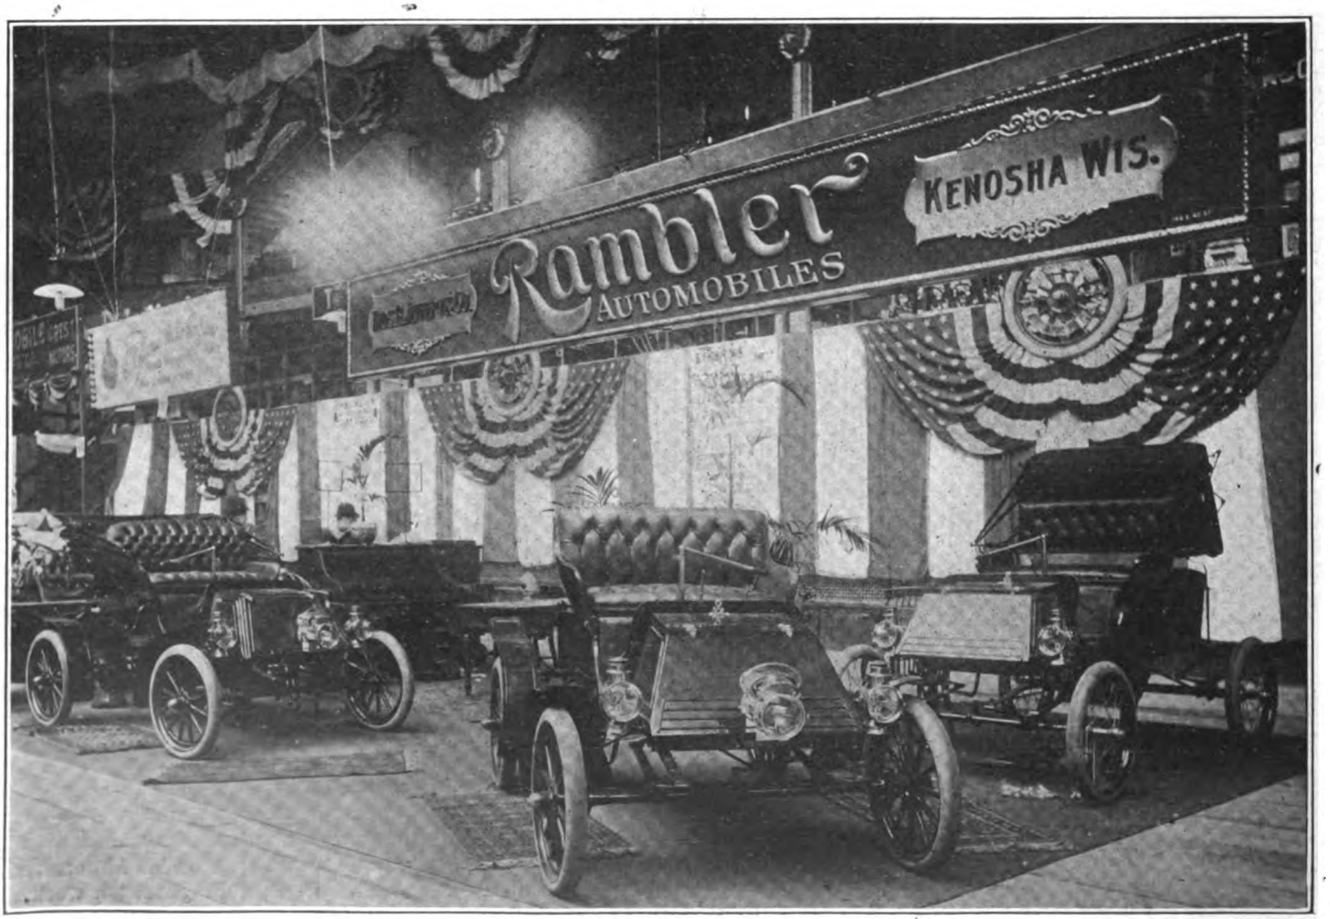
Greatly changed and improved, the new Crestmobiles are still marked by simplicity and low price. This accounts in great part for their continued popularity, which was demonstrated anew last week. President Davis and Manager Adams expressed their satisfaction with the result.

President F. C. Philips, smiling and debonair, talked Elwell-Parker electric motors, and was remarkably successful in convincing his listeners of their superiority. Result, a nice sheaf of orders.

"Yes, we did business, and lots of it," was the reply of "Governor" Castle of the Twentieth Century Mfg. Co., and his tone and manner showed that he meant what he said, and that Twentieth Century lamps were going well.

Although the Automotor Co. are not seeking large orders, the Messrs. Smith, who looked after the company's interests at the show, were well pleased with the reception accorded to the new Automotor, and the orders that followed in its train.

Shows without the Kelley generator and burner, and the ubiquitous C. E. Weaver to dwell upon their good points, would lose much of their naturalness. The one of last week possessed all three, however, and all around satisfaction prevailed.



Manager Folger of the American Coil Co. was another member of the vast army of pleased exhibitors. The concern's spark coils, plugs, etc., had a great run, and there was satisfaction felt as a result.

F. C. Billings and Wallace Post, of the Billings & Spencer Co., were both in attendance and wore satisfied smiles at the end of the week.

"We are here mainly to educate people to the advantages of electrically welded tubing and rims," was the way W. H. Pirrong, of the Standard Welding Co., expressed it, "and are content with what we have done."

With the ballbearing idea firmly rooted in the public mind, it is not strange that the American Ball Bearing Co. were able to hold their heads high.

Barry & Hayes had in the Georges-Richard car an attraction that kept their stand well filled.

WINTON AND FOURNIER SIGN

Series of Three Races Finally Arranged—First One for Set July 25th.

On Wednesday night Alex. Winton concluded to accept Fournier's terms for a race, or rather the compromise of his terms suggested by Winton on January 17. In fact, Mr. Winton declared that he would race Fournier under any conditions, and that he was willing to post $5,000 to bind the match at once. Accordingly it was arranged by the promoters of the races that there should be first one meeting at the Empire track, at Yonkers, N. Y., and then one on the Glenville track, at Cleveland. Should each win a race it was arranged that the third meeting should be on the track which had showed the faster time.

On Saturday night the representatives of the challengers and those promoting the contest got together at the show and the following articles of agreement were signed:

We hereby agree to compete in two automobile races, and, if a tie results, to have a deciding contest—the first race to be at the Empire City track, Yonkers, N. Y., and the second at the Cleveland Driving Park, Glenville, Ohio.

Saturday, July 25, 1903, shall be the date of the first race, with July 27 or the next available date in case of postponement. The distance of this event shall be twenty-five miles, standing start, contestants to start on opposide sides of the track, one at the wire and one at the half-mile posts, positions to be decided by toss of the coin; the winner to be that operator who completes the distance in the fastest time.

Should there be an accident to either machine in the first mile the race shall be stopped and restarted.

A date between August 1 and 12, to be decided by March 1, shall be the date of the second race, with the next available date in case of postponement. The distance of this event shall be twenty-five miles, standing start, machines to start on opposite sides of the track, one at wire and one at the half-mile post, positions to be decided by toss of coin; the winner to be that operator who completes the distance in the fastest time.

Should there be any accident to either machine in the first mile the race shall be stopped and restarted.

The winner of two races of the series shall receive a $1,000 cup, same to be supplied by the Empire City Trotting Club and the Cleveland Driving Park Association.

Should a third race be necessary the track shall be selected on which the fastest time is made in the two previous races. It is understood that Fournier and Winton shall not meet in a match or open automobile racing in the United States previous to this series.

Sanction and rules of the Automobile Association shall govern these races.

On either of the tracks named the race will be a terrible test of skill and nerve. The tracks will not hold the machines at their utmost speed, and it will be a question of which man can drive faster and make the corners safely. It will be a great race, with a severe temptation to the men to risk life and all in crowding the limit of safety.

Will Veto Marks Sprinkling Law.

Just at the time of going to press it is learned that Mayor Low, of New York City, after a hearing, has decided to veto the Marks' street sprinkling ordinance, passed by the Board of Aldermen on January 20. Tihs is the ordinance against which The Motor World has fought. It would preserve the present system of sprinkling, instead of having the work turned over to the Department of Street Cleaning, as was urged by the automobilists, horsemen and wheelmen. The ordinance was opposed before the Mayor by Counsel W. W. Niles, for the A. C. A. and N. A. A. M.; by the League of American Wheelmen, the Associated Cycling Clubs, Merchants' Association, West End Association and the City Improvement Society. Mayor Low said the sprinkling as done has been very bad, and that he though it never would be properly done until placed in charge of the Street Cleaning Department. He found several defects in the Marks ordinance and volunteered the statement that he would return it without his approval. A shipment of soap seems to be due now.

Parker Succeeds Brandt.

It became known during the last days of the show that E. H. Brandt, the manager of the two New York City branches of the Hartford Rubber Works Co., was soon to retire from all connection with the rubber company after a service of nearly a dozen years with it. Mr. Brandt resigned, and on Tuesday last he left the Hartford company and stepped into the position of manager of the United States Fastener Co., which by purchase and consolidation now practically controls all patents on the various styles of clasp fasteners for gloves, pocketbooks, shoes, etc. In his new capacity Mr. Brandt will have his headquarters in Broome street, New York. He is succeeded in the rubber company by Robert B. Parker, who comes from the Hartford factory equipped with a thorough familiarity of the product of the concern and a business ability and disposition calculated to retain old friends and win new ones.

New Maker in Terre Haute, Ind.

A new comer in the manufacturing field is announced from Terre Haute, Ind. It is the Standard Wheel Co., which has begun to turn out machines for which the bodies are built by the Terre Haute Carriage Co. The first machine turned out is built on the general lines of French cars, and weighs 1,200 pounds. It is expected that the factory will be running in full swing by the middle of February and have a capacity of three cars a week.

Making Automobile Bodies.

The Springfield Metal Body Co., Springfield, Mass., has absorbed the business of the Springfield Cornice Works, of the same place. The concern is prepared to quote prices on all styles of automobile bodies on receipt of specifications.

BAITING EDISON'S BATTERY

A Pastime of Show Week—When it is now due to Appear—Delay "Explained."

The men in charge of the Edison exhibit at the show had a week of much-mixed pleasure. While the name Edison caught the crowd, the tradespeople, remembering keenly how the newspaper exploitation of the unripe battery had filled the public mind with false ideas to the great detriment of the business, fairly baited and bombarded the Edison representatives almost from the beginning until the close of the show. They were called on to answer many direct and embarrassing questions by men whom they did not know but who did know whereof they asked.

When a Motor World man took his turn at the quizzing operation, the Edison attendant, a most gentlemanly and agreeable chap, soon grew red in the face. After the latter had spoken his little piece narrating how the Edison battery had been used on a Baker runabout and accomplished 80-odd miles without recharging, the reporter inquired:

"Have the Baker people themselves ever used the battery?"

"No."

"Has any one else ever used it?"

"No, I can't say that they have."

"Then you yourselves are the only ones that have had it in operation?"

"Yes. You see, we have to do the testing."

"When will it be on the market?"

"The first set will be delivered and applied within two weeks to a delivery wagon of B. Altman & Co., the New York dry goods merchants."

"What has been the cause of the delay in marketing the battery?"

"It takes a long time to make dies and tools, you know."

"But it is now more than a year since the battery was first shown to the public. Surely it does not take that long to make the necessary tools, does it?"

"It takes a long time."

"But I have known whole factories to be built and equipped and producing goods requiring dies and tools in less than a year," ventured the reporter.

"That may be. But it takes a long time, as I have told you."

Nothing more could be drawn out of the young man, whose face by this time was of a lobster hue, and whose discomfiture and desire to escape were only too apparent.

From another source the Motor World learns that there has long been a "kink" of some kind, and that recently one of the highest priced electrical experts in the country had been engaged to, among other things, discover and, if possible, remove the kink from the battery, which exteriorally looks not unlike a gallon can of gasolene.

EAMES ON MOTOR WAGONS

Delivers an Instructive Lecture, but deals only with Electrics—Fair and Fallacious Tests.

A comparatively small audience was on hand in the parlor of the Automobile Club of America, in New York, last Tuesday night, to listen to Hayden Eames of the Westinghouse Electric and Mfg. Co., of Pittsburg, Pa., speak to the text, "Comment on the Progression of the Commercial Automobile." It was noticeable, though, that the attendance comprised the more practical element of the club, rather than the sport following and social elements. President A. R. Shattuck was absent, and Winthrop E. Scarritt presided. Mr. Eames spoke, without notes, in a conversational style that was interesting in itself.

The thing most emphasized by the lecturer, who reverted to it again and again, was that the electrical and mechanical difficulties of the storage battery for motor vehicle use have been overcome, and that the greatest obstacle which now exists to the general adoption of the electric delivery wagon and truck is the ignorance concerning the practicable stage which they have reached, and a timidity about innovation which leads possible purchasers into asking unreasonable tests to be made. The talk of Mr. Eames was confined to the electric delivery wagon and largely to the experiments of a certain express company in Pittsburg. In substance he said:

"This company, when about to organize, was earnestly advised by a storage battery concern that storage batteries would not do the act. The express company went ahead and built delivery wagons with iron tired wheels. I have here the statement of the foreman of the stables of that company, showing the actual cost for one year of three wagons and four horses and the yearly cost of one electric delivery wagon which does the same amount of work. In this statement the hire of drivers, deterioration of stock, interest on money invested and everything is figured in.

"The cost of the horses and wagons for the year was $3,460.40, and that of the electric wagon $1,998.50—a saving of $1,461.90 made by using the motor wagon. Now, in that calculation I found that the things charged to the electric wagon included a full cycle of repairs, so that the batteries had been completely replenished. No horses were reckoned upon as dying, which they would do in other years and so add to cost of the horse drawn wagons, while the batteries would be as good as new every year, so that this cost for the electric wagon would be the same every year.

"In this relation I want to call your attention to one respect in which we have advanced greatly in the understanding of storage batteries and how to use them. They used to make us believe, four or five years ago, that when the positive plates of a battery were worn out it was time to throw the battery away. Now we know that we can renew all the plates and have a battery as good as new, that the battery will last indefinitely, and that the cost of running is the cost of renewing the plates.

"A case in which I know the figures to be facts is that of an Adams Express wagon, which cost in one year $200 to opereate, and that includes renewals and charging. Of course, every wagon cannot be operated so economically, but this shows what actually has been done.

"The technical and mechanical problems of the storage battery have been so overcome that it is wholly practicable; the difficulty now in the way of their introduction is the misapprehension of those who should be purchasers. All that any truckman or expressman has to do is to substitute a motor wagon for a horse drawn wagon for a while and note the work done and the expense, and that will settle it. Most curious objections are made to the use of the wagons. I am reminded of an army report made upon the use of a new magazine rifle. The new firearm was received and a battle won against a superior force, and the victory was admittedly due to the use of the new repeating rifle. In making his report to Washington the general wrote that the new arm was in every way superior to the old one, that the battle had been won because of its rapid firing possibility, that it did not choke up or exhaust the ammunition as was feared, but that in spite of all this he regretted that he could not recommend the adoption of the gun, because it was impossible to 'support arms' with it. That report actually exists and I have seen it, but it is no more amusing than the reason the manager of the trucks at a department store gave for refusing to recommend the adoption of a motor wagon. He had tried one and admitted that it did the work of more than two horse wagons, and cost less to maintain, but, he said, it had to be charged at noon, and that interfered with his routine.

"Another case of absurd testing is that in which a certain department store indulged. It took a wagon and sent it fifteen miles with one package. The wagon went and returned all right, and the firm next day gave an order for $8,000 worth of such wagons, which it now wants to get rid of. That was an insufficient test. Another, just as wrong in the other direction, was made by a man in Rochester. He ordered a wagon for trial. He did not ask what was its radius of use, but made up his mind that if it would not go fifty miles straightaway he did not want it. He sent the trial wagon out to go fifty miles. It would not do it, and he sent it back. That man's trucks and wagons, it was positively learned, never were sent more than twelve miles on one trip.

"Another illustration of the mental confusion and unfairness that exist with regard to the motor wagon happened in Pittsburg, where one of the iron tired delivery wagons was pitted against the horse drawn wagons. It was three or four weeks before Christmas, when the streets became covered with ice. Now, the iron tires will take hold on wet asphalt when rubber tires will slip; they will take hold through soft snow, but on hard, smooth ice they will slip when the rubber tire would not. The company had a set of iron tires made that were sharp shod. It took three-quarters of an hour to have the sharp shod tires shrunk on, and every one derided the poor motor wagon that required so much trouble. Next door to the wheelwright shop where the sharp shod tire was put on was a farrier's, and there every day during the icy weather there was a string of horses in that shop from 8 o'clock in the morning until midnight. They were being sharp shod, and every day three-quarters of the horses there were animals that had been there two days before. A team would wait for several hours before being attended to, but that was all right. That was something to which every one was accustomed. It had been done for years. It cost more and took more time than the change of tires on the electric wagon, but that was nothing. Meanwhile the motor wagon went on without being tinkered any more, and did the work of three or four of the wagons drawn by sharp shod horses. This illustrates the queer mental attitude of many which is yet to be overcome."

A number of questions were put to Mr. Eames after the talk, one of them being with regard to his opinion of the Edison battery. Mr. Eames said that the merit of the battery was something of which no one could speak properly except those on the inside.. "Now that we have storage batteries with which the only question is of a renewal of the plates," he added, "the Edison battery, or any other, to be desirable must be almost as cheap as first cost, and must give more per pound of its weight. The Edison battery in its present form costs a great deal more than others, and even if it is better—which I very seriously doubt—there is nothing revolutionary about it."

Motor Trucks in Railroad Service.

The Long Island Railroad is said to be having several automobile trucks made to be used in the express service. At present the wagons from downtown New York cross to Long Island City on the James Slip ferry. It is figured that automobile trucks could run uptown on the New York side to the Thirty-fourth street ferry and pick up considerable business on the way.

Haynes-Apperson in Chicago.

An office has been opened at 381-385 Wabash avenue, Chicago, by the Haynes-Apperson Company, with L. W. Smelser in charge. This will be occupied until May 1, when it is expected that a new building at 1,420 Michigan avenue, which is being erected especially for them, will be ready.

Fischer Incorporates With $2,000,000.

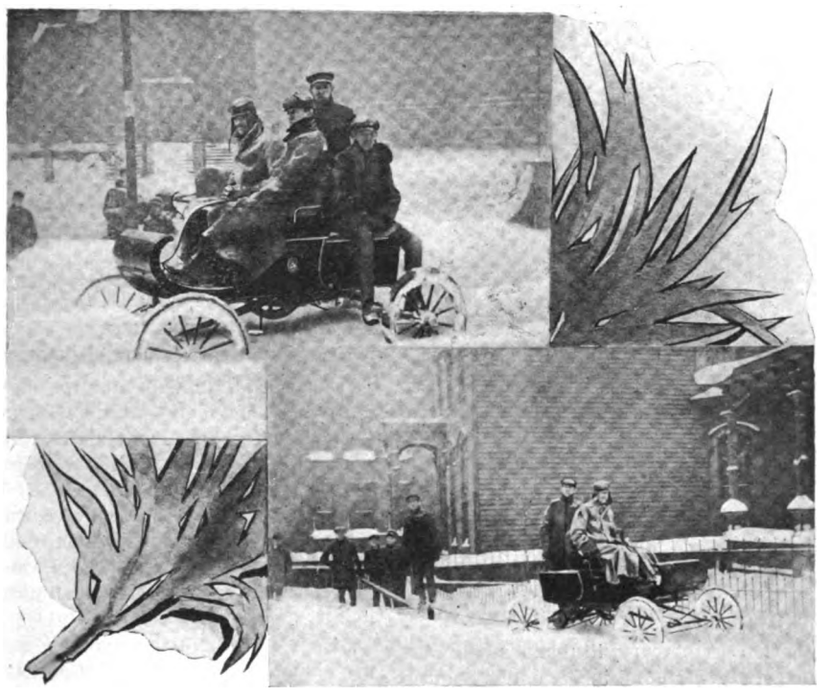
Jersey City, N. J.—Fischer Motor Vehicle Co., with $2,000,000 capital. Corporators—William H. Burnett, Charles H. Stewart and William H. Crolius.

Digitized by Google

AGAINST CANTOR-ENO LAW

Aldermanic Law Committee Understood to Favor the Original Ordinance with 15 miles Clause.

It has been reported on excellent authority that the law committee of the Board of Aldermen in New York will report favorably upon the original traffic ordinance introduced by Alderman Oatman, with the amendment with regard to speed that was agreed upon as a compromise by the Automobile Club and the Committee of Fifty. This is the amendment fixing a limit of eight miles an hour in the busy parts of the city, with a limit of fifteen miles in the outlying districts.



This action by the law committee will render of no avail the "snap" hearing called by Borough President Cantor a week ago last Monday, which was "loaded" with persons who had not been to any former hearings on the subject, but were on hand to favor Mr. Cantor by advocating the ordinance drawn by William P. Eno. The only quibble in relation to the traffic ordinance has been with regard to speed. The Committee of Fifty and the West End Association had a frightful lot of spasms because it was originally proposed to fix the speed limit at ten miles an hour for all parts of the city. The compromise mentioned was effected after several weary hearings, and then along came Mr. Eno, with his bill proposing a uniform limit of ten miles an hour. The dear gentlemen of the Committee of Fifty and the West End Association were not there to again tell in tearful tones how the women and children of the city would be slaughtered if such an ordinance were passed, but there were present several matronly women, some of them gray haired, who calmly approved of the Eno ordinance with the terrible speed of ten miles an hour and all.

The amended section, which will be reported favorably and probably become a law, shows just what the rules will be for all. It is as follows:

Article II, Section 1. Speed of vehicles—The following rates of speed through the streets of the city shall not be exceeded—that is, eight miles an hour by bicycles, tricycles, velocipedes, motor vehicles and streetcars, however propelled, or by passenger and other vehicles drawn by horses or other animals, except that in the Borough of Manhattan, in Broadway north of 181st street, on the Boulevard Lafayette and on Washington avenue, and in the boroughs of Brooklyn, Queens, The Bronx and Richmond, upon streets where the buildings are at least 100 feet apart, a speed of fifteen miles an hour may be maintained.

Article II, Sec. 2. No person riding, driving or in charge of any vehicle on any street, avenue parkway or driveway in the city shall drive the same at a speed greater than reasonable and proper, having regard to the traffic and use of the highway, or so as to endanger the life or limb of any person.

Article II, Sec. 3. Exceptions—Nothing in this article shall apply to the apparatus and wagons of the Fire and Police departments, the fire patrol, ambulances, emergency repair wagons or street railroads and vehicles carrying the United States mail.

THE OLDSMOBILE AS A WINTER VEHICLE.

REMODELED RACING RULES

To be Completely Overhauled, says Stewart—Revisions Drafted but Still Carefully Guarded.

After many half hearted attempts to revise them, the so-called racing rules of the American Automobile Association are to be thrown overboard and a new set compiled. The rules were a legacy from the Automobile Club of America, having been drafted by a committee of the club when automobiling was a young thing that was not supposed to know much. Consequently the rules of the French Jockey Club were used almost bodily, and much trouble has resulted at race meetings since by reason of their shortcomings and inconsistencies.

To a Motor World representative last week Chairman W. J. Stewart of the race committee of the A. A. A. stated that a new set of rules was being prepared.

"The old rules were handed down to us by the A. C. A., you know," he said, "and while we have made several efforts to change them and bring them up to date our efforts have not been successful.

"Now, we have asked the clubs and individual automobilists interested in racing to offer amendments to the rules. Thirty days are given for this purpose, and meanwhile we are at work on a complete new set. We expect to have everything in hand and put in shape before the opening of the racing season."

It is proposed to make the rules concise, clean cut and explicit. There will be a racing vocabulary and a glossary of many terms added.

One proposition is to have a triple classification of cars. The first class will be without limit, and include any four wheel machine that runs on a track by a motor. The second class will be confined to standard stock machines, practicable for any day use. The third will be known as the manufacturers' class, and is intended to encourage makers to prove their transmission and bearings.

The cylinder area, piston stroke, gearing and weight are the factors now being calculated by a scientific student as the basis of a fixed handicap figured down to feet and inches.

Knox's Expansion.

A fivefold increase of factory space was made last week, when the Knox Automobile Co., Springfield, Mass., purchased the Schastey plant in that city. It immediately adjoins their present factory, and the two will be operated in conjunction. The Schastey factory is a two storied brick building 300 by 130 feet, and is completely stocked with wood working machinery. Most of this will be sold, and will be replaced as soon as orders can be filled with more available machinery. Six weeks will probably be needed for restocking the building.

Digitized by Google

Calculation of Horsepower.

To calculate the horsepower of a gasolene engine on the basis of its stroke, bore and revolutions per minute, the mean effective pressure during the working stroke, which is exerted on the piston by the explosion of the compressed gases, may be assumed as about 75 pounds per square inch.

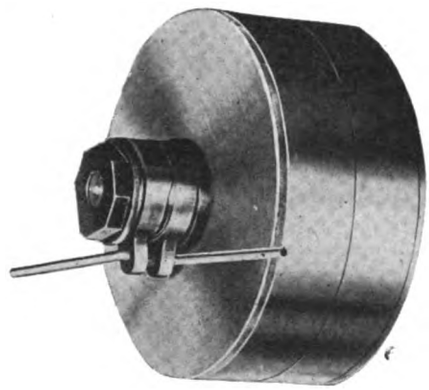
The horsepower is, then, the product of this mean pressure by the length of the stroke in feet, by the area of the piston in square inches, and by the number of working strokes or explosions per minute, the resulting product of these being then divided by the number 33,000. The area of the piston is obtained by squaring or multiplying the diameter by itself, and the product thus obtained by .7854.

For a single cylinder engine the working stroke is one out of every four strokes, i. e., one out of every two revolutions of the crank shaft. For a double cylinder engine there is a working stroke every revolution, and for a four cylinder engine two working strokes per revolution.

To Prevent Skidding.

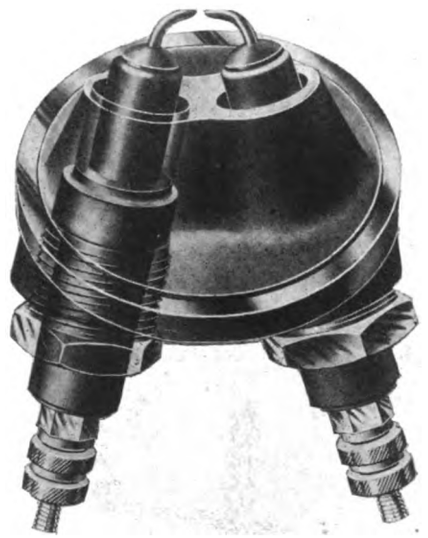
British autoists are interested in a device to prevent side slip. It consists of two flexible wire hoops, one on each side of the wheel and of slightly larger diameter than the rim. The hoops are connected by steel chains passing diagonally from one hoop to the other round the tire. The hoop, or ring, on the inside of the wheel is endless, but the outer hoop is supplied with a right and left hand screw coupling, which affords a ready means for adjusting the non-skidder to the tire. The diameter of the hoops is such that they cannot pass over the periphery of the tire, and it is claimed they cannot come off even when it is deflated.

The non-skidder is not fitted tightly enough to impress the tire visibly, and in running "creeps" slightly, so that the chains never bear on the same point of the cover at any two consecutive revolutions.



The Subject of Governors.

To the non-mechanical governors are a sealed book until they give the matter a little thought and investigation, and then they are, or at least the principle is, as plain as the proverbial pikestaff. The familiar ball governor found on all steam engines, or even on the top of many elevators, once seen illuminates the subject. An upright shaft, to which the arms containing these balls are hinged, revolves, and the centrifugal force causes the balls to rise and actuate a valve, thus regulating the supply of steam or explosive mixture. As the speed diminishes the governor balls fall, of course, and the valve is opened again. The construction of these governors varies widely, but in principle they are identical.



The Banker Bros. Co. have arranged to handle the new Century gasolene car attheir establishments in Pittsburg, Philadelphia and this city.

Some Cadillac Characters.

Brimful of good, clever features the Cadillac is, as its wonderful sales fully attest. In constructing it the Cadillac company have

not asked how cheaply a part can be constructed, but how good. That they have succeeded in keeping quality to the fore a close

examination of the car will demonstrate. An instance of this is found in the extensive use of steel drop forgings, many parts usually

made of castings being in the Cadillac forged and then machined.

As showing the care given to details, the Cadillac spark plug can be adduced. This is furnished either in the double form, an illustrated, or with the regulation single plug. It is held that by making a special spark plug, and careful wiring, the usual sources of trouble are practically eliminated. The amount of insulating material is double that generally used. The inner ends of the insulated sparking points are in close proximity to the inlet valve, so that the incoming charge of cold air keeps them free from any deposit of soot, a very frequent source of trouble.

The compactness of the transmission gears, which are of the well known sun and planet type, giving two speeds forward and a reverse, will be seen by a glance at the illustration.

The accessibility of the shaft bearings and the ease with which they can be removed if necessary is another noteworthy feature. The illustration shows the bearing, with cap, removed and the lower part of the bearing lining partly out. The removal of the cap permits this lower half to rotate in the frame, and as a half revolution brings it on top of the shaft it then may be lifted out, and by a converse operation a new one easily put in its place, restoring the original perfect alignment and proper fit of the shaft bearings in a few minutes, no matter how long the old ones have been used. This is accomplished without disturbing in any way any other part of the motor.

De Dion's Ignition Discovery.

It is a well known fact in physics that gases are heated by compression, but it has been left for the De Dion-Bouton Co. to make use of this natural law in connection with internal combustion engines. The company has invented a method of ignition based on the law in question, which, if all that is claimed for it is fact, will go a long way to overcome one of the autoist's most serious troubles.

Briefly, an auxiliary cylinder and piston are supplied with a charge of gas which they compress to flame heat, when it communicates by means of a tube with the combustion chamber of the main cylinder.

Assuming the possibility of heating to the flame point by the compressive power of an ordinary motor, it is evident that the motor must first be started, and the temporary use of electric ignition would therefore appear to be necessary. But the chief difficulty would probably be in so regulating the firing charge as to insure that it should flame at the right moment.

Packard's School of Employes.

Some little time ago the Packard Motor Car Co. began to give a series of lectures to such of their employes as were interested in the principles of construction and operation of the parts which go to make up a complete automobile. The experiment has been attended with unexpected success. An average of sixty pupils attends the lectures, and the classes display great interest.

LATE COMERS AT THE SHOW

Tardy Exhibits that Contained Much that was Novel and Interesting.

Among the usual late comers at the show were several notable exhibits, descriptions of which were necessarily omitted in last week's review. Among these were the Wick, an unexpected addition to the number of high priced gasolene cars of American manufacture, and the Clement and Darracq chassis. These, and particularly the former, are magnificent specimens of the most approved French constructional methods, and were examined with keen interest and pronounced to be the finest exhibits of the kind ever shown here.

These and a few other unnoticed exhibits are reviewed below:

The A. Clement Co., Paris, France, having a branch factory at Hartford, Conn., showed one light tonneau car and a complete chassis. The motor of the tonneau is of the two cylinder vertical style, developing 10 horsepower. Both valves are mechanically operated. The ignition is by magneto, and the transmission is of sliding gear type, direct drive on top speed, the clutch having expanding segments. The drive has a longitudinal shaft, having only one universal joint. The frame is of wood, having steel flitch plates. The water cooling is done by a centrifugal pump working direct through the engine circulating the water through a tubular radiator. The motor of the chassis is of a four cylinder type, developing 14 horsepower, the general details of construction being the same as on the finished car exhibit. The water cooling is done through a centrifugal pump circulating the water through a beehive radiator of small square section and a rotary fan, which is actuated by a belt with a grooved pulley on the end of a secondary shaft, which operates mechanically also the induction and exhaust valves.

The Union Motor Truck Co., of Philadelphia, Pa., exhibited a motor express wagon which has a body like the regulation horse drawn express wagon. With the exception of the batteries, which are carried under the seat, the body is entirely free, so that its carrying capacity is as large as any ordinary wagon. Heavy wooden wheels with solid tires are used. The front and rear axles are connected by a framework of 5-inch channel iron rivetted with steel castings, those of the rear axle taking the form of bearings in which the axle revolves. The front casting is dropped to accommodate the height of the front axle, by which it is pivoted by a steel bolt; an auxiliary thrust brace is also used. The three steel castings are provided with the usual block plates to carry the wooden springs and clips. The motor and all the machinery is carried on this framework. The motor is what is known as a two cylinder Otto cycle, having copper water jackets. The stroke is eight inches and the piston five and one-half inches in diameter. An electric ignition of break spark is used. The valves are of the poppet type, and are vertical, and in starting the exhaust valves are held open during part of the compression stroke. No gears, belts or chains are used in transmitting the power, but instead a "silent reversible roller ratchet" is used on the rear axle, and a variable throw crankpin in the flywheel of the engine. A hydraulic pump is used for forcing oil into the piston, driven by a side shaft of the engine on a 3-inch bronze gear, which engages in the 8-inch gear on the friction clutch. The wagon is operated as follows: The engine is instantly started by a hand ratchet on crank shaft. The engine being under way, the silent, reversible roller ratchet being in its normal go ahead position, the operator desires to stop his wagon, possibly heavily loaded. Having hold of the hand lever, he pushes it forward a few inches, when the friction clutch starts the pump, and, like a hydraulic jack, the crankpin begins to move off of centre. As there is no lost motion in the roller ratchet, the vehicle begins to move instantly, although the pin may be only one-quarter of an inch off of centre. In this position the leverage is greatly in favor of the engine, and its stupendous starting torque is developed at the rear driven axle. For each second of time the pump acts the pin advances approximately one-quarter of an inch, and the wagon rapidly accelerates until the desired speed is obtained, all of which may occupy from two to ten seconds, according to the speed desired. Having attained the desired speed, the lever is brought back to normal position, the pump disengages and ceases work and, the crankpin being oil locked, the wagon maintains a constant speed until the driver desires to slow down or increase it further. To back the wagon the reversing lever is thrown over, which causes the cage to recede and the rolls engage on the opposite incline.

Upton Machine Co., Beverley, Mass., who are the makers of the familiar and popular Upton transmission gear, showed for the first time a complete tonneau touring car, having an aluminum body with a channel frame. The motor is of the four cylinder vertical type, of great simplicity, developing 16 horsepower. On the car shown the motor has automatic inlet valves, but on a larger size that they make the mechanically operated valve is used. All of the motor connections are of heavy brass tubing fastened by couplings which are readily disconnected. The exhaust pipes are of very large capacity, connected to a large tube, which is supplementary to the regular muffler, making a very quiet exhaust. The radiating coil is of copper, with copper corrugated web fins; the water is forced through it by a pump actuated by a sprocket and a chain from the main shaft. The oiling is by a positive plunger pump, having a glass cylinder so that the quantity of oil can be seen. The ignition is by jump spark and vibrating coil. Of course, the Upton transmission gear is used, of the 1903 model, which gives a much faster low speed, and having a ratio of two and one-half to one. In this gear the controlling gears are now done away with, the drive being by plain spur gears in the slow speed. The driving is by a bevel shaft to a countershaft on the Panhard style, driving on the rear wheels by two chains. The throttle control is from a small side lever inside of the seat on the left hand side. On the steering pillar are arranged two small hand levers and rods, one to arrange the proper mixture of gas, the other to advance or retard the spark. The two main operating clucch levers are on the left hand side of the car. If the car is under full speed a foot pedal can be thrown on, which operates the brake for disconnecting the clutch through the side lever, back into its normal position and stopping the car. Another foot pedal is for reversing, and a third one is for the slow speed. The slow speed pedal can also be used as an auxiliary brake if desired. The car weighs 2,500 pounds and costs $3,000. The trimmings on the car are all of brass, and are beautifully finished.

H. B. Wick & Co., Youngstown, Ohio, exhibited a big tonneau touring car. This car has an aluminum body, with a frame of I beam steel construction. Half elliptic springs with body irons are used. Both axles are cranked, or dropped between the spring clips so as to lower the frame and produce a low centre of gravity. The motor is of the four cylinder upright type of 28 horsepower, having a 4¼-inch bore by 6-inch stroke. Both valves are mechanically operated by a single cam shaft working on the main shaft with a rocker lever to the supply valves. This rocker arm is held down by a spring. The exhaust valves have a very powerful coil spring, and the inlet has a very light spring, so that when the lower end of the rocker arm drops into the lower part of the cam a supplementary spring pushes up the other one. Artillery wooden wheels with 34x4½ inch detachable tires are used, the axle bearings being full Collinge type. Every bearing on the transmission gear and the transmission and the cross shaft is of an open ring oil pattern, the same as is used on high speed dynamos. The electric ignition is controlled by a small notched circle and toothed wheel on top of the steering wheel. The throttle for the vaporizer is also controlled on the steering pillar by a notched segment. The water cooling is done by a pump operated by a sprocket and chain on the main shaft, which forces the water through a set of radiating coils in front of the chassis, immediately behind and above it, being a brass tank with 105 half-inch square holes, giving 1,500 square inches of radiating surface. A McCanna hydraulic oil pump is used to oil all the bearings and the cylinders. Ignition is by regular make

Digitized by Google

and break spark, storage battery being used for starting and a magneto afterward. The transmission is of the slide gear type, three speeds forward and a reverse, all operated from one lever having a safety touch device, so that they cannot be thrown in unless a foot pedal is used, which releases the conical friction clutch on the flywheel. An emergency brake with an inside expanding ring is used on each rear wheel. A double chain drive with a bevel drive shaft is used for the rear wheel traction. The price of the car is $8,000.

American Darracq Automobile Co., who are the United States agents for the D. Darracq & Cie., France, exhibited two tonneau cars, one being a 12 horsepower; price, $3,250; the other, with a limousine top, of 20 horsepoweh; price, $7,500. A superb chassis was also shown, which has already been noticed. On the Darracq cars of 12 horsepower and over some new features are shown. The motor, as is well known, is the Mercedes type, with twin cylinders cast in one piece, having valve motion mechanically operated on both the inlet and exhaust valves, and which are operated by gears from the main shaft. A honeycomb style of radiator and water tank is used, with an exhaust fan to induce an extra draught of air. The oiling system is automatic, the oil being kept warm so as to feed readily in cold weather. The regular brake consists of two friction shoes operating on a drum of the driving shaft, the emergency brake being operated by a hand lever working on the rear hubs. The setting of either brake throws the clutch out. A vibrator is used with batteries. The bodies of these cars are very much larger this year, having tonneaus capable of taking six passengers without crowding. The upholstering is luxurious, and the finish is beautiful to an extreme degree. An entirely new governor, so arranged that it is under perfect control at all times, is used, together with a contact breaker entirely protected from mud and wet.

The Backus Water Motor Co., Newark, N. J., exhibited a new, medium weight touring car, Stanhope body, for two passengers, using semi-elliptical springs with long body irons to carry the body, with a horizontal single cylinder motor located under the seat of 5½-inch bore, 8-inch stroke, developing 12 horsepower. The motor is air cooled by fifteen copper rings one and one-half inchs wide shrunk on the cylinder and eighteen copper bevelled vanes projecting. It is claimed for the use of these copper rings that copper possesses 2.4 times the heat absorbing capacity of iron. The motor is further cooled by a powerful forge blower, which is operated by a flat rubber belt from the flywheel. Another peculiarity of this cooling arrangement is that the motor and the cooling rings are inclosed, and the air is forced through by the flanged blower from the front to the back of the car. The motor is started from the seat by a ratchet, and has mechanically operated valves, operated by cams on a secondary shaft which is part of the transmission. The transmission is of the back spur gear type, such as is used on a lathe, with bevel gears introduced into the pinions for the reverse. The clutches are of the disk style, eight inches in diameter with fibre washers one-eighth inch thick between the surfaces. The frame is a plain rectangular one of machine steel. Price, $1,100.

The First Steam Coupe.

One of the steam carriages that attracted an unusual amount of attention at the show was the new Mobile coupe. It was pronounced by carriage makers who visited the Garden to be the finest coach job there.

The vehicle is substantially built, handsome in appearance and luxurious in appointment. It is designed to carry from six to nine passengers, weighs 3,000 pounds and costs $3,000. It is equipped with a simple two cylinder engine, developing 10 horsepower and having 3⅛x4 inch cylinder dimensions and mounted on an angle iron frame. The boiler measures 17½x14¾ inches, and has a capacity of nine and one-half gallons. The new Mobile burner of the Bunson type, with special steel tip, is used, and gasolene is employed as the fuel.

The wheel base is 7 feet, and 30-inch wheels, either wood or wire, with International tires are fitted. Lever steering and chain drive are employed, and two double acting band brakes. The tanks have capacities of seventy-two and sixteen gallons of gasolene and water, respectively. A water regulator, low water alarm and fuel regulator are supplied.

Outwhizarding Edison.

To invent and construct a rotary steam engine for which $1,000,000 has been offered, and a gasolene engine that can be reversed—this is the work done by a Netherwood (N. J.) man, J. W. Taggert by name.

Particulars are wanting, the imaginative reporter of the local journal omitting these, but asserting that Taggert has outwizarded the Wizard of Menlo Park in producing revolutionizing automobile inventions.

"By a simple though ingenious method the inventor reverses all the general laws governing the building of gas engines, and has cast aside all precedent and has simply reversed the engine and makes the cylinder work the same as the piston usually does," the description says. "In other words, he takes the piston and makes it stationary and works the cylinder back and forth over the piston. Reinforced by an ingenious method of controlling the gas, compression, explosion and exhaust, he secures power at every revolution of the machine."

The steam engine, which can be made of a size to "propel a baby carriage or a steamship," is a "rotary engine that will develop power at only five pounds of steam pressure to the square inch, and at twenty-five pounds of pressure a speed of 7,000 revolutions per minute can be attained and 30 horsepower secured. What is more, the entire machine when running can be rested on a man's shoulder with the greatest ease, and even when running at that great speed will not suffer the least jolting."

The secret of the machine is jealously guarded by the inventor. The fundamental principle is the revolving cylinders and the absence of any sliding pistons or eccentrics. It is worked on the general plan of the turbine, excepting that this engine, when running at a speed of 7,000 revolutions a minute, can instantly be reversed without a single jolt or jar.

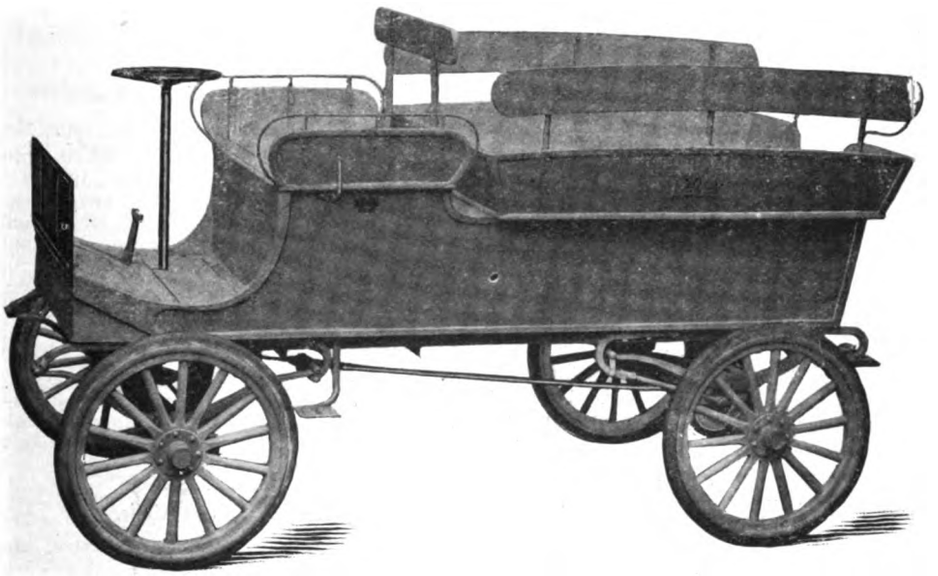
Extent of France's Trade.

Some interesting figures regarding the French automobile trade were given by Baron Rothschild at a dinner given in his honor at the Automobile Club of Great Britain. After pointing out that the imports have never yet reached more than $100,000, he showed the exports to be as follows:

1900.....	7,259,000 francs =	$1,450,000
1901.....	13,414,000 " =	$2,682,800
1902.....	26,551,000 " =	$5,310,200

In giving these figures the Baron pointed out that the sums quoted did not nearly represent the gross amounts received by the French trade, for the reason that the imports and exports are valued by weight by that department of the French Government which does the appraising on these goods. The vehicles, parts, etc., are appraised in bulk at 10 francs, or $2, per kilogramme, the kilogramme being 2.2046 pounds. Thus cars weighing 500 kilogrammes are set down at the value of 5,000 francs ($1,000), 750 kilogrammes at 7,500 francs ($1,500), and so on, which, from the point of view of the actual selling price, is absurd. Cars weighing 1,000 kilogrammes, and racing cars of crack manufacture, have been frequently sold on a basis of $3 a kilogramme.,



The Baron then went on to state that the total number of firms engaged in the construction of automobiles in France was seventy, having turned out 12,000 cars, and employing no less than 45,000 hands. Taking into account the number of men employed in accessories and the tire trades, the total overtopped 180,000, earning an average wage of $360 per annum. In 1902 tires to the value of $3,000,000 and $600,000 had been sold in France by the Michelin and the Continental firms, respectively.

By the above showing he thought he might claim that in France the construction of automobiles and their appurtenances had in the last few years developed into a national industry. The great strides in perfecting the vehicles were due to the encouragement of racing; for in order to shine in speed competitions the builders had made efforts to improve their vehicles which most assuredly they never would have made for private individuals.

Making Stage Building Easy.

Appreciating the steadily increasing demand for automobile stages, the Brecht Automobile Co., St. Louis, Mo., recently designed and brought out the one shown herewith. It has given great satisfaction to its purchaser, and it will hereafter be carried as a regular stock vehicle.

The stage is made to carry eight or ten passengers, one in front with the operator and the others sitting facing each other. It is shown in the white, ready to be equipped with either steam or gasolene power. The frame is of angle iron, and a positive wheel steering device is fastened in front, with Brecht's patented radius rods on each side of the running gear, which keeps the chain in proper tension at all times. Double acting brake bands, with foot lever attachment and a canopy top, is also furnished, if desired. The vehicle has artillery wood wheels with full metal hubs, and 2½x32 inch solid rubber tire, 1½-inch front roller bearing axle, 1¾-inch rear axle revolving in roller bearings under springs.

Schooling their Agents.

So many dealers and their employes have visited the factory of the National Motor Vehicle Co., Indianapolis, Ind., of late that a miniature school may almost be said to be established there. At one time a week or two ago there were between twenty and twenty-five men familiarizing themselves with National construction.

Willis Gets a Good Man.

F. E. Moskovics has been added to the staff of E. J. Willis, the well known New York jobber. Mr. Moskovics has been captain of the New York Motor Cycle Club and is well versed not only in motorcycles but in all that pertains to automobiles.

Increase of Electrics in England.

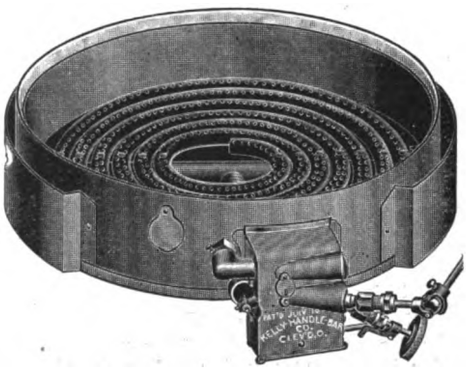
That the electric vehicle has not stood still in the years since it was introduced is well known. Some figures prepared by an English investigator bring the matter out in a particularly clear light. In 1896 the weight of a battery to give 2 brake horsepower for six consecutive hours was twenty-one hundredweight; it is now only seven hundredweight, the efficiency, too, having increased from 70 to 90 per cent, he says. Motors have been reduced in weight, as has also the total weight of the vehicle, while the annual cost of maintenance and the charges for current have been materially reduced.

The Catalog of the Packard.

"With the same care and attention the Packard motor car will give better results than any other automobile made," is the opening statement of the new Packard catalogue, and it is put right up in front where the reader cannot miss it.

The publication is striking looking in its red and gold cover, and is well printed, in colors, in bold, handsome type on heavy calendared paper, with illustrations of complete cars, chassis, etc., and factory scenes. Altogether it is one of the handsomest publications of the year.

Test of Tire Detachability.



To show the rapidity with which a detachable tire can be taken off and replaced, a test was recently held at Paris, a Continental tire 100 mm. by 125 mm. being used. M. Tampier, official timekeeper to the A. C. of France, held the watch, and M. Albert Sougelin proved the winner. He completely removed the tire from one wheel and replaced and inflated it to a pressure of four atmospheres in the short space of 5 minutes 53 2-5 seconds.

Exides in Rochester.

A new Exide battery depot has been opened at Rochester, N. Y., by the Electric Storage Battery Co., Philadelphia. It is located at the establishment of J. J. Mandery, at No. 158 South avenue. Owners of electric vehicles equipped with Exide batteries in this district can now use this depot for any matters requiring information or attention.

How the Kelly has been Bettered.

Never content to let well enough alone, the Kelly Handle Bar Company, of Cleveland, Ohio, with their usual alertness to take advantage of every possible chance to improve the already satisfactory Kelly burner, have got out a new one piece steel tubular burner, with an entirely new casing. This casing is constructed with no gauze or holes in the bottom, the air being drawn in from the ends. This, it has been found, prevents all

underlapping of the fire—a much to be desired improvement.

The burner, too, being constructed without air tubes, through the continuous stop tube, makes it utterly impossible for the burner to back fire, even if it were to become red hot. The advantages in this respect are obvious. This form of construction has been thoroughly tested, having been in use on a number of cars the past year, and in no case have they ever given the slightest difficulty or other than entire satisfaction. Users of steam cars will find the latest Kelly Handle Bar Company's effort a most welcome aid, increasing the efficiency of steam vehicles.

One of Dixon's Toots.

To the task of reducing friction to a minimum the Joseph Dixon company address themselves, and how they succeed, as far as automobiles are concerned, is fully set forth in "A Toot for Dixon's Graphite," a little booklet just issued by the well known Jersey City concern. The "tooting" is supposed to be done through an automobile horn shown on the front cover. The virtues and uses of Dixon's graphite are set forth attractively and convincingly.

Deals with the General.

General runabouts, in their two passenger and detachable tonneau bodied form, are described in detail in the catalogue just issued by the General Automobile & Mfg. Co., Cleveland, Ohio. These cars, which were formerly termed the Cleveland, are good specimens of the type of medium powered, medium weight, gasolene vehicles at a popular price that are attracting so much attention just now. The catalogue is well printed and contains marginal illustrations of typical road scenes.

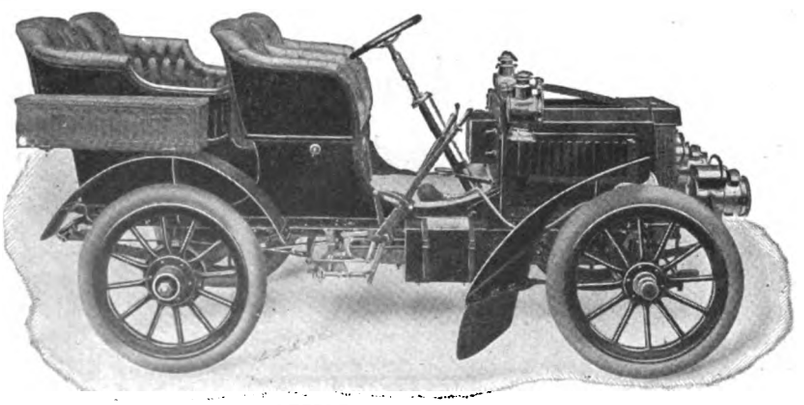
Repair of a Leaky Pipe.

A good temporary repair for leaking water pipes or radiators is effected by covering the pipe around the fracture or joint with white lead and binding with tape. The tape should be well smeared with the lead as it is wound around the pipe, the edges of the bandage being well leaded. When dry this makes quite a good repair, and one which has been known to last for a considerable time.

Halsey on Vandeventer Avenue.

The Halsey Automobile Co., St. Louis, Mo., is erecting a $20,000 garage on Olive street near Vandeventer avenue. The building is to be 50 by 120 feet in area, two stories high, of brick and terra cotta, with stone trimmings. It will have a large office and spacious salesroom.

Cadillac will Carry Nationals.



Arrangements have been made whereby the National Motor Vehicle Co.'s goods will be handled in Chicago by the Cadillac Automobile Co. of Illinois, at the latter's new establishment, 1312 Michigan Boulevard, which is nearing completion.

Williams's Spark Coils.

Spark coils in a number of styles, and especially adapted for gasolene car work, are described and illustrated in a catalogue issued by E. Q. Williams, No. 535 South Clinton street, Syracuse, N. Y.

The Week's Exports.

TIMKEN ROLLER BEARINGS

Easiest Steering **Easiest Running**
Lightest Weight **Greatest Strength**

TIMKEN ARTILLERY HUBS

are made entirely of steel, except dust caps, which are brass, making the LIGHTEST and at the same time the STRONGEST artillery hub on the market.

All sizes from 1 in. to 2 in., either in finished steering knuckles or complete front axles, either solid or tubular.

TIMKEN BEARINGS for all kinds and sizes of rear axles; also all kinds and sizes of complete rear axles.

TIMKEN BEARINGS are WARRANTED FOR TWO YEARS, and the only roller bearings in which ALL WEAR CAN BE TAKEN UP. Dissatisfied users of other style bearings should consult us.

Many of the leading automobiles at the New York and Chicago shows will be equipped with TIMKEN ROLER BEARINGS. See our full line exhibit at both shows.

TIMKEN ROLLER BEARING AXLE CO., CANTON, OHIO.

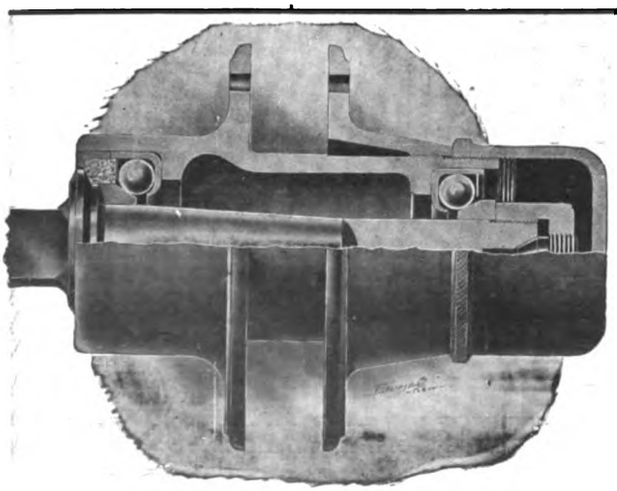
NATIONAL BATTERY COMPANY, - BUFFALO, N. Y.

WYOMA Automobile Gasolene Motors.

French Type. Water Cooled.
8 H. P., Single Cylinder.
15 H. P., Double Cylinder.
Equal in workmanship, finish and service to the best foreign makes.

WYOMA Transmission Gear.

3 speeds forward, one reverse.
New system; no bevel gears.
Gears always in mesh.
Ball thrust at each end of shaft.
Enclosed in aluminum case.
Will transmit up to 20 H. P.



WYOMA Differential Spur Gear.

Manganese bronze bevel gear.
Fitted for either 1¼, 1⅜ or 1½ inch axles 8 pitch.
60 teeth.
For direct drive.
Rod transmission.

We are also manufacturers of Tubular Running Gears, Radiating Coils, Aluminum and Brass Hoods, Wood and Wire Wheels, Auto Mufflers and Carburettors.

READING AUTOMOBILE & GEAR COMPANY, Tenth and Exeter Streets, READING PA.

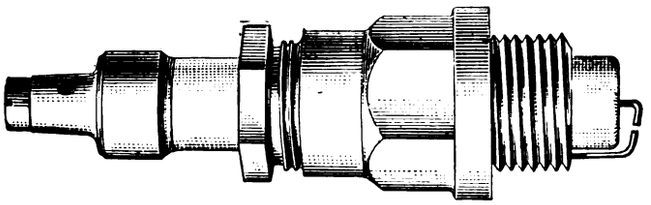
Artillery Wheels.

We are now prepared to furnish these Hubs, Ball-Bearing and Key-Seated, for Automobiles weighing from 500 to 4,000 pounds.

Front Hubs are Ball-Bearing and are assembled on our well-known Steering Axles.

Rear Hubs furnished with Ball-Bearings or Key-Seated.

ALL RACES ARE GROUND IN POSITION IN HUBS. CONES AND CONE SEATS ON SPINDLES ARE GROUND TO GAUGE.



Hubs and Spindles are machined Right and Left.

The Oldsmobile

THE CAR WITH A RECORD.

To see one is to admire its appearance; to own one is to thoroughly appreciate its splendid perfection.

Made in the largest and best equipped automobile factory in the world. Each detail of its strong and simple construction is the result of 23 years' experience in gasolene motor building. Each working part is made from the best Drop Forgings, with the result that the OLDSMOBILE is "The best thing on wheels."

PRICE, $650.00.

Every part of this mechanical marvel is made or finished in our own factory by the most skilled automobile specialists. Built on unique lines under patents covering all the essential parts, its sterling merit cannot be copied by imitators There is nothing problematical in the OLDSMOBILE—it "goes"—it gives absolute satisfaction and is still the cheapest reliable automobile in the world.

Our statements are proven by the evidence of the OLDSMOBILE'S 7000 drivers. Practical every-day service means more than all the theoretical argument and experimental efforts of the "paper manufacturers."

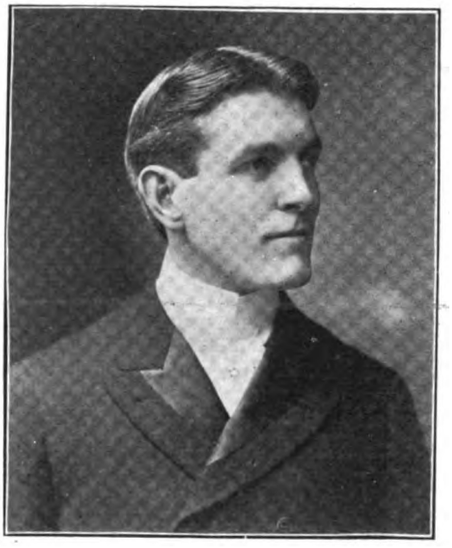
BUDLONG MADE PRESIDENT

Prearranged Slate Goes Through at N. A. A. M. Election—Explusion and Censure Dealt With.

Milton J. Budlong, vice-president and treasurer of the Electric Vehicle Co. of Hartford, is the new president of the National Association of Automobile Manufacturers. Mr. Budlong headed a "slate" that was slipped through at the well oiled meeting of the Executive Committee on Wednesday. The full ticket of officers elected is as follows:

M. J. Budlong, Hartford, president; H. Ward Leonard, New York, first vice-president; Windsor T. White, Cleveland, second vice-president; Charles Clifton, Buffalo, third vice president; Percy Owen, New York, treasurer. The appointment of Harry Unwin as secretary, made on January 7 by the old executive committee, was ratified.

Of the fifteen members of the executive committee fourteen were either personally present or represented by proxy. R. E. Olds was the only absentee. Those present were:



Lucius T. Gibbs, Vehicle Equipment Co.; Windsor T. White, White Sewing Machine Co.; C. E. Duryea, Duryea Power Co.; John Brisben Walker, Mobile Co. of America; I. H. Page, J. Stevens Arms and Tool Co.; M. J. Budlong, Electric Vehicle Co.; Frederic M. Lande, U. S. Long Distance Co.; Charles Clifton, George N. Pierce Co.; J. P. Taylor, proxy for F. S. Fish, Studebaker Bros. Mfg. Co.; J. Wesley Allison, Woods Motor Vehicle Co.; H. Ward Leonard, Ward Leonard Electric Co.; S. T. Davis, Jr., Locomobile Co. of America; Percy Owen, proxy for Alex. Winton, Winton Motor Carriage Co.; George B. Adams, proxy for J. W. Packard, Packard Motor Car Co.

S. T. Davis, Jr., presided, and when the time came for the election of officers he suggested pleasantly that it was customery to appoint a nominating committee, and thereupon appointed H. Ward Leonard, Percy Owen and J. Wesley Allison as a nominating body. After retiring for a very brief interval they returned with the ticket prepared.

"The committee appears to have taken good care of itself on the ticket," smilingly remarked the presiding officer.

Then a motion was quickly made that the secretary cast one ballot for the ticket, and this was done. Gentlemen present who during the show had led Windsor T. White to allow his name to be used as a candidate concealed whatever embarrassment they felt and quietly acquiesced in the simple little programme.

Concerning the location of the officers, that matter was left to the discretion of the president and secretary. After the meeting it was officially stated by the secretary that the offices would remain where they now

M. J. Budlong, President, N. A. A. M.

are, at 7 East Forty-second street, New York.

The question was brought up concerning the expulsion of Automobile Topics for having attacked Mr. Shattuck and others and also for having, during the New York show, declared Automobile Topics Daily to be the official organ of the N. A. A. M. The matter was referred to a committee. The manager of the Chicago show was also censured for making that publication his official organ. No one laughed except the secretary.

It was decided to have the Association incorporated, and a special meeting was called for March 18 in New York, to revise the constitution and bylaws.

The recommendation from the main body that a contest should be held over the Fort George Hill was approved and referred to the Technical Committee for the arrangement of details.

SPAULDING WILL QUIT

Action Begun to Dissolve Buffalo Concern—Protection of Creditors Given as the Cause.

Proceedings were begun in the Special Term of the Supreme Court at Buffalo on Thursday last asking for a voluntary dissolution of the business of the Spaulding Automobile & Motor Co., of that city. On the application of a majority of the stockholders Justice Childs appointed Nelson P. Baker temporary receiver, fixing his bond at $12,000.

Mr. Baker is the secretary of the company.

The action will excite surprise chiefly because of its suddenness. It was known by concerns having dealings with the Spaulding company that there was something wrong. Payments were belated, and very little satisfaction was forthcoming to those desiring settlements.

The Spalding company was of comparatively recent formation, and did not cut much figure in the trade. It made a car of the gasolene runabout type.

According to Mr. Spaulding himself the proceedings were instituted as a matter of protection for the general creditors, all of whose claims, he stated, will be eventually settled in full.

It is understood that the liabilities of the concern are more than $20,000 and the assets less than $5,000.

Joyce Retires.

James J. Joyce, jr., general manager of the International A. & V. Tire Co., Milltown, N. J., has presented his resignation, to take effect on March 1. Mr. Joyce has been connected with the company for a number of years. He has several propositions under consideration, but will not decide upon his future connection for some weeks.

At the expiration of the lease of the present quarters on Forty-second street, this city, the general offices of the Locomobile Co. of America will be removed to the factory in Bridgeport. President Davis made the announcement during the N. A. A. M. meeting yesterday.

STARTS ON SUNDAY

And Why That Day was Chosen for Paris-Madrid Race—Cup Race in Belgium?—Paris's Newest and Most Remarkable Road.

French Bureau Motor World.
2 Rue d'Abbeville.

Paris, Jan. 21.—The start of the Paris-Madrid motor car race has been definitely fixed for Sunday, May 24. Two principal considerations have weighed with the committee of the A. C. F. in fixing the start on a Sunday. In the first place there will be much less traffic on the roads and hardly any farmers' carts, and as the route from Paris to Bordeaux, which will form the first day's run, lies over the most populated portion of the whole distance, it is most important to have the roads as free as possible both on account of the danger and also to allow the obtaining of the highest speeds. In the second place the public take a very great interest in road racing and it is the desire of the A. C. F. to make this sport as popular as possible and Sunday is the only day on which the working population will be able to turn out and witness the great international events.

The entries for the race opened on January 15, and all entries received between that date and February 15, will have their position at the start of the race decided by ballot. Entries received after February 15 will be set down to start in the order in which they are sent in. There will be four classes, namely: motor cycles (up to 50 kilos) entrance fee 50 francs; voiturettes (250 to 400 kilos), entrance fee 200 francs; light cars (400 to 650 kilos), entrance fee 300 francs, and heavy cars (650 to 1,000 kilos), entrance fee 400 francs. After April 16 the entrance fees will be doubled and the lists will be irrevocably closed on the evening of May 15 at 6 o'clock.

In addition to the four classifications specified about there will be a competition in each class for regularity. Each manufacturer will have the right to name a set of four of his cars in each or any class, which he desires for the regularity trial, but he must name the four not later than the evening of May 20 at six o'clock and after that date no change whatever can be made in the set he has named. The set of cars in each class which does the best average time will be the winner of the regularity trial of its class.

The Paris municipal council has decided to build what will be most important and certainly the most unique road in the world. It will start from the Arc de Triomphe and forming a straight line with the Champs Elysees, run right into the middle of the ancient forest of St. Germain to the Croix de Noailles, a total distance of a little more than eleven miles. The road which will be about forty yards wide, will contain twenty footpaths for pedestrians, two paths for cycles, a road for horse-drawn vehicles, a road for automobiles and an electric railway in the middle. The cost of the construction of the road will be upward of 1,160,000 francs, and as it will be seen by the above description, each form of modern transport will be able to circulate on it quite independent of the other and no doubt at a speed suitable to its capabilities.

Among the latest victims to the French police and with three days prison hanging over his head, is the Baron Henri de Rothschild, and strangely enough while he was being condemned by the magistrates in Paris, he was lecturing to the members of the English Automobile Club on the prudence with which they should temper their speed. It seems, however, that the Baron committed the terrible crime of refusing to show his papers to the police when called on to do so and although he is appealing against the judgment it will hardly be possible for him to escape from the clutches of the law in this case.

The statistics of the City of Paris, for the first three months in 1902, has just been published and in the chapter entitled accidents, there appears the following interesting figures:

Accidents caused by horse-drawn vehicles, 597; deaths, 23.

Accidents caused by falls from a height, 30; deaths, 18.

Accidents on the river, 50; deaths, 9.

Accidents caused by bicycles, 30; deaths, 0.

Accidents caused by automobiles, 92; deaths, 1.

Divers accidents, 369; deaths, 40.

By these figures it is clearly shown that next to bicycles automobiles have the least percentage of fatal accidents, namely, 1.08 per cent, while horse-drawn vehicles are more than three times more dangerous for their percentage of fatalities is 3.8, and notwithstanding these telling figures, the self-propelled traffic is the subject of constant and vexatious prosecution and persecution by the police and autoists are obliged to carry a distinguishing number, while the horse-drawn traffic, consecrated by custom, is allowed to run its own free will without interference.

The choice of a route for the Gordon Bennet Cup is occupying the attention of at least three European clubs. The A. C. F., of course, wants the race to be run in France and in connection with the great race of the year from Paris to Madrid, and in favor of this plan there is much to be said, for the roads in France and especially the Paris-Bordeaux road is perhaps the most suitable in the world for high speeds. It is wide, well laid and has few sharp bends, and in addition to this there are comparatively few large towns on the route, and consequently few neutralizations. The cars which are being prepared for this international struggle, will certainly be faster cars than anything that has ever yet been on the roads, so that a good course is more than ever necessary. On the other hand the English Club would prefer to meet its French competitors on neutral grounds, if it is found impossible to have the race run on British soil. In view of this the Belgium Automobile Club has already several times hinted that it would be very glad to make arrangements for the race to be held in Belgium, which country has not challenged the cup this year, and is not therefore a competitor. The English club has now made a formal request to the Belgium club to organize the cup race over the Circuit des Ardemes, which is a route particularly suitable to the struggle, though it is not at all certain yet if the French club will consent to this arrangement.

Six-Hundred Cars at London Show.

Although opened without the slightest eclat, with society conspicuous by its absence, and with the spectacular accompaniments that marked the Paris show entirely lacking, the British automobile exhibition, which began at the Crystal Palace, London, on Friday last, is a distinct success. Except that of the Paris function referred to, no equal showing of cars has ever been made. There are more than 200 exhibitors, showing more than 600 complete cars. Outside the Palace were 120 more cars, used for demonstrating purposes. Business, with a big B, is the keynote of the show, as while the adjuncts of fashionable functions may be there later, they were not in evidence at the opening.

No startling novelties, no radical departures, were to be seen. The growth of the four-cylinder car, and the parallel popularity of the small, medium priced cars, were the most noticeable features.

American makers are pretty well represented. The White, the Baker, the Winton, the Locomobile and the Duryea all had a good showing, and their light weight and moderate prices attracted much attention. The Baker "Torpedo" was also on exhibition.

French cars were also a noticeable feature, most of the leading makers being represented.

The show was opened by Sir Albert K. Rollit, M. P., who reiterated the complaints against the British backwardness compared with American enterprise in the use of labor saving machinery.

Referring to the show in Madison Square Garden, New York, he said he hoped the British manufacturers did not intend to retire from such international contests. Sir Albert expressed the opinion that they should be strongly represented at the St. Louis Exposition and that the British Parliament should assist them in so doing, as the German Reichstag did in the case of German manufacturers. The speaker also said he thought that Parliamentary interference was largely responsible for Great Britain's backwardness in automobilism.

TWO SHOWS IN BOSTON

Blackballing Starts a Lively Row and a Rival Organization With Pretentious Plans.

Boston autoists are at loggerheads, and no Capulet and Montagu feud was more bitter than this one promises to be. The tradesmen are in one camp, the clubmen in another. Two associations are now in existence, two shows seem to be assured. Each faction ignores the other, and says it will go its own way regardless of its rival.

The trouble all arose, it is said, over the blackballing of two prominent members of the Dealers' Association who had applied for admission to the Massachusetts Automobile Club. Instantly there were threats of retaliation, and the two organizations forthwith swung far apart and have since been moving along parallel lines.

The clubmen have formed the New England Automobile Association, which "will have for its purpose the furtherance of matters pertaining to the automobile." Although having no official connection with the Massachusetts Automobile Club, many of the promoters are members of it. The gentlemen whose names are most closely identified with the new association are Colonel James T. Soutter, E. C. Lee, F. H. Tudor, Jr., Newton Crane, F. L. D. Rust and E. H. Clements. The association proposes to hold an automobile show in Mechanics' building the week commencing February 24, and will establish a circuit of race meets, with races in the leading cities of New England.

In the matter of legislative work, the association proposes to be prominent. It will be represented at all the hearings at the State House in which automobile interests are concerned.

The Boston Automobile Dealers have already completed arrangements for their show at Symphony Hall, during the week of March 16. Speaking of the rival show, Chairman Eldredge of the show committee of the Dealers' Association is quoted as saying: "The formation of the New England Automobile Association and the announcement that it will hold a show in Mechanics' Hall during the month of February will not disturb the plans of the Boston Automobile Dealers' Association in the least. We shall continue our arrangements and will hold our show in Symphony Hall on the date scheduled, the week commencing March 16. Inasmuch as all the automobile dealers in this section have secured space for our show, I cannot see wherein the proposed opposition show will injure us in the least. Not only have they secured the space mentioned, but, in the majority of instances, have paid for the same, and there is really no reason why our show should not be the success we have anticipated since we first determined and announced our intention of holding it."

On the other hand, President Soutter of the Massachusetts Club presented the new organization's side in this wise:

"The show in Mechanics' Building is intended to educate Boston people to take livelier interest in the automobile. Space has already been engaged by certain exhibitors. Some club members will exhibit machines, and manufacturers will be invited to send exhibits. But there will be a programme of interesting events for show week, such as brake tests, obstacle races for autos, and automobile 'stunts,' to make the show something like the horse show in its interest for the public. We have no sanction from the National Association of Automobile Manufacturers, but none will be needed for this will be only an association affair. A considerable amount of money to carry out the plans has already been pledged in subscriptions."

Entries for Trial Cup Races Close.

The entries for the team were formally closed on Saturday with L. P. Mooers, H. S. Harkness, Percy Owen and C. W. Matheson the candidates for the two vacant places on the team.

With regard to a trial contest for the candidates there is no doubt but what a test will be held. There is reason to believe also that the character of it has been planned by the committee, although it steadfastly refuses to reveal what its plans are. Said one member of the committee:

"When those cars arrive here on April 11 they will be tested, and well tested. You may be sure of that, but because the committee doesn't choose to announce its plans it is no reason to infer that it has none and does not know just exactly what the test will be. O, no!"

Not Likely to Build Motor Cars.

There appears to be little truth in the widely published report last week that the General Electric Co. would enter the automobile field with a gasolene car that it has been experimenting with for some time. That the company did build one such car is a fact. It was seen in Boston last October during the reliability contest. It is also true that the General Electric Co. may make automobile parts. But as to complete vehicles, the Motor World representative was told by a gentleman having unusual means of ascertaining the facts that there was absolutely nothing in it.

To Sell Oldsmobiles in Detroit.

One more local Olds company has been formed, the Oldsmobile Co., of Detroit, with the well known W. C. Rands & Co. as managers. The Olds product will, of course, be handled. For the present the business will be conducted at No. 254 Woodward avenue, but it is proposed to erect on one of the principal business streets a commodious garage, where cars will be displayed, sold, stored, repaired, etc.

IN BELGIUM OR IRELAND

Course for Cup Race in one Country or Other but British Cable Adds to Doubt.

Latest indications point to a probability of the race for the international challenge cup being held on Irish soil, with the neutral grounds of the Ardennes Circuit, in Belgium, offered as an alternative, and the date some time early in July.

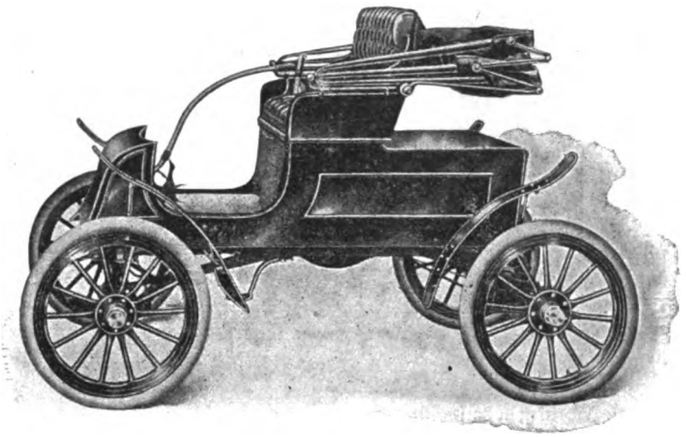
On Tuesday the Race Committee of the Automobile Club of America made it known that it was in receipt of a letter from the Automobile Club of Great Britain and Ireland, in which it was explained about the course that had been found in Ireland which, it is believed, complies with all the required conditions of the cup race rules.

According to the letter the proposed course has been somewhat changed from that first reported by the special committee sent to Ireland. As finally decided upon its circuit is 126 miles. The route embraces in order Naas, Kildare, Stradbally, Ballyroan, Athy, Kilcullen, Carlow, Athy, Kilcullen and Naas.

The letter from the British club to the A. C. A. was signed by David Solomons, chairman of the Committee on Foreign Relations, and it states that the Irish course as a whole has a finer roadbed than the course over which the race was run last year. Mr. Solomons writes that the A. C. G. B. I is naturally anxious to have the race run on British territory if possible, and that it hopes to obtain official permission to use the course selected. Failing in this it will have to choose between turning over the contest to the French club or to the Belgium club, which has written to the English organization offering it the use of the course over which the Ardennes Circuit was run last July. Mr. Solomons says that the French club would naturally make the cup race a part of the Paris-Madrid race on May 24, and that this date is deemed too early.

Replying to the letter the A. C. A. declared itself heartily in sympathy with the desire of the English club to have the race on the Irish course, and hoped that this could be done. It agreed with the sentiment that May 24 would be too early and that July would be a better time for the race.

After the exchange of these epistles and before the British organization had time to receive the reply of the A. C. A. there was received on Tuesday a cablegram from London asking:



"Is 9th July satisfactory, Gordon Bennett race?"

To this answer was sent saying "July 9 is satisfactory."

The inferences taken from this query were that either the English club has obtained permission to run the race or that it has been refused permission and is negotiating for the use of the Belgium course. Of the two inferences the former one was the more favored by the members of the A. C. A. Race Committee, which met specially on Tuesday to consider the communications mentioned.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, FEBRUARY 5, 1903.

"We congratulate you on your report of the New York show. Everything you claim for it is true."—F. G. Mott, Jr., Weston-Mott Co., Utica, N. Y.

Hands Off This Law!

Of all the laws affecting automobiles that are in existence there is not one so brief, so simple, so sane, so fair, so thoroughly understandable as that on the statute books of the State of Connecticut.

It is a model of clarity and comprehensiveness and of equal and exact justice that safeguards all interests and yet does not assume the automobilist to be more of a malefactor or criminal than the man who drives a horse.

To tamper with such a law would be little short of a crime; certainly, it would be profoundly deplorable. We sincerely hope that the efforts to that end will meet with the defeat that they deserve.

Of participation in the anti-automobile hue and cry that has been created throughout the country, Connecticut has been happily free, or almost free. It is the best evidence that the law as it exists is sufficient.

What it means and one of the most eloquent testimonials ever rendered to the State grew out of this same law. It was given by the Bridgeport doctor who, arrested in New York, where miserable class legislation aimed at automobilists is in force, exclaimed feelingly:

"Thank God, I live in Connecticut."

When a law can inspire such pride of citizenship, the legislator who would alter it merits being cast into the darkness of obscurity. As it stands it is a tribute to the progressive common sense and clearheadedness of the State. It would not be pleasant to be called on to revise such a high opinion.

The Sizes of Tires.

Tire sizes are yet very far from being standardized. Whatever change has been made for 1903 is undoubtedly in the direction of larger tires, but there are not wanting those who say that there is still plenty of room for improvement in this direction.

Primarily tire sizes and the weight they have to carry have a close and intimate relation. There are other considerations, of course—the weight and thickness of the enveloping walls, the weight and weave of the fabric, the shape of the tire and the rim, the character of the roads to be traversed. But they are of much less importance than the weight of the car to which the tires are to be be fitted.

For several years the belief has been growing that large tires were the only proper ones to use.

To-day the tire sizes range from 28 to 36 inches, with sectional dimensions of from 2½ to 4 inches, just as they did a year ago. But no makers have gone backward, i. e., reduced the dimensions, while many have increased them, sometimes the cross diameter and nearly always the sectional dimensions.

Both changes are, within reasonable limits, steps in the right direction. The belief, once entertained in some quarters, that pneumatic tires would give way to something less expensive has been shown to be a fallacy. Vibration intercepting devices of the kind are absolutely necessary, both for vehicle and passengers, and instead of decreasing the size of the air cushion it is likely to be increased.

For anything except the lightest runabouts tires smaller than 3 inches are unsuitable, failing to intercept the vibration to anything like the extent that is desirable. Cars of 1,500 pounds or more are better off with tires of more than 3-inch diameter, and for the heavy touring type 4 inches will be found to more than compensate for their cost by reason of the great luxuriousness that follows in their train.

The Course for the Cup Race.

With the coming of February, and the closing of the lists to aspirants for places on our team, the Bennett Cup race seems to be appreciably nearer. The cryptic cablegram from the British club, which seems to point to a July race in Ireland, also appears to add definiteness to the approaching struggle.

It should be borne in mind that the selection of the course lies entirely with the Automobile Club of Great Britain, as the holder of the trophy. Out of courtesy, the French and other clubs entering teams are asked to approve the course selected; but their approval is not necessary. Provided a "stretch" of "not less than 99¾ miles" is selected, it must be accepted, whether the other clubs like it or not. On the other hand, the British club can turn the race over to the French club, to be run in France, if it so desires or is unable to run it in Great Britain. To run it outside of Great Britain or France—in Belgium, for example—consent of the contesting clubs must be obtained.

It will be seen, therefore, that the British club is master of the situation up to a certain point. If it cannot find a course in its own country, or the Government will not accord permission, then it must go to the French club and negotiate further.

Under the rules, the race must be run between May 15 and August 15. The date may be named as early as February 1, and must be named thirty days in advance of the race. There is, therefore, still plenty of time for this.

The Bevel Gear Drive.

One of the most interesting developments of the day is the increasing popularity of the shaft and bevel gear drive to a live rear axle. This popularity is undeniable. No maker abandons the use of this method, while an increasing number adopt it every year, the number for 1903 being much larger than usual.

The movement is not confined to any type of car. The steam and the gasolene car both employ this method of transmitting the

Digitized by Google

power. At the recent show at Madison Square Garden its appearance on heavy gasolene cars was one of the notable features. The time honored individual chain drive to the rear wheels was overshadowed, the number of bevel gear driven cars even outnumbering it. Never before had they done more than make a respectable showing. Consequently their sudden leap into prominence was the more attention-compelling.

Opinions will, of course, differ as to the respective merits and demerits of the two systems. As a matter of fact, the long standing nature of the dispute indicates how impossible of settlement it is. Chain drives and bevel gear drives always have had and probably always will have their advocates as long as machinery that calls for one or the other is used.

The defects of the chain are mainly on the surface, and, therefore, notorious. It contains a multitude of parts, all subject to wear and consequent deterioration; it is almost necessarily dirty, owing to the difficulty of protecting it from the mud and dust; and it is particularly liable to breakages, sprocket jumping, etc. On the other hand, it is, when properly made and in good order, a remarkably efficient, reliable and accommodating power transmission medium.

The bevel gear, on the contrary, has "talking points" that make it a winner at first sight. It is clean, sightly, thoroughly mechanical. It is in keeping with the remainder of the transmission mechanism, which is largely made up of shafts and gears. But there is offered in objection to it the old theory of power lost in "turning a corner," of binding and breaking teeth, even of twisting shafts. In simple justice to it, it may be said that modern methods of construction, with their wonderful systems of gear cutting, fully meet these objections.

A year ago chains to the wheels were regarded as the only method of transmission to use with big gasolene cars. As in so many other things, French fashions were accepted without much demur, and the fact that nearly all the big French firms, together with many German and English ones, used chains was sufficient to cause them to be looked upon as the proper thing.

Now, however, a number of additions have been made to the ranks of foreign makers using bevel gear drives. No break has yet taken place among the oldest and most prominent concerns, but of the newer or more progressive ones, the bevel gear drive has undoubtedly gained ground.

The same tendency is noticed among our own makers. Coinciding, as it does, with the foreign movements, it shows that there is no indication of a desire to copy slavishly; instead, designers strike out on lines of their own and do their own investigating.

Economy of the Direct Drive.

One of the features of the show that attracted an immense amount of attention was the direct drive on the high speed. Cars or chassis with open gear boxes were fairly numerous, and crowds collected around them to examine this interesting variation of the regulation slide gear speed change method. The most popular type showed the drive direct through the main shaft, with its bevel gear pinion on the rear end. The forward gear wheel on this shaft was in mesh with one on the countershaft, but the power was not transferred to the latter, it merely running idle. Of course, when it becomes necessary to change to a lower speed the two gear wheels mentioned are thrown out of mesh and a main shaft gear slid along to engage the desired one on the countershaft, the power being, of course, transmitted to the main shaft again. The importance of using the high speed wherever possible, and consequently of having an excess of power in the engine, is readily apparent. The direct drive is wonderfully economical, just as the indirect one on the lower speeds is wasteful by comparison.

Officials who Offend.

That "the king can do no wrong" is a mooted point in these modern days, and constitutional kings are careful not to put the matter to a test too often.

What the autoist-persecuting English "Bobby" would do to his king if he caught the latter "scorching" at faster than twelve miles an hour is terrible to contemplate, so fierce would be the conflict 'twixt respect for his sovereign and disrespect for the latter's automobile. But the odds are that he would be looking the other way if he got a "tip" in time. It is not surprising, therefore, that King Edward should have covered eighteen miles in forty-five minutes the other day, and yet gone scot free.

Our Mayor Low, and yet more frequently Commissioner Greene, enjoy a similar immunity when they go automobiling. The latter can inspect widely separated station houses at the rate of a dozen or so an hour, and yet no alert officer hauls him in for exceeding the archaic eight miles an hour which is still the maximum speed in this city.

The trouble is more with the law than with such lawbreakers as those mentioned. It was General Grant who said that the way to do with a bad law was to enforce it, and if this were done with the antiquated traffic rules—horse drawn as well as mechanically propelled ones held strictly to them—it would not be long before the demand for a reform would be heeded.

The Bonus for the Chauffeur.

It is the Chinese, so the story runs, who pay their physicians only when they are well, holding that as it is their task to ward off illness they are derelict when it comes in spite of them. There are some owners of automobiles who think this plan, or some modification of it, would be a good one to try with their chauffeurs or mecaniciens. The latter don't seem to realize that they are successful only when they ward off the car's ailments. It is worse, of course, when their carelessness is to blame for mishaps or troubles than when some functional derangement of the car takes place. But the latter can frequently be guarded against and avoided if the caretaker puts his mind to it. Hence a system of rewards or bonuses when nothing goes wrong, and its cessation at other times, might be tried with some hope of bringing about an improvement. It could do no harm, at least.

Two more legislatures have turned their attention to automobiles—New Hampshire and Maine. The latter has had presented to it a very sensible measure. Such speeds as eight and twenty miles cannot reasonably be objected to, and the stated desire, i. e., to cover the subject by a State statute rather than by a multitude of local ordinances, with all the injustices and inequalities that mark the latter, is an excellent one. A little more legislation of this kind would be welcomed.

How terribly discouraging must have been the experience of that autoist who last week advertised that he would exchange his automobile—name not given—for a lot in Greenwood Cemetery! How many breakdowns, collisions, accidents and even runaways must the unfortunate man have encountered to cause him to prefer the grave to the exhilerating auto!

Commentary

Windsor White as president of the N. A. A. M.! That's something like it. And the association, if it honors White, will honor itself. If it comes about—please note the "if"—I wonder if that journalistic gentleman with the delightful Weberfieldian dialect whose specialty is wine buying will draw as many corks as usual. When during the show Mr. White was mentioned he was heard to exclaim:

"Vhite! Ah! de steam boom ees explosioned. He vill not do."

The salaried secretary of the association, too—the prospect must fill him with a conflict of emotions. Whoever he is and whatever else he does, the new president will do well to whisper a few words in Mr. Secretary's ear—if the present Mr. Secretary is retained. He's a very affable chap, but a man representing an organization of the sort can't afford to play favorites with New York newspaper men as he has done. He has one in particular who mentions him oftenest in print, and he truckles to him as he should not be permitted to truckle. He not only sends him advance copies of reports and runs to his office with "tips," but carries the thing to excess. I know positively that on one occasion a reporter called up Mr. Secretary and sought information, and no sooner was this telephonic conversation over than he hurriedly rung up his friend on the other paper to let him know that others were "wise" and had a certain story in prospect.

"Didn't I tell you not to give out that information to-night?" demanded the friend.

The secretary made some sort of explanation.

"Well, I don't care. I told you not to give it out. I don't want to work to-night."

Judge for yourself.

* * *

I am not going to criticise or praise the show, either in part or as a whole. It certainly was the biggest and the most profitable of any ever held in this country, and I am content to let it go at that, leaving my more competent brethren of the technical press to supply you with facts as to why all this was so. One thing I did notice, however, which I think is worthy of comment. There was very little attempt to make the affair a "social function" through the donning of evening dress by the employes of the exhibitors. Of course, there were a few misguided ones who thought that the wearing of a crush hat with a tailess silk-faced coat and a decollete waistcoat so disguised them as members of New-York's most aristocratic circles. Perhaps the editors of Flatbush and Hackensack society papers would never have known that the disguised ones were not the real thing had it not been for their being confined within the small railed in space wherein the exhibit of their employer was.

This question of costume had in most every instance, however, been wisely settled and well. Those whose duty it was to show and to explain the wares of their own or others' manufacture were dressed for the part they were to play, and they played it, too. The very first impression the visitor got when he sized up the human part of the exhibition was that it was for business, and with this plainly before them the visitors at once proceeded to talk business. The passing of the very foolish inclination to open the horse show and turn the automobile show into a cheap clothes and millinery exhibition speaks volumes for the ability of those who have already succeeded in making the manufacture and marketing of mechanical carriages a veritable miracle of rapid progress. That the public appreciated this was shown not only by the numbers who paid to see the show, and who, far in excess of any horse show, paid there and then to own samples of the vehicles they had come to see and study. Had the automobile show done nothing else but establish its drawing and its selling powers without any attempts at cheap costuming it deserved all the success it has achieved.

* * *

While all of the papers were filled with automobiles stories last week, it was but natural that some of those whose sole ambition in life it is to get themselves and their performances into print should have had their envy excited by the apparent ease with which the automobile rolled rapidly into the centre of the stage where the limelight of publicity was fiercest. Among others who were thus affected was a society fringeite whose name is a combination of that of a signer of the Declaration of Independence and the chilly requisite for sleigh riding which some much debated poet once wrote about as "beautiful." This owner of a wealthy and weatherly name summoned her chauffeur and bade him bear her speedily to Lakewood. The chauffeur speeded so swiftly that it was eighteen hours later when he and his employers arrived at their destination. The condition of the eighty miles of road over which this wonderful example of what an automobile failed to do is best judged by comparing the eighteen hours the automobile took with the eight and one-half hours that were required for a four-horse coach to be driven over the same route on the same day.

But I haven't the slightest doubt the lady who took the automobile ride was satisfied, because next day her trip was duly written up in all the dailies, and the story of her adventures was given a scare head the size of which certainly must have made even the prize fighters and chorus ladies on upper Broadway green with envy. In describing the thrilling experiences of this wonderful trip I don't think I ever read anything more thrilling than where in the course of her story the fair owner of the automobile told of how she, the automobile and the chauffeur finally reached a little New-Jersey roadside hotel, and after considerable trouble had succeeded in waking up the landlord, only to be informed by him that that hotel wasn't doing any sort of business, particularly automobile business, at 3 o'clock on a winter's morning. Said the lady to the reporter when he interviewed her about the affair: "Our whiskey flask was empty by this time, and you can imagine how we felt."

It would be a mighty queer reporter who could not imagine any one's feelings under such soul harrowing conditions of empty flaskness as the lady had set forth.

* * *

Capital and labor would commingle very much more freely in the automobile business if there weren't so many men in it trying to get capital without labor. Think that over.

* * *

A man who has lived in Europe for many years told me recently that the American's hypocritical fear of "the continental Sunday" had done more toward making the automobile a success than any other one thing. He said that when he first came back to this country he looked forward to the approach of Sunday with dread; there was no place for him to go and nothing to do in the way of amusing himself. Looking out on Fifth avenue from the windows of his club and studying the Sunday promenade there soon suggested a remedy, however. He noted there was a regular hegira of automobiles out of the city on Sunday mornings and return thereof on Sunday evenings. He was not slow to take the hint and to join the procession, with the result that he, like the others, is now happier and healthier, all because of the freedom begotten of the automobile's ability to get away from unpleasant surroundings while carrying its fortunate owners along with it.

* * *

"I was hit by a scorcher," he said with a curse,
When the men with the ambulance found him,
"And if I had my way he'd be scorching still worse,
With a strong smell of brimstone around him."

* * *

I won't mention any names, but it seems to have dawned upon some of those wonder workers who are anxious to tell the reporters the marvellous things they are going to do in the way of vehicular propulsion that it is much easier to let a thing go than it is to make it go. Automobiles are not exceptions to this rule.

* * *

I quite agree with the gentleman who told the members of the N. A. A. M. at their annual meeting that a leisurely fourteen miles an hour procession of motor vehicles over fairly good roads is not an "indurance test" of anything, unless perhaps it be of the patience of their drivers. Still, there are a few automobiles that can't survive even such a jaunt.

THE COMMENTATOR.

GOOD ROADS AND CANALS

The Argument in Favor of one Appropriation for Both—A Long Wait Otherwise.

On the last day of the show in Madison Square Garden State Senator J. P. Allds met the Hon. George R. Bidwell in one of the aisles, and the talk between them turned at once to the subject of good roads. Senator Allds said he thought that any bill asking for several millions of dollars under the Higbie-Armstrong law would die in committee. The farmers would be against it. Under that plan the farmers had to feel the tax twice, and they would fight such an appropriation, but would support one which did not involve a direct tax on them. Senator Allds said he was of the opinion that the State should build the main roads anyhow and leave only the crossroads from the main highways to the county seat to be built by the farmers under the Higbie-Armstrong law. He recommended that the good roads people make a bold move and ask for an appropriation of $50,000,000, incorporated with the canal appropriation. This, he said, would be a measure that the farmers would support.

The suggestion seemed to be well received by those to whom Senator Allds mentioned it, but after his remarks had been published the Herald, of New York, criticised them editorially. It was fair, however, and the following day printed in full a letter from a reader who took exception to the editorial remarks. This letter contained such a sensible presentation of the situation that it is worthy of being read by all those who are working for improved highways in this State. The letter follows:

"To the Editor of The Herald:

"In your editorial this morning entitled 'Killing Two Birds with One Stone—Good Roads and Canals,' you refer to the coupling of the cost of canals and good roads together as a tricky and preposterous scheme, saying that this proposition for the betterment of roads is not made in good faith, but that it is made with the intention of killing both the Canal bill and the Good Roads bill.

"I desire to take issue with you in this matter. According to the report of the State Engineer and Surveyor of New York State, December 31 last, he had received petitions from forty-six counties asking for the improvement of 2,061 miles of highway. The counties and towns either had appropriated or were ready to appropriate their share of this expense, amounting in round figures to $8,000,000. The State last year appropriated $795,000 as its share, and if it continues to appropriate this sum each year it will take all of ten years before it can have appropriated the whole $8,000,000 required.

"The farmers throughout the State are not willing to wait ten years for the building of these roads, and, indeed, there are many counties and towns that are desirous of sending in petitions, but they are deterred because there seems, unless the State binds itself to build the roads, but little prospect of their wants being filled.

"It has been claimed that a proposition covering two things cannot be submitted to the people at the same time; that a plan to bond the State for $82,000,000 for canals and $50,000,000 for roads would not be legal. Why not submit a proposition to band the State for $132,000,000 for internal improvements—$82,000,000 for canals and $50,000,000 for roads? Are they not both internal improvements?

"I am sure that many farmers of the State will admit that the cities of New York and Buffalo, paying as they do a large proportion of the taxes, ought to have the canal, but they also feel that the Republican party owes a great deal to the farmer vote. What did the city of New York do for the Republican party at the last election? The Democratic majority in greater New York was 122,633, and had it not been for the Republican vote up the State, which gave but a narrow plurality of 8,803 votes, thus overcoming the great Democratic majority in New York City, the State would have gone Democratic. The farmer feels that on this occasion he saved the State, and that therefore the Republican party owes it to him to give him the good roads which he needs. It is a fact that according to the last United States census the value of farming lands in this State during the ten years preceding 1900 decreased $80,000,000, and I believe, any many others believe, that if the commercial supremacy of this State is to be retained it must be by improving the farming values by the building of good roads. There is no question but what the building of these State highways improves the value of properties near them. I know of one instance where because of the building of a State road in Westchester County a farm which was offered for sale at $3,500, and could not be sold, was recently sold for $7,000. I was told the other day by one of the board of supervisors of Orange County that farm values had increased over 25 per cent wherever a State road was built.

"I am sure that the up State farmer does not object to New York and Buffalo having the canal improved, although it brings the Western farmer into competition with him by bringing his produce to this State at a low rate, provided he at the same time secures better means of transportation over his country roads. The estimated cost per ton per mile over these roads is now 25 cents. If this can be reduced, not only is the farmer benefited, but the dweller in the city is also helped because the cost of transportation of foodstuffs to the city is reduced.

"A BELIEVER IN IMPROVED ROADS."

As the question of the good roads appropriation in New York State for 1903 is now pending before the State legislature, and President Shattuck of the Automobile Club and other prominent workers in the cause are at Albany seeking to obtain the best possible concessions, the facts about the situation in the State are of peculiar interest at the time.

While New York State leads all the other States in many things, yet she stands but seventh in the matter of railway mileage, having only 8,114 miles of railroad. The States of Illinois, Pennsylvania, Iowa, Ohio, Texas and Michigan have more miles of railway than this State. During the year 1901 the State of New York only increased its railway mileage by nineteen miles, while the State of Illinois increased hers by 180, the State of Ohio by 126, Michigan by 148 and Texas by 574 miles. This small increase is due to the fact that the railways of this State are controlled by a few great corporations, which are not at all interested in developing the resources of the State of New York, but simply care to develop their Western connections so as to bring produce to New York and have it compete with what is raised by the New York farmer.

In this State, according to the State Engineer's estimate, there are approximately 75,000 miles of highway—that is, wagon roads—and to maintain the commercial supremacy of the State it is essential, as the railways do not develop the State by building more miles of track, that those highways should be improved so that the farm produce may be more economically taken to the towns and railways.

Farming communities are unable to pay the cost of this improvement unaided, and the State therefore passed a law called the Higbie-Armstrong law, under which the State undertakes to pay half the cost of improving our roads. Since this law went into operation, some five years ago, 186 miles of State road have been built and 167 miles are in process of construction. As was pointed out by the Herald's correspondent, petitions have been received by the State Engineer for the improvement of highways amounting to 2,061 miles, and the towns and counties have appropriated, or are ready to appropriate, the sum of $8,000,000 for this improvement, and are only waiting for the State to appropriate a like amount so that these roads may be built. Last year the State appropriated for this purpose the sum of $795,000, and if each year from now on a similar amount is appropriated it will take about ten years to complete all the roads petitioned for. Many of the farmers of the State feel that they cannot wait so long a time to have their roads improved.

Governor Odell seems to appreciate the great demand [illegible] this State, for in his [illegible] legislature he said:

"The building of good roads has continued during the last year with gratifying results. So great is the demand for State aid that it will soon become necessary to have recourse to bond issues to meet these increasing obligations. If, therefore, any extension of time for the payment of bonds is authorized for canal improvement it should be made applicable for this purpose also."

ATTACKS COCKS LAW

One of its Victims Assails its Contitutionality—Court Reserves Decision.

For a statute that has been attacked on nearly every possible side, the malodorous Cocks law possesses remarkable vitality. This week it came up again, and its constitutionality was assailed on a new ground—that of its contravention of the Fourteenth Amendment.

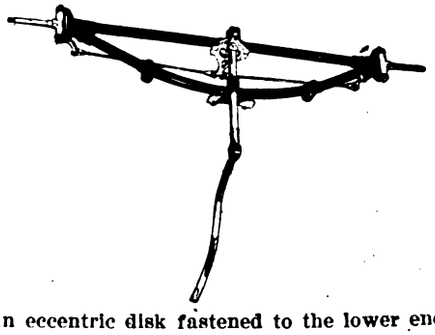
In the Appellate Division on Tuesday ex-Assistant District Attorney John D. Lindsay, in arguing an appeal taken by François Guichane, Archer Milton Huntington's chauffeur, from a judgment of the Court of Special Sessions, convicting him of a violation of the automobile speed law, attacked the statute on constitutional grounds.

Mr. Lindsay contended that the law contravened the Fourteenth Amendment to the United States constitution in that it denied to persons within the jurisdiction of this State the equal protection of the laws. While the law, said he, provided for the punishment of drivers of horses drawing vehicles or the operators of motor cars along public highways at excessive speed, it permitted any one else not within those two classes to drive or travel on the public roads at any rate of speed. He called attention to the fact that the law was silent in regard to everything except vehicles drawn by horses or motor vehicles. No penalty was provided for driving horses not drawing vehicles. The statute made no provision for the punishment of bicycle riders or the operators of other similar vehicles not coming within the motor vehicle class.

A statute, continued Mr. Lindsay, which forbade one man or class of men to do an act which other men or class of men were left at liberty to do, clearly would be invalid as not constituting due process of law, and that was precisely the sort of discrimination wrought by the law under discussion. Decision was reserved.

To Oppose Connecticut Repeal.

Connecticut autoists are not going to sit supinely by and have the admirable law of the State relating to automobile speed changed. Pointing to the fact that it has worked perfectly since its adoption nearly two years ago and is regarded as a model [illegible] is to be [illegible] bill increasing the maximum speed down from fifteen to eight miles an hour. The Hartford Automobile Club opposes it, and has taken steps to make its opposition effective. On Monday the Automobile Club of Bridgeport took action also. It decided to send a committee to Hartford to co-operate with the club of that city in opposing the passage of the bill.



Foster Reorganization Effected.

Negotiations that have been pending for some little time looking to a reorganization of the Foster Automobile Co., Rochester, N. Y., have been brought to a successful conclusion, and the reorganization is now an accomplished fact. New capital has been subscribed and a new and vigorous policy will be at once inaugurated.

Meads' Eccentric Steering Device.

An ingenious steering device possessing some novel features has been patented and is being marketed by W. L. Mead, South Orange, N. J. With it in the centre position the wheels of the car will run steadily and without deflection, while but little pressure on the lever is required to turn the steering wheels to the right or the left.

The method of construction is as follows:

An eccentric disk fastened to the lower end of the steering post is surrounded by an eccentric strap, which forms part of a lever to which the links for the steering knuckles are connected. The lever is provided with an elongated slot, through which passes a pin or bolt fastened upon the front axle, which bolt acts as a pivot.

As shown, the device is applied to a lever steering gear. But it is equally applicable to wheel steering, and its advantages are equally apparent.

The "Goodrich Girl."

The "Goodrich girl" of 1903 represents "Aida," who comes from out of the dim past and from the Far East, and is the daughter of a king and princess of the blood royal. In courtly phrase she suggests in the announcement that accompanies her beautiful likeness that "The King's court will remain in the state apartments in the royal palace night and day, to receive your orders, which can only reach the throne when addressed to The B. F. Goodrich Co., Akron, Ohio." The picture is exceedingly attractive and is a valuable addition to the beautiful series to which the Goodrich Company adds each year.

Solar in the East.

An Eastern office has been opened by the Badger Brass Mfg. Co., of Kenosha, Wis., at No. 11 Warren street, New York. A full stock of Solar lamps and parts will be carried in stock.

William Morgan, formerly sales manager for the Autocar Co., has been appointed manager of the Philadelphia branch of the Locomobile Co. of America.

YEAR'S EXPORTS TRIPLED

"Infant Industry" Makes a Good Showing for Twelve Months, Although December was "off."

For an "infant industry" the American automobile trade is doing uncommonly well in obtaining increasing recognition in foreign marts. The export returns for the year 1902, which have just been issued, show our foreign trade to have increased nearly 300 per cent. during the twelve months—from $367,371 in 1901 to $1,069,782 in 1902. The closing month was one of the very few that failed to develop a gain, the shipment aggregating in value $43,699, as against $65,451 in December, 1901. As yet the export statistics as they relate to automobiles are lumped under one head, and the exact distribution of the year's shipments is not, therefore, made plain.

Injured Employe Loses Suit.

After a trial lasting two days the B. F. Goodrich Co., the well known tire makers, of Akron, Ohio, on Monday of last week won a case of interest to manufacturers generally.

David Davis, an employe of the company, was injured while working at a calender in their factory on April 10, 1899, with the result that his left arm had to be amputated. He sued for $30,000 damages early in 1900, and the case came on trial on January 21 last. Davis alleged that it was through the negligence of the company and defects in the machinery that he was hurt. The defence was that he knew the nature of his work and of the machinery on which he was employed, and was hurt by his own negligence. Davis preferred a contest to a settlement out of court, but failed to prove to the jury that the machinery was defective.

Recent Incorporation.

East Orange, N. J.—Tennant Auto-Tire Co., with $300,000 capital, to manufacture pneumatic tires. Incorporators: Fred. L. Palmer, Chas. O. Geyer, Frank C. Ferguson.

Cranford, N. J.—United Motor and Vehicle Co., with $300,000 capital, to manufacture motor vehicles. Incorporators: Eugene W. Austin, Austin E. Kirby, Wm. Hughes.

Gillette Incorporates.

With a capital of $3,000, $1,000 of which has been paid in, the Gillette Athletic Goods Corporation has been organized at Hartford, Conn. A retail business in automobiles, bicycles and athletics goods will be transacter. Norman Gillette is president and treasurer, H. B. Freeman, jr., vice-president, and J. J. McKone, secretary.

Changes its Name.

In order to avoid confliction with other concerns with somewhat similar titles, the Reading Automobile & Gear Co., of Reading, Pa., has changed its name to the Relay Motor Car Co. The change does not otherwise affect the concern.

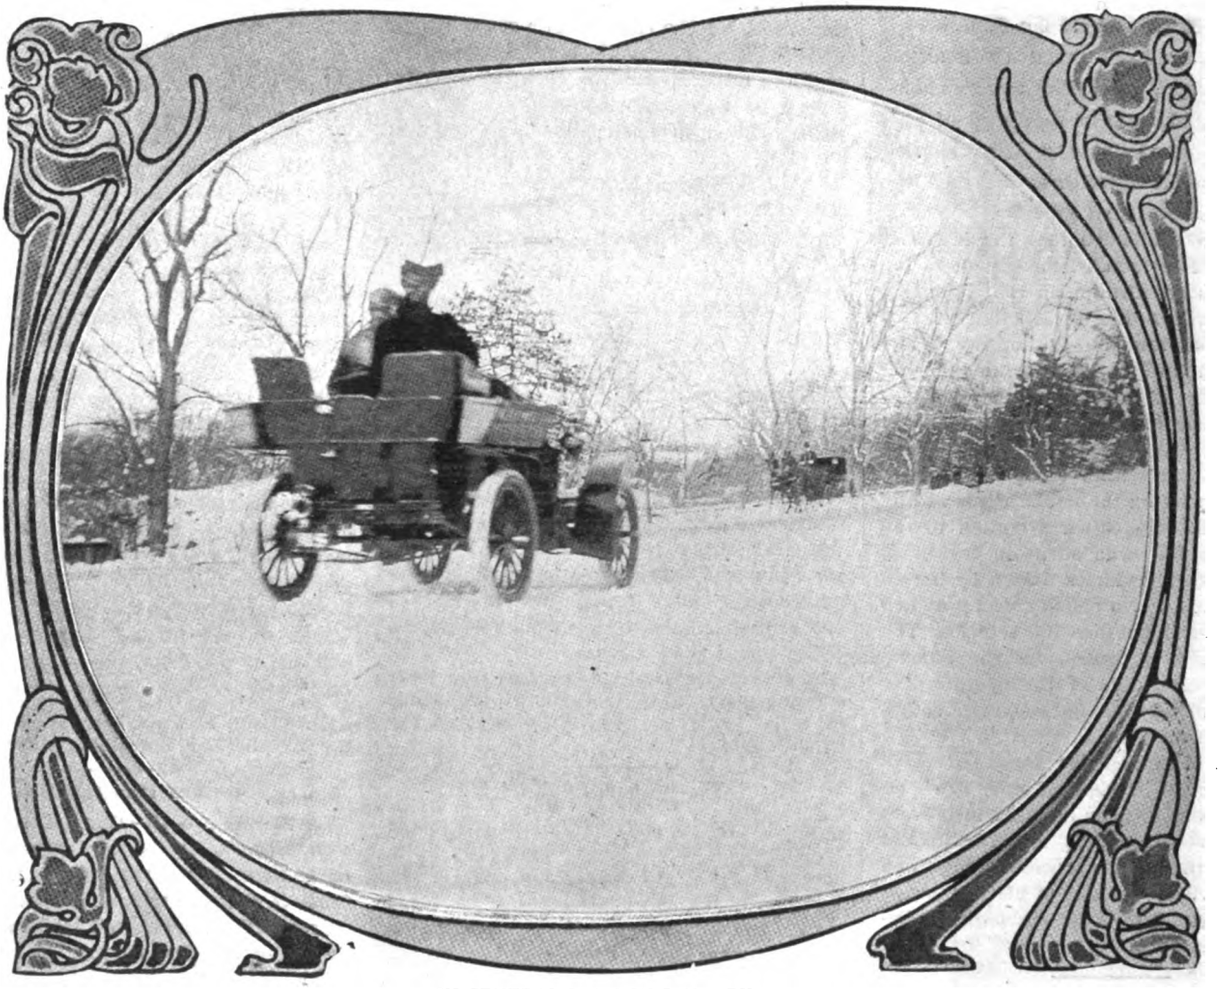
MOBILE'S GREAT GARAGE

Features of the Biggest Storage Place Yet Opened—New Ideas to Be Used.

Spaciousness, style and completeness of appointment are characteristics of the latest automobile depots established or projected, and the indications are that before long there will be in New York City several garages and salesrooms as well equipped as those of Europe.

Among the latest places to be opened, the metropolitan headquarters of the Mobile Company of America, at Broadway and Fifty-fourth street, will be one on a scale hard to rival. Possession of the building was obtained by the company on February 1, and it will be formally opened on February 15. Through the courtesy of General Manager E. B. Galleher, a Motor World man made a tour of the building on Tuesday and had indicated to him how the big place would be laid out for work. The building has seven stories above a basement and a cellar, and the size of its floors may be imagined from the fact that on the third and fourth floors, which are being temporarily used by Burr & Co., the former tenants, there are now standing eighty-six carriages of different sizes, many of them two-horse broughams, surreys, etc. It is calculated that beside the room used for offices, show rooms, repair shops and so on, there will be room aplenty for 200 automobiles.



From the Fifty-fourth street side there is a driveway directly on to an elevator that is roomy enough to take on the largest sort of touring car. If the car is to be washed it goes down to the cellar, where a washing table, 23 by 27 feet, has been just completed. The cellar is cemented and exceptionally dry, and it, as well as the floors above, will be used for storage. Another part of the cellar is set apart for the use of chauffeurs, with lockers and wash room for them.

It is striking to find the floor plans and fittings of the building as perfectly adapted to the requirements of an automobile establishment as if it had been especially built for the purpose. This is due to its having been laid out for a carriage repository by Burr & Co. The show room will be on the main floor, which is lighted by windows on two sides. Here are found already installed two comforfably arranged and heated waiting rooms.

The second floor will be used for offices and the third, fourth, fifth and sixth floors for storage. On the seventh floor will be a repair shop almost as extensive as a small factory, with power machinery, painting and varnishing rooms and upholstering rooms, which are already there, having been built by the former tenant.

An idea of General Manager Galleher that will be put into operation in this big and elaborate establishment is that of having every car carefully inspected by expert workmen every time it is brought into the garage. No charge will be made for this, but it will serve the purpose of informing the manager and the owner of the condition of the car when brought in from the road. If a cracked gearcase, loose flywheel or any other trouble is found that may have escaped the notice of the owner, he will be promptly notified by card of the repairs needed and an estimate of the cost of them will be sent to him at the same time, so that he will not unwittingly have the risk of taking out a car that is in unfit condition.

A. S. Robinson, lately with the Searchmont Company, has joined the Mobile forces as the personal assistant of Manager Galleher.

IN CENTRAL PARK IN JANUARY.

Fournier says the authorities here should allow at least one long-distance speed test every year on the road. He is quite correct, and there probably will be if properly approached and proper safeguards against accidents are assured.

BRANDES AND THE CUDELLS

Who he is and Something About his German Cars—Big Order Booked for Wagons.

There are not many men who compress into but little over a score of years so much activity and industry as stands to the credit of J. C. Brandes, who came to this country a short time ago to represent Cudell & Co., of Aix-la-Chapelle.

On the one hand, he has behind him a career with the Krupp and the Maxim-Vicker companies, those gigantic concerns which stand for so much in the foreign industrial world; on the other, he has served an apprenticeship in the German army, having been wounded during the march to Peking

in the Chinese war—and still holds his commission as lieutenant, ready to accept service at the Kaiser's call. In each capacity the qualities of brain and body are called upin to do their utmost, and the graduate from such schools is, ipse facto, stamped as a man of unusual parts.

Having made, in addition, a thorough study of the automobile business, Mr. Brandes is remarkably well equipped to make a success of his undertaking. A pleasing personality, and a quiet, confident air, backed oy goods of acknowledged merit, all tend to lesson the difficulty of his task, and the amount of success that has already fallen to him is assurance that the matter is in safe hands.

Some misconception having arisen concerning the matter, it is timely to say that Mr. Brandes is the sole United States agent for Cudell & Co., Aix-la-Chapelle, one of the largest automobile concerns in Europe. With offices at No. 28 West Thirty-third street, and garage at No. 121-123 West Thirty-first street, this city, he will market 6, 8, 12 and 16 horsepower gasolene motorettes and touring cars, and also delivery wagons and trucks. The first consignment is already here, and large shipments are on the way. These cars will be sold at prices considerably lower than other cars of corresponding quality—probably as much as 20 per cent.

The illustration shows one of the 12 horsepower cars, which differs slightly from the later models of this size. In the latter, as well as future shipments of cars, the tonneau body is longer and more roomy, the steering column has a more pronounced rake and in other respects improvements have been made. There will be four speeds forward and a reverse, all operated by one lever.

Although in this country but such a short time Mr. Brandes has been hard at work. One day last week he drove a car 180 miles on the Boston Post road, giving a prospective purchaser a splendid demonstration of the good qualities of the car.

In the commercial vehicle line a contract has already been closed with one of the largest department stores in the city for a number of Cudell delivery wagons, which, if its terms were known, would astonish many people in the trade.

Claimed Better Than Throttling.

"The Panhard idea of supplying extra power just when it is required is better than merely working a large engine very much throttled down, which means an increased cost in running, as a considerable amount of wear and tear, to say nothing of unnecessary friction, is taking place," remarks a transatlantic writer.

"If, instead of gearing, there was the power to throw into action one or more additional cylinders when hill work or bad roads are encountered, and if the mechanism were so arranged that when not required for use these cylinders should be entirely at rest, the result might be better. A further advantage would be that in the event of a breakdown occurring to what may be called the main engine, it would be possible to run the car with the extra cylinders by a very simple alteration of the machinery. The cost of constructing a small motor of about 2 horsepower is not great, and if two or three of these were so arranged that they could be brought into action to assist the main engine when the latter dropped below a certain rate the result would be better, and the cost not much greater than the very expensive gear boxes now provided."

SOURCE OF WEAK SPARKS

Little-Suspected Cause of Trouble, Where to Seek for and how to Correct it.

In setting up a new sparking plug the first thing to be seen to is that the ends of the platinum sparking points are flat and parallel. In cutting off the wire for these points a pair of cutting pliers are used, with the result that the ends are left in the shape of a broad V. Now, as the sharp edge of the V are likely to be at any angle to one another, it generally happens that the actual sparking areas are but little more than equal to the diameter of a very small pin. The natural result is that a weak spark is produced, and the novice may look for a very long time before finding the real cause of it. What is required for the highest point of efficiency is two flat surfaces parallel to and opposite one another—simple conditions, but difficult to fulfil.

To attain the best conditions for the sparking plug points it is first necessary to reduce the V points to a flat surface, and this is best done with a jeweller's or any thin flat file. Having got the points up flat and parallel, they must next be set up to their correct distance. This distance is variously given as one millimetre, one-thirty-second of an inch and the thickness of a visiting card—whatever that may be—but the distance really depends upon the power of the coil and the resistance offered by the compression of the cylinder charge. Naturally, a powerful coil with a good voltage behind it will give a "fat" and hot spark, but this may easily be offset to a certain extent by high compression. The best practice is, then, to find by experiment the most efficient position of the points and to have a permanent guide in the form of a gauge to set them up to. This gauge may be a piece of sheet metal, and once obtained should be religiously preserved.

To set up the sparking points correctly a pair of flat nosed toggle jointed pliers are required. This type of tool is specified as its jaws are always parallel, and by its use the points may always be set correctly in line without trouble, while for other purposes they are equally useful. The keeping of the points parallel vertically is a matter of judgment by the eye, while the gauge looks after the distance. It is advisable to always set up and test spare plugs before putting them into the "spares" compartment in the car or tool bag, as this will frequently save time and trouble on the road.

To charge the average runabout battery there are required about seventy-five ampere hours of electricity a day. An ampere hour is one ampere flowing for one hour.

The Cadillac gasolene car will hereafter be handled by John Wanamaker at his New York and Philadelphia stores.

Electrical Device From Somerville.

Several electrical devices of more than ordinary interest have been brought out for the 1903 season by the American Coil Co., West Somerville, Mass. Among them are an entirely new automatic spark coil, a new dynamo called the Little Wonder and a pocket ammeter.

The automatic coil is so constructed as to operate both as a vibrator and plain coil—that is. it operates as a vibrator coil giving a shower of sparks for starting and up to a speed at which the common vibrator coil would refuse to operate, when it automatically changes to a plain coil giving a single make and break spark, and the engine may be speeded to any speed desired without the coil refusing to work, and as soon as the engine is slowed down the coil again becomes a vibrator coil, as before. The advantages of such a coil are apparent, as the make and break device used with this coil is the same as that used on a plain coil, having short contact and a quick break, while the contact on the ordinary vibrator coil must have a long contact in order that the engine may be run at a fairly high rate of speed. This long contact is very hard on the batteries, while the short contact allowed by the use of the new coil brings the battery consumption down to that of the plain coil. There is little liability of vibrator sticking, and even if it does stick, instead of refusing to spark, as is the case with the ordinary vibrator coil, this one works right along as a plain coil.

The Little Wonder dynamo is very compact, and has a system of storage in the base which does away with all use for extra batteries for starting, as the engine is started from the storage, while this storage is kept constant by the dynamo. The storage is very compact, all being confined in the small base of the dynamo, which is only 1½ inch by 4 inches by 6 inches. The dynamo, storage and all will weigh less than fourteen pounds. The bearings of the dynamo are very long, and the oiling is done by rings running in oil cups.

The pocket ammeter measures up to fifteen amperes, and is claimed by the company to be the only reliable pocket ammeter on the market. While not as absolutely correct as an instrument costing $100 or $150, it will measure the output of a set of cells within one-half ampere, and this is near enough for all practical purposes. Every owner or operator of a gasolene car using electric ignition should have one of these little instruments, as by its use he is able to tell the exact state of his batteries at all times.

The Week's Exports.

Cuba.—1 case motor vehicles, $553.

London.—12 cases motor vehicles, $845.

Liverpool.—28 cases motor vehicles, $13,305.

Two Big Tournaments in Prospect.

Plans are on foot to inaugurate automobile racing on an extensive scale at Charter Oak Park, Hartford, Conn., and Oakley Park, Cincinnati, Ohio, both owned by Andrew Welch, of the former place.

It is proposed to start off at Charter Oak on May 30 and at Oakley on July 4, Henry Fournier to be the star on both occasions if he can be induced to come here in time. Big purses, variously stated as amounting from $10,000 to $50,000, will be offered, and the best racing men of this country and Europe secured.

"What they have in France is what we are going to have right at Charter Oak," Welch told a Hartford reporter. "I took breakfast with Fournier the other morning in New York. 'I am out for the money,' he said. 'You hang up big purses and you will find all of the cracks at Charter Oak.'

"Now, that is just what we are going to do. The meeting will attract from all over the country, will be the only big one, and the attendance will justify the posting of $50,000 worth of prizes."

Locomobile's New Branch in Boston.

Having outgrown their old quarters at No. 332 Boylston street, Boston, the Locomobile Co. of America has been obliged to remove to No. 13-15 Berkeley street, where, instead of being confined to a single floor and basement, the entire building is occupied.

Chicago Automobile Show

COLISEUM, FEBRUARY 14-21.

REDUCED RAILROAD RATES.

The Central Passenger Association
Western Passenger Association
Trunk Line Association
New England Association

have granted reduced rates an account of the Good Roads Convention of the National Association of Automobile Manufacturers, to be held at the Coliseum, Chicago, during the Chicago Automobile Show, Feb. 14 to 21, 1903,

These associations cover all the territory between Cheyenne, Wyo., (including all Points in Colorado) and the Atlantic coast.

Note These Instructions Carefully.

On purchasing ticket for the trip to Chicago, ask the ticket agent for a certificate **on account of the Good Roads Convention of the National Association of Automobile Manufacturers.**

On your arrival at the Coliseum present it at once to the railroad agent who will be in attendance from Monday to Saturday. He will certify that you have been in attendance, but it is necessary for him to know that there are at least 100 holders of certificates, hence the necessity of delivering them to him immediately on arrival.

Your certificate, when presented at the depot, will entitle you to buy your return ticket at one-third of the regular fare,

Tickets for return journey will be furnished only on certificates dated not more than three days before the opening of the convention, nor more than two days after the first day of the convention, and presented within three days after convention closes. Sunday will not be reckoned as one of the three days either before the opening date or after the closing date, and all return tickets will be for continuous passage.

EVERY PROMINENT MAKER WILL EXHIBIT.

Morning Sessions Free to the Trade.

SAMUEL A. MILES, Mgr., Monon Bldg., CHICAGO.

TALKED OF THE SHOW

A. C. A. Members Exchange Views and Extol American Cars—Electrical Makers Blamed.

A call for the informal Tuesday night talk at the Automobile Club of America this week was responded to by a score of members, who wanted to hear others talk about "Lessons from the Automobile Exhibition." In the absence of President Shattuck, who was at Albany, busy looking after the proposed changes in the automobile laws, First Vice-President W. E. Scarritt presided, and he launched the discussion.

Mr. Scarritt extolled the exhibits at the show and the affair as a whole in lavish terms. He laughingly remarked that while many undoubtedly lied cheerfully about their sales, there was no doubt but what the sales were tremendous, and he predicted unflinchingly that within three or four months there will be a great dearth of machines. Both in his preliminary remarks and in those which he dropped when calling upon different members to speak, Mr. Scarritt repeatedly referred chidingly to the proneness of Americans to pay exorbitant prices for foreign made cars. He said:

"A man buys a Mercedes for $12,000, six dollars a pound mark you. Forty-five per cent. of that is for duty, 25 per cent. more is for the agent and another fat percentage is for the name. It is a grand car, the greatest in the world—I wish I had three or four of them—but what a lot of money to pay for what is not in the car. What an encouragement it is to American manufacturers to know that such an amount of money will be gladly paid for a perfect car! In this is the greatest reason to urge America only to build the best. The assurance is at hand that plenty are willing to pay for it. I believe that the American maker is even now on the eve of bringing out cars as good or very nearly as good as any made abroad."

George A. Adams said that in his opinion what is wanted is greater simplicity in the American car, because there are not many who can afford a highly complicated machine and a high priced chauffeur to take care of it. His idea was that a car of one or two cylinders which the ordinary man can handle himself is what is wanted, and he stated that in this respect we are ahead of the foreigners and should keep ahead. He called attention to the fact that in the Boston endurance run the cars of simpler construction got through better than the big multi-cylinder affairs. He thought that the show was a grand one which revealed the fact that the majority of manufacturers are trying to make a standard article.

Fred. G. Bourne said he was impressed at the show with the progress made by American makers in copying foreign machines. He was himself a Mercedes man, and he dwelt eulogistically upon the beautiful running qualities of that car. He admitted though that he had seen many cars at the show which were close seconds to the foreign built cars, and told of a trip with A. L. Riker in a gasolene Locomobile, which, he said, was a revelation to him, for it could be run fast or slow with an ease and noiselessness nearly equal to that of the Mercedes.

E. T. Birdsall said that while it might seem that there was a fad at present for mechanically operated valves, steel frames and multi-cylinder engines, he believed that the four-cylinder type of engine had come to stay.

A. L. McMurtry, fresh from the Paris show, was inclined to scoff at American construction and to believe that the work done here in no way equals that of the French. He said that in castings, in ignition devices and even tires we are far behind the Europeans. The American maker is badly handicapped, he thinks, by the people in the electrical business, who are to blame for not having arisen to the occasion. It makes no difference whether we build one, two or four cylinder engines and have mechanical valves or not, in his opinion, so long as our ignition devices remain as faulty as they are. He condemned the dry cells, of which he said he had not seen one in Paris, and he condemned the poor spark coils and the careless methods of wiring, using a breakable copper wire for the entire reach and then twisting the end of it about the spark plug. He also condemned the tendency of American makers to cling to sun and planet gearing, which he contends gets hot very quickly when the car is being run on the low speed gear. Under questioning about mechanical valves and other technical matters, Mr. McMurtry was very interesting.

Emerson Brooks said he believed the aluminum body had come to stay, and in his opinion the time is near at hand when the American manufacturer of automobiles will follow the example of the French and sell the chassis only, allowing the customer to get his own carriage body anywhere he chooses.

Robert L. Niles in a very humorous talk said he was disappointed in the show because there was nothing there for a poor man.

A luncheon followed the talk.

First Run Called.

The first run for 1903 of the Automobile Club of America will be held on Monday, February 23, and it will be from Lakewood to New York. The members are to report at the Lakewood Hotel on the Saturday night before at 6 o'clock. Sunday will be spent in making short trips through the adjacent country, and presumably the private speedway recently constructed near there will be tested.

The start for New York will be made at 9 o'clock Monday morning. This is an unusually early date for a club run, and the idea is that it will prove to the public that the cars of the club members are not simply fair weather vehicles

COMPETING WITH STREET CARS

John Brisben Walker's Enlarged Rapid Transit Plans—No Standing in his Motor Cars.

With John Brisben Walker and the Mobile Company of America behind it, a plan is being developed for an addition to the rapid transit facilities of New York City that will surprise the residents.

The Mobile Rapid Transit Company has been formed, and a bill has been introduced into the New York State Legislature by Senator Foley, defining the privileges of companies operating stage lines. This bill is supposed to be largely in the interest of the Mobile Rapid Transit Company.

The plans, as far as formulated, are for the company to put into operation five thousand steam coaches, each capable of seating fourteen passengers, and operating these on a number of different direct routes. The cars will run in the main lines of travel, but will be operated differently from stages, in that they will not be constantly stopping to let off or take on passengers. No more passengers than there are seats for will be taken aboard at any time, and when the cars are filled they will not stop en route to take on another fare, but they will let off passengers who do not want to go the length of the route.

The routes will be between points of travel, such as ferries, railroad stations, the Bridge and so on. Lines will probably be operated from the shopping district up Fifth avenue to 110th street, from the Grand Central Depot to the various ferries and across town between railroad ferries. It is probable also that the stage lines operated by Mr. Walker something more than a year ago, from Wall street ferry to Courtlandt and Twenty-third street ferries, will be revived. This was run long enough to demonstrate the practicability of the plan, although no money was made from the venture.

Mr. Walker says he is satisfied that automobile coaches must solve the problem of the overcrowded streets and railway cars of New York. In his 'busses there will be no straps, for no one will be allowed to stand.

"New" Things That are not New.

Many alleged new things are really old ones rejuvenated. An instance of this is the three cylinder motor, which was brought out with such a flourish of trumpets at the Paris show. It is well known that the Gasmobile and the Duryea used the triple cylinder motor for years, and now it has been "discovered" that a French car, the Cannoise, with a similar engine, was built and in use five years ago. In this case its designer had experimented with four and two cylinder motors, but dropped both, being convinced that the three or six cylindered engine alone could be properly and effectively balanced.

METEORS FROM READING

Steamers all and a Tonneau Amongst Them—Some of the Features Incorporated.

One of the steam makers who possess the courage of their convictions and carry through an aggressive policy is the Meteor Engineering Co., Reading, Pa. This enterprising concern not only proceeds along sound lines, but it had the foresight to see the opportunity that exists for a type of car out of the ordinary, and by grasping it place itself in a highly advantageous position.

In addition to its runabout and touring car models, the Meteor company is now producing a steam tonneau of the most approved modern type. In appearance it is scarcely distinguishable from a gasolene car, it having the same long, low and massive appearance, with bonnet, wheel steering and other paraphernalia formerly always associated with the forengn cars. This model received a very large amount of attention at the Madison Square Garden show, and bids fair to prove extremely popular.

This car, which has detachable tonneau seats and divided front seats, lists at $2,000. It is fitted with a 10 horsepower engine having 3½x4 inch cylinders, of slide valve Stevenson link motion type, which is placed in a horizontal position under the footboard, making it very convenient and easy of access. It is covered with a dust proof case from the bottom, and protected from the top by the footboard. The boiler is placed in the front under a bonnet, as is all the piping. The boiler is of 20 inches diameter, with 713 flues, and three-sixteenth inch steel shell, and has a heating surface of about 100 square feet. The burner is of large diameter, and is fitted to the boiler in a very neat manner; the shell of the boiler extends down considerably beyond the crown sheet, which answers for the burner case. The burner is a three compartment burner, with three mixing tubes.

The starting apparatus is a patented device and is an unusually simple method for starting the fire, no auxiliary torch of any kind being required. The car is fitted with the Overman steam water and air pumps, as well as a forced draught and steam syphon, or water lift. The non-breakable Klinger water guage, steam and air gauges, as well as the valve wheels for operating syphon, forced draught, water and air pumps, gasolene and auxiliary throttle valves, are directly in front and within easy reach of the operator. The lubricator is also in a very convenient place, directly in the centre of the carriage on the front of the footboard. This is a positive feed to the cylinders, connected to the water pump plunger, and is sure to feed oil if the car is driven by steam pressure, coasting, or otherwise.

The piping throughout is of one-quarter inch diameter, thus preventing any possibility of their clogging. The gasolene tank, of twelve gallon capacity, is placed in the front end under the seat. The water tank, of forty-five gallon capacity, extends from the rear end of the front seat down under the footboard of the tonneau seats, and extends four inches under the sills of the body. The filling caps for both water and gasolene tanks are under the left cushion of the front seat. The car is fitted with a combined feed water heater and muffler.

The driving is done from the engine to a counter-shaft by a heavy roller chain, and from the ends of the counter-shaft to each rear wheel by separate chains. The equalizing gear is directly in the centre of the counter-shaft. A very desirable feature of the counter-shaft is the flexible manner in which it is hung, and not bolted to the body or chassis on both ends. The counter-shaft is hung at its centre on a rocker plate, fastened to a cross section of angle iron. The feature of this construction is that the counter-shaft bearings and sprockets are always in perfect alignment with the rear axle bearings and sprockets, and are not affected by the vibration and twisting of the body, which is sure to result with a long wheel base in driving over uneven places, no matter how strongly the car may be supported by angle or channel iron.

There are two double acting band brakes on each rear hub connected to a single lever. The lever is of a locking and ratchet variety, which locks the brake in a fixed position without compelling the operator to keep his foot on same continually. The steering is done by a wheel, and the main throttle is operated directly in the centre of the large steering wheel. The reversing is done by a lever on the side of the car, and the by-pass is placed just outside of the body.

The wheels are of the popular artillery pattern, 30 inches in diameter, with 3* inch detachable tires. The front and rear wheels have ball bearings of large diameter, of a construction used for years with perfect success. The angle iron frame of the chassis is mounted on four eliptic springs.

Single Cylinder's Doom Predicted.

"It does not need much foresight to see that the days of the single cylinder engine, even for small cars, are numbered. Nobody who has had experience of the double cylinder type can fail to admit the great advantages which that pattern gives, not only in comfort, but in actual wearing powers," says an advocate of the multiple cylinder type of car.

"It is now pretty well admitted that, even for a small car at least 5 horsepower or 6 horsepower is required, and, although motors of greater horsepower than this are constructed with single cylinders, the strain which such engines put upon the working parts of the car, and also upon themselves, is so great that the cost of upkeep—that is to say, of necessary repairs and replacements—is a considerable item, and would be saved, to a great extent, were a twin cylinder motor employed. Indeed, the tendency in France is to use four cylinders for even small cars.

"It may next be asked whether the cylinders shall be horizontal or vertical, and in this opinions differ very widely. So far as the high speed motors are concerned, the rule is to place the cylinders vertically, and there can be no doubt that with this position a better system of lubrication can be adopted. On the other hand, with slow speed engines the horizontal position is usually favored for the reason that it greatly reduces vibration and does not tend to set up that jumping action, when the car is running slowly, which is apparent with the vertical class of motor. But the slow speed engine is given to wear badly, so far as the bearings are concerned, owing to the thumping action to which they are subjected, and, therefore, they require more looking after."

Mors Workmen on Strike.

A strike, with a resulting lockout, has occurred at the Mors factory, at Paris, and if of long continuance will entail serious delays in deliveries. The trouble arose over the attempt of the workmen to obtain the dismissal of an unpopular foreman. The management stood by him and the men went out.

BAY STATE'S DRASTIC BILL

Forbids use of Cars Capable of Better Than 20 Miles and is Otherwise Obnoxious.

What the Bay State solons do not know about automobiles is indicated by a bill introduced in the Massachusetts legislature last week, one of the provisions of which prohibits the licensing of any car that can travel at a rate in excess of twenty miles an hour. The bill is a drastic one, as this clause indicates.

The measure, which has been referred to the Committee on Roads and Bridges, proposes that all automobiles and operators in the commonwealth shall be licensed by the Massachusetts Highway Commission, which, by the provisions of the bill, really becomes the supervisor of automobiles. The bill provides that no one shall use an automobile unless he or she is registered, which, if literally interpreted, will prevent in a great measure visitors from other States touring through Massachusetts.

The provision that is apt to cause the greatest trouble is, however, the section which provides that no automobile having a maximum speed of over twenty miles an hour, "or at that rate for any part of an hour," shall be licensed. Whether the claim of the maker, or user, or actual test will determine this is not stated.

The speed at which an automobile can be run outside city or town limits is placed at not exceeding fifteen miles an hour, and within city or town limits to eight miles an hour.

The bill further provides that all automobiles shall carry on the sides and back Roman numbers not less than four inches in height, and to correspond to the registration number granted by the Highway Commission. The penalty for violation of the registration clause is a fine of $100 or imprisonment for ten days, or both; the penalty for the infraction of the speed limit is a fine of $200 or imprisonment for a term not exceeding ten days.

The measure is only the first of a number of bills that are being prepared for presentation to the legislature. One has been prepared by the law and ordinance committee of the Massachusetts Automobile Club. It contains two sections, one limiting the speed to not over twenty miles an hour outside the city limits, and the other forbidding a town or city to limit the speed to less than twelve miles an hour, and giving park commissioners authority to make their own rules and regulations.

A second bill has been prepared by the club, and is of greater scope, although the speed requirements are practically the same as in the first bill. This bill requires all machines to have good and sufficient brakes, bell, horn or other signalling device; the owner's initials on each side of the machine. It provides that automobilists shall not be required to take out a license.

Another proposed bill, which it is understood was filed, provides for a uniform law throughout the State, the registering of all automobiles, numbers properly displayed, carrying of lamps in front and rear of machines, speed limit of twenty miles an hour in the country, fifteen miles an hour in open streets of cities, and eight miles an hour in the business section.

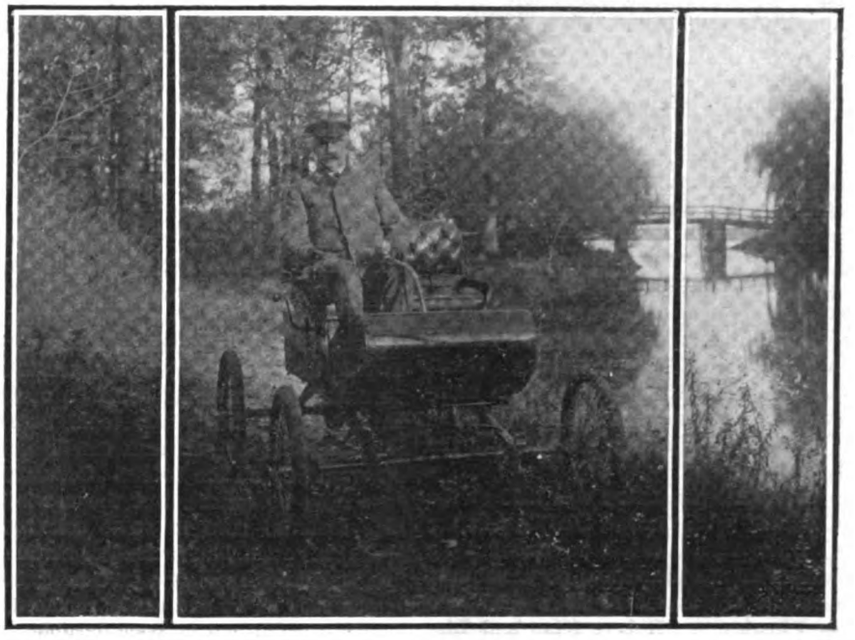
It is probable that still other bills will be introduced under a suspension of the rules when the legislature reconvenes.

Is President of Two Clubs.

It is not often that the same man is president of two automobile clubs, but through his election as president of the Pasadena Automobile Club Ellicott Evans has that distinction. He is president also of the Buffalo Automobile Club.

The other officers of the California organization are as follows: King Macomber, vice-president; C. B. Scoville, second vice-president and treasurer; J. T. Pugh, secretary, and the following, with the officers, a board of governors; J. T. Pugh, Tracy Drake, H. T. Kendall, H. J. Macomber, R. H. Gaylord and J. B. Miller.

One of the objects of the club is to discourage and, if possible, eliminate reckless speeding, and another object is to induce the City Council to moderate the speed laws, which at present declare that the auto shall not travel faster than eight miles an hour inside the city limits and four miles an hour across street crossings. They would like to have these rates of speed made twelve and eight miles, respectively. They will invite the councilmen to go riding with them, and will attempt to demonstrate that the speed limits are now too slow.



MAINE'S REASONABLE MEASURE

Law Introduced That is at Once Simple and Fair to all Concerned.

That rare thing, a bill drawn in the interests of autoists, rather than aimed at them, has been introduced in the Maine legislature. It provides for speeds of eight and twenty miles in the towns and country, respectively, uniform throughout the State. No license clause or other irksome and injudicious features are embodied in the measure, and it will in consequence be heartily supported by autoists through the country.

"The bill is good, cleanly drawn and fair, and we have great hopes that it will be passed," said A. M. Spear, of F. O. Bailey & Co., Portland. "There is surely great interest behind it, and it will be of signal benefit to motor carriage owners. At the legislature it was introduced by C. P. Hatch, of Portland, and there was also present at its introduction a considerable delegation from other towns and cities.

"We have hastened to present the bill because of the fear that some other parties might put in another which would deprive automobile drivers in this State of the rights and privileges which should be theirs by right. Were this bill passed it would bring to our State large numbers of tourists who have hitherto refrained from coming owing to the want of privileges which have existed in Maine."

AN OLDSMOBILE IN A PICTURESQUE SETTING.

A trial jury at Pittsburg, Pa., has disagreed and been discharged after listening to a case brought against the owner of an automobile by the occupants of a buggy whose horse became frightened, ran away and threw them over a bridge. The case was that of C. C. Smith and J. L. Smith and wife against Thomas Wittner. The jury was out twenty-four hours.

Preparing for Cold Snaps.

These are the days when it is wise to have ready in one's motor house, and stored away in glass or earthenware vessels for preference, sufficient anti-freezing solution to fill up one's water tank in case of a sudden cold snap. Frost usually finds one unprepared, whereas if the anti-freezing mixture is all ready for use it is a very simple matter to fill up the water tank with it.

As is well known, there are two excellent solutions for this purpose. One of these may be a mixture consisting of one part of glycerine and one part of water. It is expensive, but quite efficient. Another and less expensive solution can be made up as follows: To every gallon of warm water add four pounds of commercial calcium of chloride (the chemical formula being $Ca\ Cl_2$). It should be thoroughly stirred while mixing. Care must be taken that chloride of lime ($Ca\ O\ Cl_2$) is not obtained by mistake, as this has, of course a very deleterious effect on metals.

It has been proved by careful experiment that a solution of calcium of chloride has no bad effect on either the metal of the cylinders or of the tank, except in the case of tanks made of galvanized iron or zinc, so for cars fitted in this way it is better to use the glycerine solution.

Club Formed in Pittsburg.

Pittsburg autoists to the number of more than one hundred met last week and formed the Automobile Club of Pittsburg. Great enthusiasm prevailed, and the large number of charter members is indicative of the great progress the pastime has made in the Smoky City.

The organization meeting was held at the Hotel Dorset, with George H. Flinn in the chair. Little time was lost in clinching the suggestions of the committee on permanent organization, the members of which were Robert Pitcairn, jr., Robert King and Linford Smith. The following officers were elected:

President, George H. Flinn; first vice-president, J. F. Burke; second vice-president, W. C. Temple; third vice-president, D. H. Hostetter; secretary, Thomas B. Hartley; treasurer, Reuben Miller, jr.; the board of governors, Class I, their term expiring in one year, are Reade W. Bailey, W. L. Elkins and Dr. J. A. Hawkins; Class II, with term of two years, includes A. R. Neeb, Dr. H. W. Urling and George Hailman; Class III, term of three years, is composed of E. B. Byers, W. Linford Smith and B. W. Lewis.

Jarrott Will Challenge.

Whether Winton defeats Fournier or the fortunes of war are the other way, the winner will have his hands full if he wishes to accept the challenges that will be showered upon him. In addition to the American challenges already announced, Charles Jarrott, the Englishman who won the Ardennes race last year, has announced that he will shy his castor into the ring as soon as the contests are decided, and ask for a race with the winner.

Protection From the Elements.

The question of how best to protect the occupants of a car from the elements has received little attention from the manufacturers, who may perhaps excusably plead that they have been employed in more important work. Coachmakers, too, from whom something might have been expected, have been unable to divorce luxury from weight. Hence it is that many attempts at solution have been due to the ingenuity of private owners.

The mere addition of a brougham body to a car produces, as a rule, an intolerable horseless effect, and even worse is the adaptation of a hansom cab top—about as inappropriate a combination as could well be imagined. The solution is not so difficult if passengers alone are to be protected, leaving the driver exposed; but as most owners drive themselves, the real problem is to satisfactorily cover the front seats. The chief desiderata are: First a hood, capable of being half raised (to protect the back of the head in dusty weather, a point much appreciated by women), and, when raised, to be able to carry an open canopy as well as an entire covering (both being held on the lightest possible framework), and a front glass.

Here another point comes in—it must be of such a form as not to be easily obscured by snow and rain, and not too far from the driver's face. It has been suggested that a V shaped glazed frame, forming a "prow," would be far less liable to obscuration than a flat front glass, and could be more firmly attached. And if glass could be replaced by some lighter and less fragile substitute it would be all the better. Celluloid would probably be unsafe, but the non-inflammable material used in some substitutes for goggles, possibly an insoluble gelatine, would be just the thing. It would need, however, to be very cheap and easily replaced, as the surface would not be very durable.

About Steel Frames.

"The chassis embouti, or pressed steel frame, may be lighter, stronger and ultimately cheaper than the old form of frame construction. From the point of view of the manufacturer, the question then arises whether the time has come for the standardization of frames, in view of the fact that so many purchasers of cars wish to have widely differing varieties of bodies unsuitable for a single standard of frame. At any rate, for the present, standardization, like the alleged economy, is out of sight. From the point of view of the owner, there is the question of the sequel to accidents. Will the frame resist the fancy manœuvres of an inexperienced user? Neither type of frame will withstand such abuse, but while the broken portion of a built up frame can be repaired, the pressed steel frame has to be replaced as a complete whole. This replacement means the complete dissembling and subsequent reassembling of the car," says a well posted autoist.

Police Commissioners "Hit it up."

Thirty miles in two hours, and one stretch of three miles in the alleged time of four minutes, such was the way Police Commissioner Greene trampled on the speed law in Brooklyn Borough on Saturday last. In his "big French" automobile, he dashed from one police station to another on a tour of inspection. The eight mile an hour injunction was handled ruthlessly, especially in the outlying suburbs, such as Fort Hamilton, Bath Beach and Coney Island, and when he got through it was little more than a name except for the ordinary everyday automobilist, who oversteps the limit at his peril. Strange to say, the Commissioner, who was accompanied by Deputy Commissioner Ebstein, was not molested by any of the vigilant officers encountered.

The stretches covered at the highest rate of speed were the Fort Hamilton Road and the Shore Road to Bath Beach, both of which are smooth, level and speed conducive. On them the automobile was "let out" and the inspection party proceeded at ful speed.

Rhode Islanders Eat and Elect.

In connection with the annual meeting of the Rhode Island Automobile Club, held at the Crown Hotel, Providence, R. I., last week, the club's second banquet took place and proved highly successful. President J. A. Chase of the club acted as toastmaster.

Officers to serve for the ensuing year were elected, as follows: President, Dr. Julian A. Chase; first vice-president, James E. Blake; treasurer, R. Lincoln Lippitt; secretary, Herbert H. Rice; assistant secretary, Benjamin B. Clark; board of officers, to serve until 1905, H. Anthony Dyer; to serve until 1906, Lowell Emerson and R. Lincoln Lippitt.

Secretary Rice's report showed the club to have a membership of 100, and eighty carriages owned. A brief review was made of the runs and smokers held by the club during the last year.

Treasurer Lippitt's statement showed the club to be in an excellent financial condition.

Good Roads at Chicago.

The committee in charge of the Good Roads Convention, which is to be held in Chicago on February 20 by the N. A. A. M., in conjunction with the Western show, has decided to issue invitations not only to those prominently identified with the good roads movement, but also to all the United States Senators and Representatives. The convention has received the sanction of the National Highway Commission, the National Good Roads Association and W. P. Brownlow, author of the $20,000,000 good roads bill now before Congress.

The board of governors of the National Highway Commission is made up of John Brisben Walker, Colonel A. A. Pope, General Roy Stone and John Jacob Astor. Colonel W. H. Moore, of St. Louis, is president of the National Goods Roads Association.

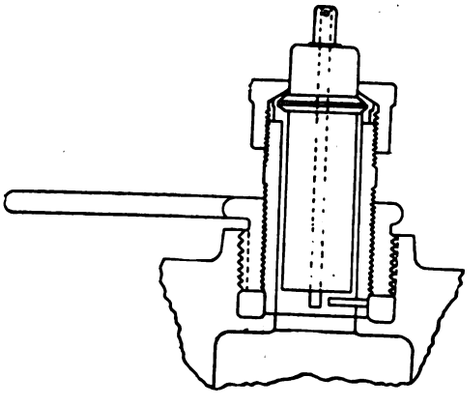
FIFTY STROKES AND BORES

Summary of Motor Dimensions Giving Varying Horsepowers and an Interesting Average.

An interesting subject, and one much discussed in the aisles and booths of the Garden during the show, was the sizes of motors and their horsepower. Some of the low priced tonneau cars, with small horizontal motors, were ticketed with big horsepowers, and on some of the big cars having vertical motors only a comparatively low horsepower was announced.

The annexed tabulated statement of fifty (50) separate makes of cylinder-fired, gasolene motors, or complete cars, taken at the show, reveals a wide divergence in the horsepowers claimed. This is, it is fair to assume, largely due to the variations in revolutions per minute, and to the varying amount of compression, assuming the mixture to be the same in all cases and the close fit of the cylinders and piston rings. It is of course perfectly obvious to those familiar with the art that a multiple cylinder motor with a light flywheel having an almost constant tongue, must show a greater percentage of power per square inch of piston area than a single cylinder motor carrying a heavy flywheel to give it momentum during three-quarters of the operation, the motor only working one-quarter of the time.



The comparisons are, nevertheless, of interest and value, and as an item of curiosity a composite motor made up from the figures develops a motor of 12 horsepower with 5 inch bore and 5 inch stroke and two cylinders:

Name.	Bore.	Str'ke	H. P.	Cyl'dr

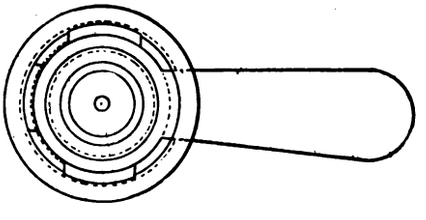
It is worthy of remark that some of those attending booths were ignorant of the stroke and bore of their motors, while a smaller number declined to give the information.



Making Valves and Plugs Accessible.

One of the most commented on features in the Madison Square Garden show were the hand removable valves and spark plugs of the Columbia gasolene cars. Accessibility could be carried no further than has been done with them. No wrench or tool of any kind is needed to enable the operator to take out either of the valves or any of the

spark plugs, examine, clean and return them. It is all done in an instant, and no one who has labored over the regulation plug and valves can fail to appreciate the improvement that has been made. The illustration shows the construction of the spark plug, which is operated in this manner:

Holding the plug in the hand with the wrench arm in a vertical position, insert the threaded end of the plug into the hole in the cylinder provided to receive it, until the shoulder of the plug is fair against the shoulder in the cylinder. Then turn the wrench arm to the right (which will engage

the threads of the spark plug with those in the cylinder casting), continuing the motion of the wrench arm to the right until the spark plug is as tight as it would be screwed up in case an ordinary thread was used. The idea of the plug is to provide a thread which is exactly the same as would be the case if a continuous thread was used. The idea of cutting away the thread on the plug and in the cylinder is to simply provide a means by which the spark plug may be inserted until the shoulders engage by a forward motion of the hand and tighten in place by a rotary motion, which, in any case, will not exceed 50 or 55 degrees.

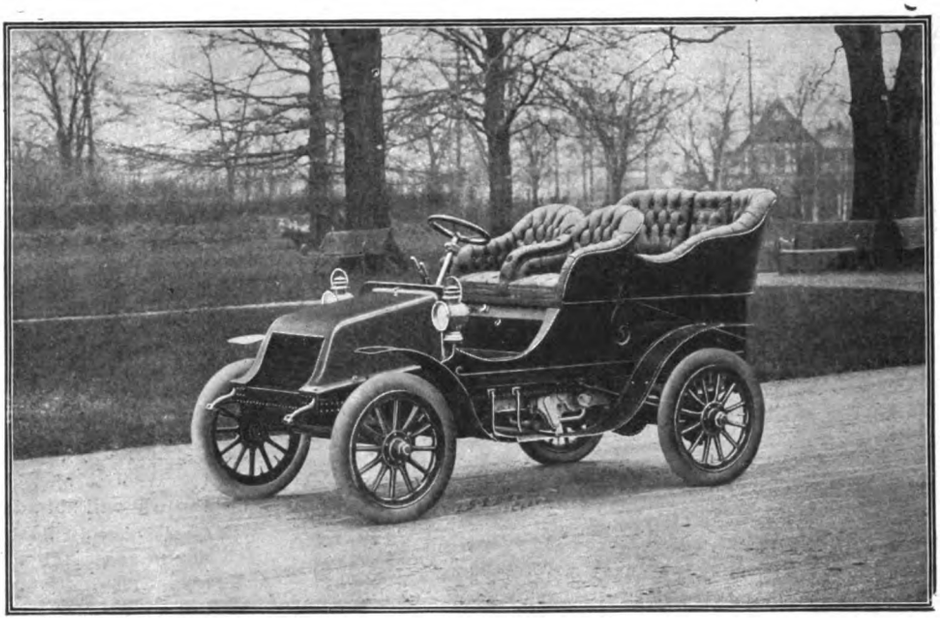
FLOUTS MECHANICAL VALVES

Here's an American Maker who Stands for Automatic Intakes—French Going too Far?

Mechanically operated intake valves have their detractors as well as advocates. The former assert that they are neither new nor good. Their advantages are admitted, but drawbacks are pointed out and claimed to more than counterbalance the former. A well posted tradesman, writing to the Motor World, makes the following points against them:

"Generally where the sheep leads the herd will follow, so I suppose it is useless to try to stem the tide in favor of mechanically operated inlet valves. It would be a poor device that did not have some advantages, but more certain running at slow speed is certainly not one of them. To control the motor the charge is throttled lower and lower until the desired speed is reached, and if the throttle will not admit the charge no amount of opening an inlet valve will do so, so the advantages stated by you are unquestionably imaginary ones; but, since fashion knows no law except its own sweet will, they are probably as good as scientific reasons.

"As a matter of fact, motors run with automatic valves much higher than is good mechanical practice, and the automatic valve opens and closes more accurately at all speeds than any mechanically operated valve can possibly do. For all ordinary service, therefore, it is unquestionably better, but for the highest possible speed, such as in a racing machine, it is possible to make the mechanical valve do the best work, and this accounts for its adoption by some people. For those to whom the automobile is a racing toy, the mechanically operated valve should appeal, but to practical people wishing a carriage for every day use it should possess no beauty.



"However, farmers buy Norman draught horses for their own use and raise trotters to take prizes at the county fairs. Bicycle makers built racing machines for their models, and sold them to people to use on the road. They had such small tires, stiff frames, harsh pedals and high gear that there was no fun in riding. Automobile makers in France followed the racing game until a restriction became necessary, which was placed by limiting the weight. They are succeeding in spite of this limitation in going far beyond the practical, and good sense will unquestionably demand a further limitation in the near future."

New Firm in Boston.

Boston's newest retail automobile firm is Drisko, Snow & Ross, incorporated, No. 43 Columbus avenue. They have become New England agents for the American and Reber cars, made by the American Motor Carriage Co., Cleveland, Ohio, and the Reber Mfg. Co., Reading, Pa., respectively.

$2,500

WILL YOU

pay two thousand, five hundred dollars for a genuinely good automobile which represents the present highest standard of excellence in design and manufacture?

If you do not appreciate the vital difference between superficial perfection and construction that is honestly good and thoroughly scientific from wrist-pins clear out to the last coat of finishing varnish, then you will not be especially attracted by the new twenty horse-power

WINTON TOURING CAR

We hope, however, that you will recognize our latest successful efforts and accord this new model the consideration it deserves. You who have been conscious of the rapid development of the successful American automobile, who have watched it through its various stages since the time—years ago—when Mr. Alexander Winton ran upon the roads his first "horseless carriage," will recognize the great strides we have made toward the goal of perfection in automobile building, and can appreciate in no small sense the genuine pride we feel in this latest triumph.

It is not intended as a "sensation." It does not incorporate a vast number of rare features for which we, in justice, can claim no more than theoretical excellence. Its construction does not embody a vast number of untried experiments, and we do not, therefore, ask anyone to share in a manufacturer's gamble. In presenting this model we give the very essence of practical and thoroughly tried out experience.

Consider the matter of delivery: During the current season we will be able to manufacture just one thousand of these twenty horse-power Winton Touring Cars. A liberal percentage of the total output has already been sold. Supply will not meet the demand, of this we are quite sure. Would it, therefore, not be an act of wisdom to file your order early and allow some one else to be disappointed as the result of procrastination?

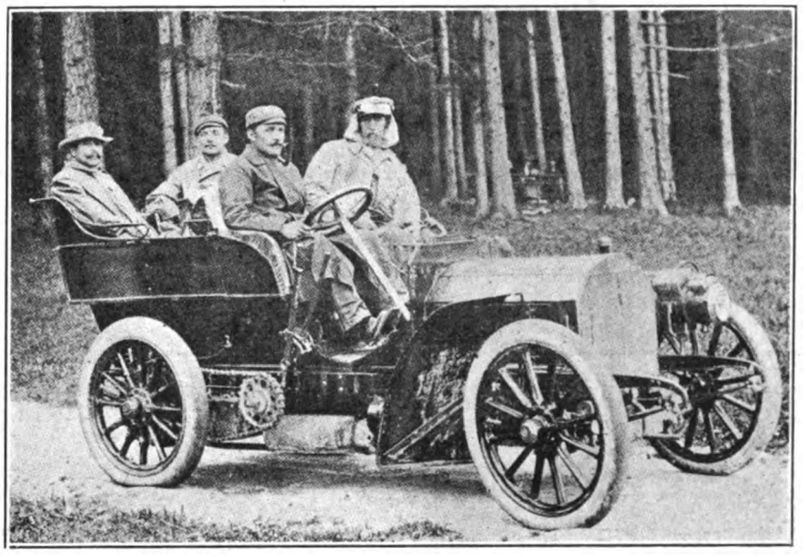
HORIZONTAL VS. VERTICAL

Some Stern Truths Regarding the Much Discussed Subject of Motor Position.

"There is a tendency in some quarters to speak as though the horizontal engine for motor cars was a thing of the past, and that anybody using such an engine was hopelessly out of date. Others in discussing the question recognize the fact that it is largely one of fashion which has brought the vertical engine into such prominence; but very few recollect that the very fact of the predominance of the vertical engine has resulted, with a few exceptions, in the great proportion of the latest improvements being embodied in it instead of in horizontal engines, as many of the makers of the latter type have, when redesigning their patterns, decided to follow the stream and to make vertical engines," says the Autocar.

"Consequently all their improvements have been embodied in the upright pattern, and the new car has been a great advance on the old one. This has been attributed to the position of the engine instead of to the higher power and numerous detail improvements which might just as well have been introduced into a horizontal motor had the makers deemed it advisable. Besides this, the transmission—in fact, every part of the car—is improved, but often the vertical engine gets all the credit.



"It should be clearly understood at the moment that we are not proposing to discuss the merits of the two types, but merely to point out that the present wide use of the vertical engine is due to a very general following of certain prominent makers rather than to any special virtues possessed by it and not equally enjoyed by the horizontal type, as the two objections which are nearly always raised against the horizontal motor do not hold good if the engine is properly designed. We mean to say the majority of those who condemn the type assert that it is inaccessible, and that there is difficulty with the lubrication. These are objections which need not weigh for an instant, as there is no good reason why a horizontal engine should be inaccessible, and lubrication certainly gives no trouble with a properly designed engine, whether it is horizontal or in any other position.

"As this is the case, we take this opportunity of recording our opinion that the horizontal engine is a very long way from falling out of use for automobile propulsion. In fact, at the present time we know of a new and very promising type of vehicle which is being designed with a horizontal enegine, and that by a very experienced engineer who has designed more than one of the most successful vertical engines in use. We believe that there is room for both patterns, and that the predominance of one or the other will be largely a matter of fashion at the moment, although, of course, it will depend on developments and improvements which may be more applicable to one pattern or the other.

"Again, suppose a year or two hence the Gordon-Bennett and one or two other important races were to be won by cars fitted with horizontal engines, many who now condemn the type would be surprised to find how many hidden virtues there were in the horizontal engine after all."

America's Cup Delegate Abroad.

One of the keenest automobilists to be found anywhere is Clarence Grey Dinsmore, who has just been selected by the Automobile Club of America to represent it in Paris in connection with the Bennett Cup race. Being an American permanently residing in Paris, he is particularly well fitted for the post.

It will be recalled that last summer Mr. Dinsmore bore off the honors in what is known as the Semmering run in Austria. He also won the Austrian Automobile Challenge Cup last fall, awarded for the fastest time made in all classes. Mr. Dinsmore uses a 40 horsepower Mercedes car, and the illustration depicts him in this, with Robert Katzenstein, a Frankfort banker, in the tonneau. The chauffeur, Werner, who in 1901 won the race from Nice to Salon and return, occupies the front seat with the owner of the car.

That Sweet-Scented Marquis.

If reports be true, the Marquis of Anglesea is a most picturesque peer. The story current a little time ago, viz., that he used scented gasolene in his automobile, appears to be the truth, but not the whole truth. It is now stated, with the gravity that is meet, that when Lord Anglesea drives the scent distributing car he has his hair tied up with ribbon to match the particular scent distributed on the day—violet, rose or primrose, as the case may be.

AUTOMOBILIST GETS DAMAGES

Sues a Connecticut City for Accident due to Bad Streets and Wins—Court's Comment.

An important ruling fixing the responsibility for accidents arising from imperfect streets was made by Judge Roraback in the Superior Court at New Haven, Conn., last week. Damages in the sum of $400 were awarded George Lavigne, who had brought suit against the city.

It appears that while he was running an automobile at the corner of Howe and Chapel streets, it was swerved from its course by reason of a hole in the pavement between the trolley tracks, and struck a tree. Lavigne was thrown out and injured. The hole in question was four feet long, seven inches wide and four inches deep.

Judge Roraback found that, while under a State law the railroad is responsible for the condition of the pavement between and near to its rails, the statutes do not release the city from the statutory liability to the traveller, but simply make the railway company also liable to him, or answerable to the city when compelled to pay. The municipality is primarily liable, although an injured party may proceed against it or the railway corporation.

For Mail Service in Switzerland.

Along with its excellent roads, Switzerland has many exceedingly steep gradients, up which horse drawn vehicles are taken with difficulty.

The ubiquitous automobile, however, promises to change all this. The mountain republic is destined to become, it is asserted, the land of automobiles. In three years it is expected that every horse connected with the coaching and mail services will have disappeared. In the coming spring the first steps will be taken in bringing about this great change.

Motor Wagons in Indianapolis.

How much of it is due to the fact that Indianapolis has a number of automobile manufacturing concerns is not easy to say, but certainly the Hoosier city is partial to the mechanically propelled vehicle. Furthermore their use is said to be extending very rapidly.

Although there are many vehicles used solely for pleasure, it is the utilitarian aspect of the matter that is attracting the greatest attention. Physicians have a decided partiality for the electric carriage, it being estimated that nearly 50 per cent of those used are in the service of medical men. Dr. Henry Jameson was the first to adopt the automobile, more than two years ago. He grew enthusiastic at once. Since then many men of his profession have followed his example.

Around the Newton Claypool Building, where "Doctors' Row" has been transferred, there is a string of automobiles at all hours of the day.

At the present time, however, it is the delivery wagon that is attracting the most attention. Merchants have not been slow to take advantage of the delivery facilities offered by the automobile. The New York store, Ayres's, Rink's, Deschler's cigar store, Coffy, the tea merchant; Flauner & Buchanan, undertakers; the Indianapolis Dress Pleating Co., Merritt's woollen mills and many others all use motor driven delivery wagons now.

Several of them are considering increasing their automobile service, and it is probable that many new wagons bearing some of the same names will appear on the streets within a short time.

"Almost to a man the merchants that have used automobiles for their delivery wagons would never think of returning to horses," a local tradesman is quoted as saying. "Those that still use horses are thinking of relegating them to the barn and using autos altogether. Automobiles are more economical in the long run—they are surer, quicker and more advantageous in many ways."

The concern that uses more automobiles than any other in Indianapolis is the Frank Bird Transfer Co. It is now running eight hansom cabs, two broughams are in Chicago awaiting orders to be delivered, and the company is considering the advisability of doing away with its horse coach service altogether.

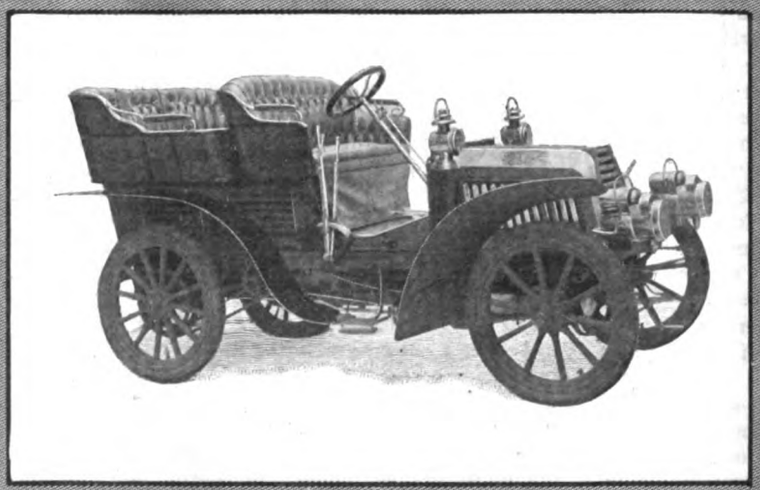
Palmer a Sweet President.

A lively row broke out in the Chicago Automobile Club when its president, Honore Palmer, alderman and society leader, introduced an ordinance before the city fathers requiring all automobiles to carry white numbers four inches high on a black background, under a penalty of a fine of from $5 to $25. The club bitterly opposed the ordinance, and Alderman Palmer sent in his resignation as president of the club, which was promptly accepted.

Something About the German Cup-Lifters.

In a talk on the coming season's racing, the terrific speeds that will be seen were touched on by Baron Henri de Rothschild, the famous French autoist.

He had been shown the new 40 horsepower vehicle in course of construction by M. Serpollet, which had been tried, and which had travelled at a speed of ninety-two miles an hour. On the Promenade des Anglais at Nice M. Serpollet hoped to achieve a rate of progress equal to one hundred miles an hour.



With regard to vehicles propelled by combustion engines, he had just returned from Stuttgart, where he had been shown the new engines constructed for the Gordon Bennett cars. They were of 100 horsepower, and would be fitted to vehicles which would be very terrible instruments to look at. The cars would be over ten feet long, the driver would sit above and in rear of the back axle, and the inclination of the steering pillar was such that the steering wheel was quite vertical.

These vehicles were expected to travel at a speed of one hundred miles an hour; but he had discussed the question of the conduct of a fast car at speed with his friend the Chevalier René de Knyff—the finest and most courageous driver in the world—and it was his opinion that the limit of human control was reached, or very nearly reached, at a speed of ninety-eight miles an hour.

THE BERG CHASSIS

8 And 15 H. P.

Under reigning conditions in this country, no matter how much money may be spent for a vehicle, it is invariably known as the product of the factory rather than the property of the owner.

As a remedy we propose that customers confine their dealings with us to the purchase of the chassis, and consult with expert carriage makers concerning body design, upholstery, furnishings, etc.

Our pattern book enables customers to choose from hundreds of original body designs, amazing to those who fancy that in the vehicles seen to-day the possibilities of design are exhausted.

OIL-DEFYING SPARK PLUGS

Electrical Eccentricity That Serves Many Good Ends—How it may be Employed.

For about a year past the workmen whose duty it is to test the engines in the Panhard & Levassor works have been in the habit of arranging the high tension wires which are usually attached to the ends of the sparking plugs in such a way as to set the end of the wire about one or two millimetres from, but not attached to, the outer end of the conductor wire of the plug. The men found that this arrangement afforded them two advantages. In the first place, they are able to see if the current is passing properly to the plug; and, in the second, they benefit by the interesting and hitherto unexplained fact that when the current passes to the plug, as already explained, the spark jumps the interval between the platinum points within the cylinder, however much the same may be covered with oil. As new motors under test are, for obvious reasons, very liberally lubricated, this strange freak on the part of the electric current saves the testers much delay and annoyance.

It was quite by chance that the above little electric eccentricity was discovered. Messrs. Panhard and Levassor conceived the idea of protecting the exposed ends of sparking plugs by an ebonite cap A (fig. 1). In the under dome of the cap was fitted a metallic boss B, the cap itself being attached to the sparking plug as shown. A light copper spring connected the boss B with the end of the plug for the conduct of the current. One day, upon taking off one of these ebonite caps it was found that the copper spring conductor was absent between C and D, but, notwithstanding the cylinder to which the apparently faulty plug was fitted, fired perfectly. This was not particularly remarked at the time, as the spark given off by the coil at atmospheric pressure was something like fifteen millimetres in length, and the distance it was required to leap by the absence of the conducting spring was not more than three millimetres. But what did astonish was the fact that no matter how much the particular sparking plug served by this apparently faulty connection was drowned in oil, it sparked as well as if not better, than ever.

In "La Locomotion" M. Baudry de Saunier relates how this curious feature was demonstrated to him at the time by a complete connection being made to the oil soaked plug, when it altogether failed to spark, but recommenced to do so merrily when the connection was again interrupted in the manner that is indicated, and the spark obliged to jump once more within the ebonite cap.

We leave, says M. Baudry de Saunier, the explanation of this phenomenon to the profound electricians, and he goes on to show his readers how they may adapt their plugs to permit of the oil defying jumping spark. Reference to figure 2 will demonstrate this; E is a shaped collar made in ebonite, or better in some substance which is at one and the same time a non-conductor of both heat and electricity. This collar is screwed on to the plug as shown. It carries on its little projecting arms a small copper angle piece drilled and tapped for the attachment by a screw C and lock nuts of the secondary wire. The end of the screw is made to approach the end of the plug wire within one or two millimetres. To arrive at the sparking points on the cylinder end of the plug the current is obliged to leap the little gap of one or two millimetres which exists between C and D. This mounting of the plug, says M. de Saunier in conclusion, not only increases the power of the engine, but, as has already been stated, causes the plug to spark properly within malgré any amount of overlubrication of the cylinder.

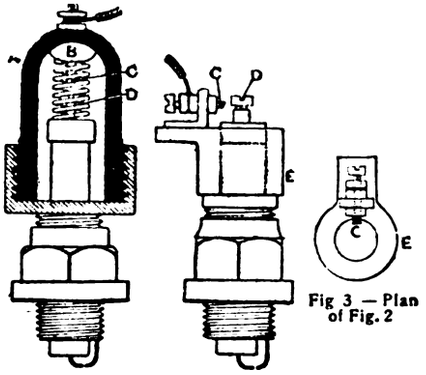

Fig. 1. Fig. 2

Fig 3 — Plan of Fig. 2

Excursion Rates to the Chicago Show

An advantage which has not been heretofore enjoyed by exhibitors from Eastern States in connection with the automobile show, which opens in Chicago on February 14, is the opportunity of securing a special rate on the certificate plan from all Eastern points.

In connection with the show the Boston & Albany, New York Central & Hudson River and the Michigan Central railroads will sell excursion tickets commencing February 11 for continuous passage to Chicago. When purchasing tickets ask for a certificate to the "Good Roads Convention" and "Automobile Show" via Michigan Central, and pay full fare going. The certificate will return you to the starting point for one-third the regular rate.

Trains for Chicago leave Boston at 2 p. m., 4.15 p. m. and 6 p. m.; New York at 8.45 a. m., 1 p. m., 4 p. m., 6 p. m. and 12.10 a. m. Sleeping car reservation can be secured by addressing the passenger agent of any of the above lines.

DATES CENTURIES BACK

Discovery of Petroleum Untraceable—What it is and how its By-Products are Obtained.

Petroleum was known in very remote ages, centuries before the Christian era, in fact. The Greek historian Herodotus speaks of it, as do the later Plutarch and the Roman Pliny.

Plutarch calls it naphtha, and the wonderful fires at Baku, which were merely ignited gas or oil fountains, were worshipped as things supernatural. Another famous historian—Marco Polo—mentions it in his book, and speaks of it rather as a medicine for camels afflicted with skin diseases than as a combustible material.

Various references can be found in later but still ancient works, which form satisfactory evidence that petroleum was well known many centuries before it became at all largely used. It was a thing to wonder at even as late as the middle of the eighteenth century. To-day the supply is enormous and the wells appear almost inexhaustible.

As it proceeds from the well crude petroleum consists of a mixture of gases, easily volatile liquids, heavier liquids such as ordinary paraffin, and, dissolved in this mixture, solid material like paraffin wax. All these substances are chemically related to one another, and are made up of the elements carbon and hydrogen. The difference between the gaseous portion of crude petroleum and the liquid or solid portions is simply that in the molecules or smallest possible portion of the substance, the gas will have a comparatively small number of atoms joined together, and the liquid and solid portions will have considerably more.

It has been long agreed that crude petroleum is a mixture of what is known as the paraffin series of hydrocarbons. The number of carbon and hydrogen atoms varies in the different substances, but it is a recognized fact that in all the members of the paraffin series there are twice as many plus two hydrogen atoms as there are of carbon. To make it clearer, if there be twenty carbon atoms, there are forty-two hydrogen atoms. For instance, in the very simplest constituent of petroleum—marsh gas—there is one atom of carbon and four atoms of hydrogen. Some of the solid portions of crude petroleum may contain in the molecule up to seventy atoms of carbon and 142 of hydrogen.

The chemical properties of the various petroleum products, of which "motor spirit" is one, are very similar. Their behavior under certain conditions is practically the same, except that they boil at different temperatures, the boiling point rising with the increase in the number of carbon atoms in the molecule.

The various products of crude petroleum are obtained by what is known as fractional distillation. If a certain oil be required for a particular purpose it is necessary to separate out from the crude petroleum just that portion which will exactly fulfil the conditions required. The crude petroleum is taken and, after a certain preliminary treatment, is distilled. The low boiling portions of the liquid are given off first, and so on until the heavier oils are reached and paraffin wax is left in the retort. The particular oil required is given off at a certain period in the course of distillation, and can be secured and so separated from the other products. To obtain a purer article still, this separated oil is distilled again, and it is partly to this fact that motorists must look for the reason why "motor spirit" is expensive in comparison with other crude petroleum products such as common benzolene. It is essential for motor purposes that the oil should have the correct specific gravity, and that it should evaporate at the right temperature and leave no residue.

The problem of the origin of crude petroleum is a most interesting one, and still awaits conclusive solution. One school of scientific thought holds that petroleum is the result of contact in the interior of the earth between water and molten metallic carbides. The water is supposed to percolate through the earth till it reaches the molten carbides, and to be formed into petroleum as the result of the reaction. This resembles the method by which acetylene gas is manufactured from calcium carbide with water. Another school of chemists holds that petroleum is the result of the decomposition of organic material. The fact that petroleum is found in almost all geological formations favors this theory, but this school of thought is divided against itself upon the question as to whether the organic material from which petroleum is said to be derived is of marine animal origin or of vegetable origin.

Whichever of these theories is correct, the conditions favorable for the natural storing of the oil seem to be the same whatever the quality and general surroundings. The oil is absorbed by porous rock which is protected by a covering of hard rock from oxidization and displacement by water. The cause of a "gush" of oil is variously explained. The weight of overlying strata is sometimes said to force the oil up through the well, or this may be effected by the pressure of accumulated gases or by water pressure. The pressure in either case must be enormous. The oil is sometimes flung to a tremendous height, and the pressure is maintained for a lengthened period. A recent "gusher" in Texas, for instance, was said to have a capacity of 200,000 gallons of oil a day, and a still greater stream is recorded of two of the Baku fountains, which each flung into the air with tremendous force nearly 30,000,000 gallons of oil in a month. It is needless to enlarge upon such facts as these to show the extent of the pressure which is exerted from some cause around the petroleum deposit.

As a source of energy petroleum would appear to have a great future before it, and yet it is not certain that the supply of petroleum is inexhaustible. The contingency of the supply failing must always be reckoned with. Especially is this the case as the origin of petroleum is an unsettled point; and consequently it is uncertain as to whether the supply of petroleum is or is not being continually replenished. Even a reduction in the amount of the present generous supply would make a difference in the price, and so affect the position of petroleum in the competition with other sources of energy such as coal and the power of wind and water. But apart from such a catastrophe it is safe to say that petroleum will always play a large part in the supply of mechanical energy for the world. It has many advantages over coal. It is readily portable, comparatively clean, efficient, and in many cases more economical; and if it should one day become rare, motorists will be able to fall back on alcohol as fuel for their engines, or—and this is perhaps more within the horizon of the probable—alcohol may supersede gasolene.

The "Joys" of Being Towed Home.

Can you imagine anything more woebegone than the appearance of an outfit that has become en panne, as the French say—that is, broken down, and has to be towed home? There is a dogged, resentful, look on the chauffeur's face, and a mournful, pathetic air about the vehicle that almost compels sympathy. In the interval of waiting for the rescuing vehicle a crowd gathers and asks a hundred and one questions more or less pointed. They range from dissertations on automobiling as a development of present day civilization to the merits and demerits of automobiles in general, and descend by natural graduations to the recalcitrant automobile in question. From speculation upon causes of trouble, they pass to direct questions as to what ails this particular car, and guesses as to when it will start up again.

When the welcome relieving car heaves in sight, and a stout rope is made fast to the convoy, the excitement increases and culminates when the two cars get slowly under way.

As they pick their way cautiously through crowded streets the contrast between the two operators is a singular one. The face of the first wears a smirk, and he seems to chuckle inwardly, although not too openly, seemingly mindful of his own liability to meet with such a mishap. The unfortunate chauffeur, however, attends strictly to business, guiding his car with circumspection and striving to keep the rope always tight. Should the other car have to slacken speed the brakes would be applied to the second to check its impetus also, and released in ample time to prevent its being started with a jerk.

When the garage is reached there is no gladder man than the chauffeur of the disabled car. Some of the blame for its going wrong seems to attach to him, and he feels it keenly, even when it is not his fault.

MAYOR WON'T SIGN

Trenton's Executive Vetoes an Anti-Automobile Ordinance and Give his Reasons.

In returning without his approval an automobile ordinance passed by the Trenton (N. J.) Common Council, Mayor Katzenbach commented on the unsatisfactory character of the present wheeled vehicle law of the State.

"On April 9, 1902, there was approved an act entitled 'An act to regulate the use of wagons, carriages and similar vehicles, and to require uniformity of ordinances affecting the same,' which was designed to give authority to cities and other municipalities to regulate the use of automobiles, although the word 'automobile' does not appear in the act. This act was modelled after an act passed in the year 1896 (P. L. 1896, p. 21) to regulate the use of bicycles, but, unfortunately, does not deal with the subject of regulating the use of automobiles as fully as the act of 1896 did with the use of bicycles. Indeed, the act of 1902 leaves much to be desired and omits many matters which would seem essential to the proper regulation of the use of automobiles." He said:

"However, it is clear that it is the intention of this act of 1902 to secure uniformity in ordinances of the character of the one you have passed, and, therefore, so far as the act of 1902 goes, your ordinance will have to conform to its provisions in order to be valid."

He goes on to point out wherein the ordinance is inconsistent with this law:

"Since there is no provision in the act of 1902 regarding the speed limit, and there is no express power conferred by the charter to deal with this subject, the inquiry is naturally suggested as to whether this subject can be regulated by ordinance, or, if regulated, so dealt with as to make a speed regulation which will affect automobiles only and not the rate of speed of carriages and other vehicles using the public highways. I leave these questions for your future consideration," he concludes.

It is probable that the incoming legislature will be asked to pass a bill regulating automobile traffic.

Tale of Two Philadelphians.

The following story is told by two automobilists who were driving from New York to Philadelphia. In a town near Philadelphia they were stopped by a police officer and charged with the customary crime. They offered to drive him to the police station, where their names might be taken and the charge be formally made. When he was on board they set off at high speed to a road house near Philadelphia, and did not afford him a chance of dismounting in the mean time.

He was somewhat confused by the unaccustomed speed, and on his arrival at the inn was invited to partake of an excellent dinner and overwhelmed with other attentions, which had the effect of still further confusing him. He was then driven back to his home town at a pace which his official capacity hardly approved, but which seemed to complete the psychological revolution begun by the first journey and continued by the festivities in which he took part at its close. Either Philadelphia scrapple or the rapid movement through the air removed all traces of the offence from the policeman's mind. Perhaps he was too much of a sportsman, or perhaps he was to some extent a consenting party, a thing that has been known to occur in other instances of abduction. In any case, nothing has been heard of the affair.

Modifying New Jersey's Measure.

Material modifications are likely to be made in the Scovel bill regulating automobile traffic, introduced in the New Jersey legislature last week, as exclusively noted in the Motor World.

Its introducer, Assemblyman Scovel, of Camden, appears to realize the imperfections of his measure. He said on Monday that he would modify his bill regulating the use of automobiles in the State so that it would not work any serious hardships on the automobilists.

The proposition to have a State board of examiners will be eliminated, he says, and the licenses to automobilists will be issued by the State Controller upon the applicant answering certain questions under oath. These questions will relate to the experience of the applicant. Upon taking out a license the automobilist will receive a number, which will be registered by the Controller.

In its original form the bill provided for a maximum speed of fifteen miles an hour, and for the institution of a State board of examiners, before which all automobilists must appear and apply for a license before being permitted to operate their cars. The disposition to concede something to the users of these cars is gratifying, but unless the bill is shorn of more obnoxious features than is indicated by the remarks of Assemblyman Scovel it will still be vigorously opposed.

Vanderbilt's Alibi.

Having disconcerted the prosecution by putting in an alibi, counsel for W. K. Vanderbilt, jr., succeeded in having postponed his client's trial for "scorching," which came up this week at Paris. The alleged offence was committed last summer, when the millionaire-autoist was in this country. Nevertheless, he was sentenced in default. He took an appeal, and on the hearing his counsel stated that Mr. Vanderbilt never drove an automobile himself, and in this instance he was not even in the vehicle. This contention was supported by an affidavit by the Duke of Marlborough, and the judge postponed further hearing of the case to February 13 for further testimony.

COCKS BOBS UP

He Inspires Long Island Farmers' Club to Define Their Ideas of Automobile Legislation.

Farmers and—well, the others who are members of the Long Island Farmers' Club—have wrestled with the question of having some new legislation at Albany to further restrict the use of the automobile, and after wrestling with it have turned the whole matter over to former State Senator Cocks, the father of the notorious Cocks law. Mr. Cocks was recently defeated at the polls, but according to the news from Mineola, L. I., where the Farmers' Club met recently, he is still hunting for automobilists' scalps.

The discussion resulted in the adoption of a resolution referring the whole subject to the wisdom and discretion of ex-Senator Cocks, with the views of the club as to what should be done embodied as follows:

"That the present law regulating the speed at which automobiles may be driven be not disturbed, but that additional statutes be enacted providing that all operators of automobiles be required to obtain a license; that a failure to comply with that part of the automobile law—chapter 531, of the laws of 1901—referring to the equipment of the machine and stopping on signal be made a misdemeanor, punishable by a fine or imprisonment, or both, and that numbers be substituted for initials, and that they be placed on the lamps as well as on the machine, and be in plain figures."

Lovely place, Long Island! Salubrious! Several insane asylums and cemeteries there not doing half the business to which they are entitled.

Case Against Du Puy Dropped.

After having been held under bonds for nearly seven months Harry W. Du Puy, of Allegheny, Pa., a Yale student, has had the case against him dropped. He was held accountable for the death at New Haven of Dr. Thorpe Munro, a civil engineer, who was riding a bicycle on June 19, 1902, when he ran into an automobile operated by Du Puy. Munro died several days later of the injuries he received. Prosecutor Williams said that in his own opinion and that of the court a jury would not have found Du Puy criminally responsible in the matter, the circumstances of the accident being considered.

Orange of the Right Sort.

Citizens of Orange, Mass., have signed a petition drawn up for presentation to the Senator and Representative in the legislature, praying them to vote against legislation adverse to the automobile, on the ground that it would be in effect a blow at the town industry.

Evidently there is no desire on the part of the Orangeites that automobiles, and especially Grout automobiles, should be injuriously affected by adverse legislation.

EXPULSION OF THE EXHAUST

It and the Admission of Fresh Charges Depend Chiefly on Valve Efficiency.

The importance of as nearly as may be filling the cylinder and combustion chamber of an internal combustion motor with fresh explosive mixture of gas and air in proper proportions, and as nearly as may be completely emptying the space referred to of the products of combustion remaining from the previous discharge of power stroke, must be apparent to every student of motor design and construction.

A very small contamination or adulteration of the new charge of gas by the residue of the last charge may be of little moment, provided it be confined to this same very small adulteration, but actual experience tends to prove that any individual engine, as designed by its makers, will not for long continue to exhaust its originally designed proportions of the useless products of combustion, but will from various causes gradually deteriorate in this respect, and so lessen the quantity of fresh explosive mixture presented to the ignition spark, with consequent weakening of the explosion and the engine power.

It is, of course, impossible by the mere direct action of the piston to expel all the remains of the burnt or partially burnt gases from the cylinder, as under existing conditions there must remain always a certain body of foul gas equivalent to the space of the combustion chamber, and, further, this residue must in all or most cases be under some degree of compression, so that the entry of fresh explosive mixture does not commence (under the present method of piston suction) until such pressure has been relieved, by which time the piston may have performed nearly half its suction stroke, particularly if the exhaust valve, either from false setting or wear, or any other cause, is subject to the fatal fault of closing somewhat too early.

Supposing, however, that in the original design as commonly employed, the workmanship has been such as to secure a minimum amount of loss from this cause, it then devolves on the user of the motor to maintain something like the original order of things and so secure the maximum explosive effect of which the particular design admits.

To do this there are some three or four points to be watched; first in importance is the suction power of the piston and the ready opening of the inlet valve; next is the proper closing of the exhaust valve, and these two conditions can be maintained only by frequent and careful inspection of the inlet valve spring, and the amount and direction of wear in the exhaust valve and the cam mechanism operating it; but any fault in either direction may—as a rule—be roughly diagonzed by the falling away in the degree of compression exhibited by the motor on turning the starting handle; or, in the case of the motor cycle, on pushing the machine along the ground and noting the resistance.

Irregular strength of inlet valve springs and indifferent timing of exhaust valve opening and closing may be blamed for the majority of troubles incidental to poor compression and poor explosive force of the mixture, for if the inlet valve spring be weak it opens readily enough when the back pressure is relieved and the piston sucker takes effect, but is somwhat tardy in closing, with consequent loss of a portion of the charge; if, on the other hand, the inlet spring is too strong, the valve fails to open until late in the piston's stroke, and so the charge is diminished.

Add to either of the above conditions an exhaust valve which opens too soon and closes too soon, you have a set of circumstances which entirely precludes the engine or motor from doing its best work, because in this case the bad inlet valve influence with its resulting poor charge and poor compression is aggravated by a too early release on the exhaust in the first instance and a back pressure on the piston when completing the exhaust stroke.

If, on the other hand, the exhaust valve both opens and closes too late, then there is, as a first result, a certain amount of back pressure on the ascending piston or on the exhaust stroke, followed by a loss of new mixture due to the lack of suction action of the piston where the exhaust still remains open after the piston has turned the dead centre.

The mechanically operated inlet valve, which is at present being exploited as a novelty in automotor construction, but which in stationary gas engine work has been quite common for a number of years, is the first practical step toward the elimination of the faults referred to, but although the positively operated inlet valve would appear to be likely to become general, and indeed must become so, it is highly probable that future developments will continue further in the same direction by causing a fixed quantity of explosive mixture to be injected or forced into the cylinder at every charging stroke.

In the Diesel system the engine compression deals only with pure air, the quantity of necessary gas being injected afterward to form the desired explosive, but it is not in this direction that future advances are likely to take place; it is more likely that the requisite explosive mixture in proper proportions of gas and air will be formed as at present, outside of the engine proper, and such mixture will be pumped or otherwise assisted to forcibly pass through the open inlet valve, and so fill the cylinder and combustion chamber to a greater extent that is at present practicable with ordinary suction or mere atmospheric pressure valves.

The subject of increasing the efficiency of the modern motor by providing a more complete and more uniform charging rate in combination with a more thorough exhaust and relief of all back pressure, is one of the questions of to-day, the solving of which will do much to increase the somewhat poor efficiency now shown.

Tested in the Desert.

The following letter from Cairo, Egypt, to "The Brooklyn Daily Eagle" is interesting, but would have been much more so if the correspondent had told what sort of a motor was used, and had given some description of the wagon:

"The Egyptian Government, seconded by the British motorist enthusiasts on the Cairo staff, has successfully completed a series of experiments in desert travelling by motor. A desert motor wagon, conveying forty soldiers at Abbassieh, spun down the Suez 'Road,' negotiating the rough passage in fine style. On getting into the desert the real trial began.

"Where the sand was fairly firm, good running was made. The wagon was fitted with tires having broad flanges, which gripped well and drove the machine onward. Where the sand was loose the going was difficult, the wheel occasionally churning sand without progressing. This fault will be removed by the use of broader tires.

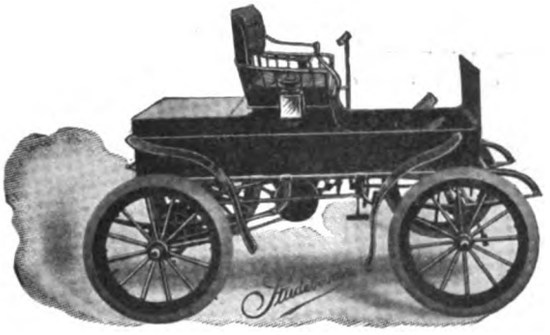
"Hill climbing experiments were made in Cairo, and a wagon carrying a freight equal to three tons covered the great citadel hill in fourteen minutes without a stop. The representatives of the ministry and the army were well satisfied with the general efficiency of the wagon for transporting troops. Trial was also made of a desert transport wagon for camel, horse, mule or motor traction."

Taking Care of the Valves.

The admission and exhaust valve should work freely, and need very little attention. Through too free oiling or too rich a mixture they may become clogged with soot, when the valve should be removed and washed in gasolene. The spring should be freed, and the valve turned several times on its seat by means of a screwdriver, adding a drop of gasolene. Should the seating of the valve show a bright ring all round its circumference the valve and seat may be replaced, but if this bright ring does not show, the valve must be ground in with the finest emery flour and oil, and the whole carefully wiped clean and replaced.

Now Teaching the Children.

One of the primary schools of Paris furnishes regular instruction in the art of driving automobiles. Children of both sexes receive these instructions and take so much interest in them that the teachers are afraid some of their other studies will be neglected on account of them.



The correct manner of driving an automobile is clearly explained and all requisite information in regard to motors and the construction of the vehicle is also given. Exact models are used for this purpose, and a textbook is now being prepared for the use of children in other schools.

WANTED — A position as chauffeur; seven year's experience; thoroughly understands the construction of gasolene cars and capable of making all repairs. References furnished. Address G. HUSZAR, care of Motor World.

STUDEBAKER Automobiles

----- ELECTRIC -----

NO EXPERT CHAUFFEUR NEEDED.

CAN BE RUN ANY DAY IN THE YEAR,
BY ANY MEMBER OF THE FAMILY.

WIDE TOURING RADIUS. A 1903 electric vehicle with a battery, which is durable and will give a run of 40 miles on one charge.

A SUCCESSFUL HILL-CLIMBER. Our machines will climb grades which are not only steep, but covered with sand and mud.

SMOOTH OPERATION. Controller has four speeds, allowing an unusual smoothness of operation in starting.

RELIABLE BRAKE CONTROL. All machines equipped with two brakes.

STRENGTH OF CONSTRUCTION. Built to be worthy in every point of the Studebaker name and reputation.

Studebaker Electric Automobiles will be exhibited at the Chicago Automobile Show, and can be seen at the following repositories of the

STUDEBAKER BROS. MFG. CO.

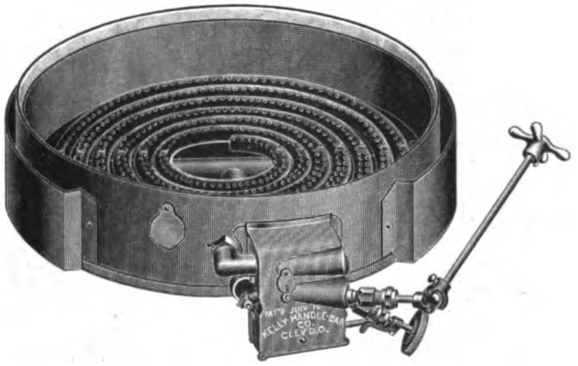
THE NEW

KELLY GENERATOR



for Steam Vehicles is a Trouble Saver.

No Steam Car is complete without one. Does away with drip cups and all annoyances. Perfected in every way and always reliable.

Strongly made with all connections outside. Easily adjusted. No flaring or flashing in lighting, even in the strongest wind. Main fire controlled at seat. Compact and neat in appearance and enclosed in aluminum case.

ADAPTED TO ANY MACHINE

The New One-Piece Steel Tubular Burner

with entirely new casing. Has no gauze or holes in the bottom, the air being taken in from the ends. Absolutely eliminates all danger of fire under-lapping. As there are no air-tubes through the continuous stop-tube the burner even if red-hot cannot back fire. One of the most important improvements yet made. Thoroughly tested—as are all our products. Write for circular.

The Week's Patents.

719,072. Spark Igniting Mechanism for Explosive Engines. Charles G. Annesley, Buffalo, N. Y., assignor to the Buffalo Gasolene Motor Co., Buffalo, N. Y., a corporation of New York. Filed September 13, 1901. Serial No. 75,274. (No model.)

Claim—1. In an explosive engine, the combination of a sparking device, a shaft having a cam adapted to actuate said sparking device, an outer sleeve adapted to be rotated directly by the engine, an interior adjusting sleeve to which the outer sleeve is splined, said adjusting sleeve turning with and adapted to be shifted in the outer sleeve, and a pin projecting from the shaft and adapted to enter an inclined slot in the walls of the interior sleeve, all arranged so that when the adjusting sleeve is shifted in the outer sleeve the shaft and cam secured thereto may be turned with respect to the adjusting and outer sleeves, whereby the relative position of the cam with respect to its coacting part for actuating the sparking device may be varied, substantially as and for the purpose set forth.

719,171. Steering Mechanism for Motor Vehicles. Herbert Austin, Erdington, near Birmingham, England. Filed April 23, 1902. Serial No. 104,411. (No model.)

Claim—1. In a steering mechanism for a motor car or vehicle, the combination with a steering spindle mounted to rotate axially in a part which is rigid with the framing of the vehicle, and the said part, of locking mechanism carried by the fixed axle of the vehicle, gearing operated by rotation of said spindle, adjustable connecting means between the said gearing and the locking means, whereby the latter is operated from the spindle, and means intermediate the steering wheels of the vehicle and said locking mechanism for operating said wheels.

719,179. Vehicle Tire. Frank P. Brining, Westgrove, Pa. Filed July 3, 1902. Serial No. 114,180. (No model.)

Claim—1. A felly having an annular groove formed in the same, a ring of soft rubber secured within said groove, undercut grooves formed in the walls of the groove, a rubber tire, bevelled edges or tongues formed upon the tire adapted to fit within the undercut grooves, an opening formed through the tire, a slit formed from the opening to the inward face of the tire, pins arranged at intervals in the tire and extending laterally across the slit, hooks extending through the felly and also through the soft rubber ring adapted to be hooked upon said pins, means for drawing said hooks toward the felly for the purpose of binding the tire to the felly, as and for the purpose specified.

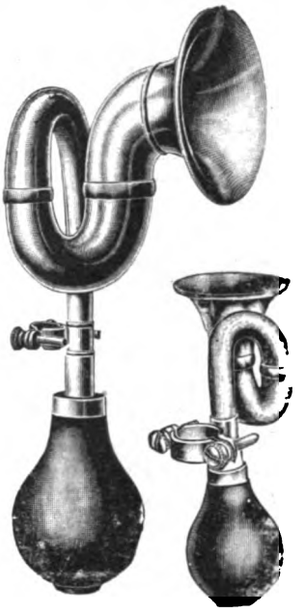
719,199. Internal Combustion Engine. Charles E. Dawson, Hythe, England. Filed December 10, 1900. Serial No. 39,427. (No model.)

Claim—1. In an internal combustion engine of the two stroke cylinder type having an air displacer discharging into two reservoirs communicating with a chamber connected to the engine cylinder through openings situated above each other, a valve controlling the passage from the upper opening of the chamber, above a second valve controlling the passage from the lower opening to the engine cylinder, the upper valve having a hollow stem, and guiding the lower valve, substantially as described.

719,249. Explosive Engine. Bert Niles, Croswell, Mich. Filed April 20, 1901. Serial No. 56,782. (No model.)

Claim—1. In combination; a motor cylinder having a piston, a valve for controlling the admission of exploded gases under pressure to said cylinder, a reservoir for storing such gas, an ignition chamber connected with the reservoir and provided with a piston, a rod connecting the pistons of the motor cylinder and ignition chamber, a cylinder head movable to close the end of the ignition chamber by the pressure of gas in the reservoir and movable to open position by the pressure of exploded gases in the ignition chamber, a compression cylinder connected with the ignition chamber, and means under the control of the pressure of gas in the ignition chamber for igniting an explosive charge therein.

719,315. Storage Battery. Claude H. Everett, Atlanta, Ga. Filed July 8, 1901. Serial No. 67,464. (No model.)



Claim—1. In a storage battery plate, the combination of a support, arms extending laterally therefrom, said arms being unconnected at their outer ends, and sheet metal strips mounted on said arms.

719,326. Cooling Means for Explosive Engines. Herman Gross, Lafayette, Ind. Filed November 14, 1902. Serial No. 131,411. (No model.)

Claim—1. The combination with the cylinder and piston of an explosive engine, of an auxiliary cylinder of larger diameter than the main cylinder, an annular flange carried by the piston and fitting within said auxiliary cylinder, a plurality of ribs arranged on the surface of the cylinder, a jacket surrounding the ribs to form a plurality of air passages, and radial ribs disposed on the head of the cylinder, there being an opening in the jacket for the passage of air, substantially as specified.

719,329. Vehicle Tire Fastener. Jacques C. Haines, Chicago, Ill., assignor of two-thirds to William E. Huber, and Chester Haines, Chicago, Ill. Filed May 19, 1902. Serial No. 107,918. (No model.)

Claim—The combination with a laterally divided rubber vehicle tire having a circumferential perforation, of a retaining wire therein joined at its ends, and a pair of separator, reinforcing bushings 6, surrounding the joint, each bushing comprising a sheet metal cylindrical structure of uniform size throughout its length, pivoted at one end with a laterally projecting flange adapted to bear against one of the severed ends of the tire, and also provided with a series of longitudinally extended perforations spaced throughout its length and adapted to receive protruding portions of the surrounding tire, substantially as set forth.

Motor Car Horns.

All Sizes and Shapes, also fitted with flexible metal tubes.

White Steam Touring Car

FOR 1903

Is a Steam Car of Chassis Construction with the Distance of a Gasolene and the Ease of Operation of an Electric.

To the principle of producing great power and wasting practically none of it is due much of the success of the **"White,"** which of all automobiles has to its credit **four first awards** in the **New York-Rochester** endurance test of 1901; **four first awards** in the **New York-Boston-New York** reliability run of 1902, and its **perfect scores** for reliability in the **great English 650-mile reliability trials** of 1902. But one other car achieved this distinction in the English Trials. These marvelous triumphs may be taken as an accurate criterion of the **"White's"** supremacy.

PRICE, $2,000.00

SPECIFICATIONS.

SEATING CAPACITY,	Four	EXTREME WIDTH,	5 feet
RATED HORSE POWER,	Ten	EXTREME HEIGHT,	5 ft., 2 in.
ENGINE,	Compound	CAPACITY OF GASOLENE TANK,	10 gals.
WHEEL BASE,	6 ft., 8 in.	CAPACITY OF WATER TANK,	15 gals.
TREAD,	4 ft., 8 in.		
WHEELS,	30 inches		
TIRES, (Goodrich Clincher)	4 inches		
WEIGHT, (Tanks Filled)	1600 lbs.		
EXTREME LENGTH,	10 feet		

Condenser, Two Independent Set of Brakes, Automatic Cylinder and Engine Lubricator.

EQUIPMENT:—**Condenser, Side Lamps, Set of Tools, Horn, Tool Case.**

SUCCESS in every-day use, in reliability contests, in races, and in record-trials, has proved the **"White"** system of motive power to be the most noteworthy achievement of automobile developments. The 1903 **"White"** is equipped with every improvement which our experience has shown would be of advantage to the car. Greater power and economy, and greater ease of operation, combined with the noiselessness, has always characterized it.

These advantages are secured by means of a **compound engine**, the **"White" special condenser, a chainless drive, automatic cylinder and engine, lubrication, two independent sets of brakes**, and a variety of minor improvements, which assure the **"White"** purchaser that his vehicle possesses a system of producing and conserving energy unexcelled in the automobile realm.

Safety is the **"White"** keynote. The **"White,"** as is now well understood, has no boiler, and a boiler explosion is, therefor, impossible. The power of the **"White"** car is produced in a generator, in which the possibility of accident is non-existent.

The working parts being entirely encased, the **"White"** is impervious to mud and dust; while its operating parts are so arranged that a lady need have no fear of soiling even a glove in running the car.

HARTFORD or DUNLOP
PNEUMATIC TIRES

The ORIGINAL and "MODEL" TYPES of SINGLE AND DOUBLE TUBE TIRE CONSTRUCTION

Appreciating the fact that requirements vary as to Single Tube and Detachable Tire Construction, we offer the most reliable of both types—*The Honest Standards.*

THEY WERE BEST YEARS AGO. AND YEARS OF INTELLIGENTLY PERSISTENT, CAREFULLY DIRECTED EFFORT HAS MADE THEM BETTER TO-DAY.

Where Quality is desired—where Comfort, Durability, and Protection against Annoyances is wanted—where All-'round Satisfaction is demanded—these tires should be adopted. Let us prove this to you by sending you signed statements from some of the most prominent makers and users in this country.

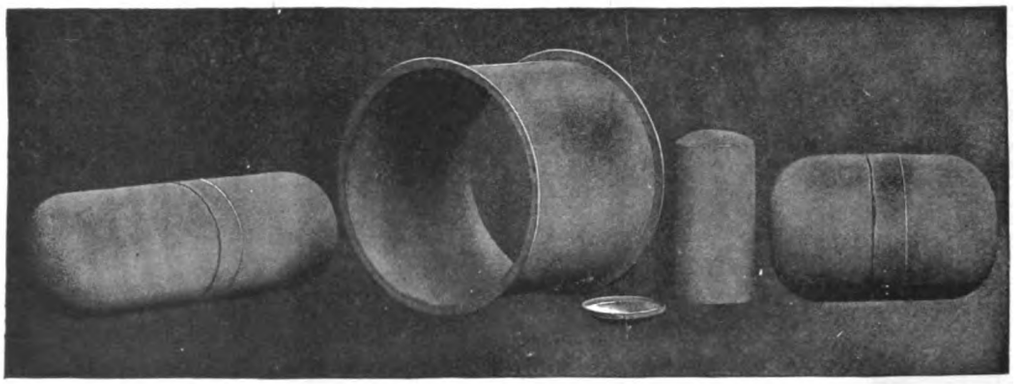
An Open Letter to Automobile Dealers



You are in the business to make money. Your profits depend upon Automobiles sold by you in your territory. Why confine your selling efforts to any one kind of power? All powers have their advantages. The Electric embodies many features of practical worth with a minimum of trouble. ***NATIONAL ELECTRICS*** represent that which is best in the Electric field. To add our line, you are only showing good business judgment. Electrics are going to sell. Why spend your time talking other powers when a customer wants a ***NATIONAL?*** The National agency will prove to be a most valuable asset and money maker. Think it over and write us about our prices, terms and catalogues.

STUDEBAKER Automobiles

----- ELECTRIC -----

NO EXPERT CHAUFFEUR NEEDED.

CAN BE RUN ANY DAY IN THE YEAR,
BY ANY MEMBER OF THE FAMILY.

WIDE TOURING RADIUS. A 1903 electric vehicle with a battery, which is durable and will give a run of 40 miles on one charge.

A SUCCESSFUL HILL-CLIMBER. Our machines will climb grades which are not only steep, but covered with sand and mud.

SMOOTH OPERATION. Controller has four speeds, allowing an unusual smoothness of operation in starting.

RELIABLE BRAKE CONTROL. All machines equipped with two brakes.

STRENGTH OF CONSTRUCTION. Built to be worthy in every point of the Studebaker name and reputation.

Studebaker Electric Automobiles will be exhibited at the Chicago Automobile Show, and can be seen at the following repositories of the

THE STEARNS CAR

Received a lot of very favorable comments at the show.

The style and general design is right. The motor is powerful, with a perfect throttle, and runs silently and with no vibration. The attachments on the dash and controls at the wheel are good points. too. The small tube radiator is ahead of the time, and considering all things, **STEARNS CARS are worth more than they cost.**

The Oldsmobile

THE CAR WITH A RECORD.

The satisfactory service of this world standard runabout means more than all the claims of its imitators. 7000 machines in daily use for the past three years prove more than the theoretical arguments and experimental efforts of the "paper manufacturers." The OLDSMOBILE is built to run and does it.

The development along the most practical lines of this mechanical marvel marks the most advanced stage of automobile construction and keeps the OLDSMOBILE "The best thing on wheels."

PRICE, $650.00.

Each working part is as simple as skill can devise, as strong as the best Drop Forgings can make it and as efficient as mechanical perfection can produce. There is nothing problematical in the OLDSMOBILE.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, February 12, 1903. No. 20

WANTS CONTEST ABANDONED

N. A. A. M. Votes Against Commercial Vehicle Test—But it Will Probably Occur.

Among other things done at the meeting of the Executive Committee of the National Association of Automobile Manufacturers, which was held on February 4 to elect officers, was the running through of a resolution stating that the organization was opposed to the holding of any contest for commercial motor vehicles this year. The resolution embodied a clause providing for a copy of it being sent to the Automobile Club of America, which, as is known, has been planning to hold such a contest this spring.

The news of this action was not given out promptly, and after an inkling of what had happened had been obtained it was impossible to get a copy of the resolution from the secretary or any information about the proceeding beyond the admission of the fact that such action had been taken, and that the vote had been unanimously in favor of it. The pompous secrecy affected by the reintrenched secretary concerning the doings of the association prevents the name of the father of the resolution from being known, and also whatever of reason for it might have been offered.

The resolution was forwarded to the Automobile Club, and there, for the present, it rests, no official action having been taken on it.

Inquiry among members and officials of the club brought out expression of the sentiment that it was not likely that the resolution would lead to any alteration of the plans of the club to hold a contest. As one man put it:

"The club went into this thing at the solicitation of certain manufacturers. The N. A. A. M. as an organization was not asked what it thought about it, but letters were sent out to all the various manufacturers asking them to confer with the Contest Committee of the club and express their views. If the manufacturers do not want to enter such a contest the club does not want to hold one. The club has no axe to grind, and seeks to do only what it believes to be for the good of the sport and of the industry. The manufacturers individually do seem to want such a contest, however, for on January 22 representatives of eight firms met with the committee at the clubrooms, and all seemed to be unanimous in favor of the proposed event. At the same meeting letters of approval were at hand from half a score of other concerns, and since then further indorsements of the plan have been received by mail. I see no reason why the club should abandon its plan, and I think it will not do so. To some it looks as if those who now have the 'cal' on the commercial vehicle business wanted to prevent a contest, because it might bring into prominence the cars of some other concerns now lesser known, and I shouldn't wonder if those who think this way are more than half right. At any rate, that is the view the general public is apt to take of such proceedings."

Have Joined the N. A. A. M.

The Hoffman Automobile Co., of Cleveland, and the Neftel Automobile Co., of New York, were elected active members of the National Association of Automobile Manufacturers at the last meeting of the executive committee. The American Coil Co., of Somerville, Mass., was elected to associate membership.

Conrad Names Directors.

Notice was filed in the County Clerk's office in Buffalo last week by the Conrad Motor Carriage Co. to the effect that M. M. Drake, F. P. Conrad, G. W. Atterbury, E. B. Olmstead and W. E. Pengot had been elected directors.

Miller Going Abroad.

Charles E. Miller, the well known New York jobber, has booked passage for Europe. He has several irons in the fire on the other side.

Slusser Appointed Sales Manager.

R. W. Slusser has been appointed sales manager of the Fredonia Mfg. Co., Youngstown, Ohio. He assumes the duties at once.

CLEMENT DEFERS MANUFACTURE

French Maker Will Send Over Complete Cars now and Establish American Factory Later.

Prior to sailing for France last week, M. Clement came to a decision regarding the plans of his American company, the Clement Cycle Motor & Light Vehicle Co. The manufacture of complete automobiles at Hartford will be postponed for a year. During 1903 Clement cars will be imported, and meanwhile preparations will be made to produce them in their entirety next winter, so they will be ready for the 1904 market.

The postponement was necessitated by the impossibility of making the necessary additions to the Hartford plant in time to prepare for the approaching season. Machinery will be laid down on an extensive scale, M. Clement's predilection for the best obtainable in this line being well known. The Clement cars have met with a ready sale, and this has led to an enlargement of the French plants as well as to the determination to manufacture in this country.

Before sailing M. Clement expressed himself as being much impressed with the immensity of the American market for automobiles, and stated that his plans were largely due to this fact.

McCrea Resigns.

J. W. McCrea, sales manager for the F. B. Stearns Co., Cleveland, has resigned that position. As he is lacking neither ability nor popularity, he is certain to be heard from shortly.

White Sold up to June.

"The demand for our touring car is simply remarkable," said Windsor T. White, of the White Sewing Machine Co., when in the city last week. "We are sold right up to June, and the orders are still coming."

To Enter Automobile Field.

According to a press dispatch the Eckhart Buggy Co., of Auburn, Ind., will manufacture automobiles.

WHY FRANCE WANTS IT

Acquaintance With Course a Big Factor in Cup Race—Mercedes Features—Pemanent Show Proposed—Serpollet's Innovation.

French Bureau Motor World.
2 Rue d'Abbeville.

Paris, Jan. 26.—No decision has yet been arrived at as to where the Gordon Bennett race shall be held. The A. C. F. is more than anxious that the race should be held over the French roads, which are not only the best, but which are also the best known to the French competitors. It is a very important factor in a race to know the road perfectly, for not only is there no hesitation and consequent slowing down to decide which turn to take, but also, if one knows the road perfectly, one knows where the highest speed may be indulged in without risk, and where it is necessary to slow down and go carefully. The French chauffeurs know every inch of the Paris-Bordeaux road, and therefore the A. C. F. is making most strenuous efforts to have the race held in connection with the Paris-Madrid race.

The details with regard to the Mercedes cars of 1903 pattern are beginning to leak out. In the first place, the Cannstadt Daimler Co. are making a special racing model which has nothing in common with the touring cars they intend to turn out. The racing cars, it is said, have motors of 100 horsepower situated in the middle of the car, instead of in front. The driver is to be seated over the back axle, which, it is said, is to be a live axle. The greater part of the weight of the car will therefore be situated over the driving wheels, which will therefore bite the ground much more efficiently. The steering pillar is said to be almost horizontal. In the touring cars the Mercedes 1903 models are four in number, viz., 18, 24, 40 and 60 horsepower; and there are several important changes in the details. The ignition arrangements where they make the rupture in the cylinders are to be placed on the front of the cylinders, instead of on the side, as in the 1902 model. They will therefore be much more accessible; otherwise they are practically the same as in the old model. A plug hole is left, however, and in this an ordinary sparking plug can be placed for electric ignition by means of a high tension spark. The admission valves are very large, and are placed on the top of the cylinders in the same position as the inlet valves on the Buchet motor. The change of speed gear, instead of being worked by means of racks and pinions, is worked by cams which are actuated by a slotted disk. The clutch is completely transformed, and rather resembles the Clement clutch. Instead of winding around the driving shaft, as in the 1902 model, the clutch consists of a steel band which expands and presses against the inside of the large hub of the flywheel; the outer portion of the flywheel, outside the hub, forms, as usual, the fan which sucks the air through the multitubular radiator.

Paul Meyan in the France Automobile makes the suggestion to open a permanent exhibition of aautomobiles in the Palais Royal. It will be remembered that the Palais Royal, situated behind the Avenue de l'Opera and close to the Comedie Française, used to be the centre of attraction in Paris. It is an immense building, making the four sides of a square and surrounding a large garden. It used, as it name indicates, to be a royal residence, but gradually, as the city of Paris grew, the aristocratic residential quarter went further and further westward, and the Palais Royal was let off for shops and offices. It then became the most fashionable resort, and the best jeweller shops were to be found there, and in the gardens there was always music to a fashionable audience of promenaders. Gradually, however, the shops drew out westward, first to the Avenue de l'Opera, then to the Rue de la Paix, and lastly to the Rue Royale, and the Palais Royal fell on evil times. At the present day most of the shops are to let, and those that have tenants sell only imitation jewelry, photographs and cheap articles of one kind or another, and the passages and gardens are mostly deserted. Fashionable Paris hardly knows where the Palais Royal is. Paul Meyan's idea is to turn it into an "automobile city," and certainly it would be an ideal place for the business, and worthy of the great trade which has developed with such rapidity during the last decade. The question is being studied carefully by those interested in the trade, and shortly a scheme will be put forward to accomplish this happy result.

Mr. Leon Serpollet, of the firm of Gardner & Serpollet, the makers of steam cars, is at present at work on autocars for use on the railroads. Mr. Serpollet, after long experiments, has found it possible to make an autotrain which can run at an average speed of 75 miles per hour, including stops, and the Paris, Lyons and Mediterranean Railway Company has given an order for one of these cars, to run between Paris and Marseilles, with thirty passengers. The distance is 437 miles, and the journey takes at present eleven and one-half hours, whereas the autotrain will accomplish it in less than six hours. The motor and boiler will be of 250 horsepower, and will be placed very low down, in order that the car may be stable around the curves; they will be placed at the front end of the carriage, which will have a wind shield in front. The car will be 17 metres, or 18⅝ yards, long, with a distance of 14¼ yards between the axles. There will be five compartments, each holding seating room for five passengers, and the rear part of the car will be formed into an observation car. The introduction of these autotrains, if successful, will lead to a great change in the future in railway travelling. Special autotrains will be much more accessible to the public, and it will be possible at a comparatively small cost to have one's own special autotrain fitted up with all one's comforts and conveniences.

It has been suggested that it would be a good idea for the French Automobile Club to fix the dimensions of the motors to be used in the great races. The idea has been officially brought before the Chambre Syndicale de l'Automobile, and may become a part of the "Circuit" which they are organizing for the summer season. No new rule could, it is asserted, be more beneficial to the trade, for it will enable one to judge with precision the relative merits of the methods applied by different makers. For instance, in order to have a certain volume in the cylinder, the stroke and bore may be varied almost indefinitely. Some makers claim that equality in bore and stroke gives the best result; some, on the other hand, prefer a long stroke and a small bore, whilst others again adopt a wide bore and a small stroke. It is almost impossible to tell which of the three systems is the best, for in almost every case the volume varies. If, however, in a big race the volume is fixed beforehand, one will be able to judge fairly accurately and choose the best arrangement.

Cold Weather Activity.

During the few days of cold but clear weather that New York City has enjoyed recently there was abundant evidence that automobiling activity is not a matter of season. At various stations visited it was found that there was plenty of action among the "boarders," the hands being kept fully busy attending to the cars going out and coming in. At more than one garage the floor looked so empty on Monday as to provoke comment, and the condition was explained not by a lack of patronage, but by the fact that the cars of patrons were being used by them.

About nine-tenths of all the cars kept on storage in public stations are in active commission all winter, according to the statements of those in charge. The signs of this activity are noticeable in a casual glance about the stations, at the number of cars equipped with glass panels in front, canopy tops and side curtains. At the Automobile Exchange in Thirty-eighth street the big Mercedes of H. S. Harkness stands thus rigged every day, ready for a call at any time, and it is only one of scores of carriages kept in similar readiness by well known operators. At the station of Barry & Hayes, in East Fifty-eighth street, it was noticed that the Winton touring car with a canopy top belonging to Reginald Vanderbile had received a new coat of white paint and looked fit for a trip of any sort up to a bridal tour.

From Windsor Castle to High Wycombe, eighteen miles in forty-five minutes, is the record established last week by King Edward in an automobile. This figures out twenty-four miles to the hour, just double the legal limit. No arrests followed.

AWAKENED CLEVELAND

Show Performed a Good Service Locally, Many Actual Sales Being Made—Two New Cars Shown and one of Them Tested.

Cleveland, Feb. 8.—Despite the conspicuous absence of several prominent local manufacturers, the Cleveland Automobile Show, held at the armory of the Cleveland Grays, which closed last night, was a pronounced success. The show was promoted by Captain Shupe, George Collister, W. F. Sayle, and "a fellow named Hanks," the latter no less than the redoubtable Chas. B. —Winton Hanks, of course.

From all reports a surprisingly large amount of business was done, the attendance during the week being good and of a high class, and the management of a kind that other local shows would do well to pattern after. Incidentally, the value of local shows in crystallizing opinions and in transforming possible purchasers into actual buyers was eye-opening.

It is strange that despite the prominence of Cleveland as an automobile manufacturing centre, sales locally have not been anywhere near what might be expected. The same reasons why a prophet is not without honor save in his own country is probably responsible, so many prominent cars being made here that proximity to them and familiarity with their names resulted in indifference and apathy.

The show has changed all this and may be said to have waked up Cleveland to a true appreciation of what it has been missing and what the rest of the world has realized for some time. The result was a rush of orders, Winton selling many more cars than had been apportioned to the city, while the other local cars exhibited, such as F. B. Stearns, General Auto & Mfg. Co., Hoffman, and others, were jubilant over the volume of business done.

Even the non-exhibitors like Baker, White, Peerless and American felt the stimulus in a sudden and unlooked for increase of local orders.

As a sample of the business done by out of town exhibitors, the Shelby Motor Car Company sold four big touring cars and six of their combination two and four passenger vehicles, whereas up to this time they had been unable to get a foothold in the city. Better known cars did correspondingly better, among them being the new gasoline Locomobile touring car, Yale, Autocar, Searchmont and others.

Of the smaller cars Oldsmobiles, of course, Northern, Elmore and Cadillac led the way and interested an army of buyers. Similarly, in the electric class the Columbia, National and Waverly in addition to the Baker, all did well.

Most of the exhibits were by local agents, that of the Cleveland Auto & Supply Co. being most imposing. This concern showed Columbia, Waverly and Studebaker electrics, Locomobiles in gasolene and steam, Searchmont, Cadillac, an Orient buckboard, a motor bicycle and an extensive line of sundries and parts.

The Ohio Motor Car Company, with a fine display of Northerns, Nationals and others, also made a brave showing.

The tire makers on hand were Diamond, Goodrich, Fisk and Hartford, while among accessories and parts Kelly generators, Veeder, 20th Century, Westinghouse and others shone forth.

In novelties a new four-cylinder chassis with balanced motor placed crosswise and a direct drive, the shaft being placed at an angle that caused much shaking of heads among the sharps, was shown by Rogers & Thacher Mfg. Co. The motor was said to deliver about 35 horsepower, and the exhibit was a rallying place for the curious during the week.

There was also exhibited for the first time the "Union" automobile, made by the Union Automobile Company, of Union City, Ind. It has been thought best to mention this separately first, because of its being a newcomer in the show line, and, second, because of the truly marvellous demonstration it made with a Motor World man as a passenger.

First, the car is a heavy, even clumsy looking vehicle of the convertible two and four passenger style, a cross somewhere between a runabout and a touring car, inclining more toward the latter with its big 34-inch wheels and great weight. However, if handsome is that handsome does, the Union must be accorded a high place, for in the Lambert engine and transmission it has a motive power that will literally take it almost anywhere with absolutely no fuss or trouble.

This engine is of 8 horsepower, two-cylinder, four cycle balanced type.

The crank is carried in the centre of the engine with a cylinder of both ends. Both cylinders act on the one crank-shaft, which is of the double-throw type. By this arrangement one piston balances the other, one connecting rod balances the other, and the shaft balances itself. Therefore, no weight is needed on the flywheel to balance these parts. The Lambert is a truly balanced engine and there is an absolute freedom from vibration of any kind at any time.

The transmission is of the much-discussed, much-maligned friction system, but it does the business. The flywheel of the engine is of the disk variety, its face covered with a patented composition plate of special friction qualities.

The friction wheel is set direct on this plate, the shaft which carries it being placed parallel with the centre, the wheel being moved in either direction on the shaft and across the face of the friction plate by means of the controller lever.

With this engine and this transmission a Motor World man was taken first up the Water street hill, from the Erie depot, next down the hill by the viaduct to where the Detroit and Buffalo boat landings are. Two-thirds down this latter hill the engine was reversed and the car easily backed the entire way up the hill, never faltering for an instant or making any fuss whatever.

To anyone who knows this grade the performance can be appreciated. Sufficient to say it is one of the steepest to be found anywhere.

After this the Lake Shore depot hills were easy, though they both are climbs of the severest kind. No attempt whatever was made to "rush" them, the car simply keeping on its way up the same even rate of speed of which it had been travelling.

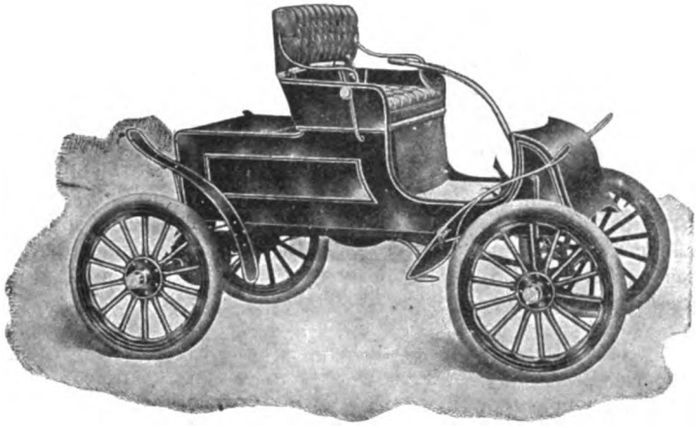
There was absolutely no vibration, no pounding, no strain. The facts speak for themselves, and are given simply because they are facts and of the kind that are thought worthy of recording.

With the faults of style and superstructure corrected the Union would seem to have possibilities.

A pleasant feature of the show week was a smoker and vaudeville given on Thursday evening after the close of the show. One hundred and twelve of the exhibitors and visitors attended, and all had a good time.

If Alexander Winton is "mentioned" for President of the United States don't be surprised. What he doesn't get in the way of press notices isn't worth getting. During the Cleveland show a few of the newspaper men were told—sub-rosa, of course—that the three warring Republican factions of Cleveland—the Hannaites, the Kissonites and some other ites—had hit upon Winton as the very man to unite upon and defeat the terrible Tom Johnson, that they had but the very evening before sent emissaries to Winton urging him to accept the nomination, pointing out that the very fact that Winton was not a politician was all in his favor, that he was the best-advertised man in the city, etc.

Perhaps the fact that Winton would out-red-devil Tom Johnson's famous red-devil campaign might have had something to do with it: and again, perhaps the fact that Alex Winton has, in the person of one Charles B. Shanks, a press agent that a prima donna might envy, may have had something to do with the story.



However, the report had it that Winton, like the canny Scot he is, turned a deaf ear to the entreaties of the politicians, resisting all their blandishments, and gently but firmly declining to be interrupted in his work of building the cup-racer by such a trifle as running the city of Cleveland.

If the Bennet Cup race does not take place in Ireland it will not be the fault of the Irish people. They heartily favor it. A poll has been made of the Irish members of Parliament, and without a single exception they have promised to vote for a bill legalizing the race.

☞ Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceeding the date of publication.

☞ Those who are interested in motor vehicles will find the facilities and information of our office always at their command

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, FEBRUARY 12, 1903.

"Inadvertently I allowed my subscription to The Motor World to lapse, but I have just renewed it through an agency in Boston. I value it too highly to wish to go without it, as I think it the most independent of them all. But the price is too low; you ought to charge $5 per year."—Elliott C. Lee, Brookline, Mass.

Let the Contest go on!

A great deal of speculation as to the motives that inspired the action has been stirred up by the adoption of the resolution by the N. A. A. M. against the holding of a contest for commercial vehicles this year. Foremost among the speculations has been that of whether or not the action was inspired by fear of open competition.

A certain few concerns represented on the executive committee of the N. A. A. M., making mostly electric trucks and delivery wagons, now have almost a monopoly of the business in motor vehicles. They are broad spirited and progressive concerns, to whom the imputation of petty jealousies and fears of rivalry would seem unjust, but such is the tendency of the public mind that this will be the most natural course for it to take.

It is true that there are known now to be in the field several manufacturers of steam and gasolene trucks who probably would welcome a contest open to all in which they could show the superior radius of distance that such vehicles have over electric trucks. It is generally understood also that there are others, as yet hardly heard of, who are experimenting in this field, and who would in all likelihood be brought out by such a contest. The development of newer trucks and wagons cannot be prevented by any such course, nor can their existence be kept from the knowledge of the public by any narrow minded attempt to suppress a contest that is in line with the public sentiment. Such a course can only react upon those who incite and support it.

The folly of the action quite justifies the general condemnation it has received and is certain to receive. It is not only futile, but unnecessary. There is certain to be a demand for business wagons and trucks having a wider range of service than can be given by electric vehicles, and this demand is just as certain to be supplied. No effort of the electrical manufacturers can stop it. It is simply silly for them to fear it. The electric truck and wagon, like electric runabouts, have a sphere of their own in which they cannot be displaced, but vehicles of other power must do what they cannot do. Horse drawn delivery wagons now carry goods to places twenty miles away from the metropolis, and motor delivery wagons must be supplied to do the same, and incidentally climb the hills of the suburban roads.

The electric truck has no call to play dog in the manger, because the electric motor has one feature of superiority for commercial use that seems likely to keep it ever in the van for hauling goods about the city or within a limited radius. This feature is its simplicity of operation and control. Always the steam and gasolene engine will for business uses be handicapped by the fact that they require an operator somewhat superior in intellect to the average truck driver, or at least one with experience, while the most ordinary sort of workman can be sent out with an electric motor after very brief instruction. He needs no mechanical ingenuity. This fact alone assures the electric wagon and truck a permanent and probably predominant place in city hauling. It cannot hope to have the long distance cross country work. Why should its sponsors seek to prevent the long distance wagons from demonstrating what they can do? It is a short sighted policy, truly.

The contest committee of the Automobile Club has proven itself too wise and just in the past to warrant any fear that it will ask anything that is unreasonable in the way of a test. The club has no axe to grind in this matter. It undertook to promote the test in response to the requests of some manufacturers. Its proposition to hold a contest was indorsed by a number of prominent makers. The N. A. A. M. was not asked for its opinion. It was quite natural that the adoption of the resolution and the forwarding of it to the club should be regarded as an impertinence. The club is an organization quite capable of acting independently of the N. A. A. M. and proceeding with its plans. It should do so, and it seems quite likely that it will do so. If the manufacturers who fathered the impertinent resolution do not want to go into a competition open to all it is their privilege to stay out. The business public that is interested in the demonstration of commercial vehicles will be at liberty also to draw its own inferences.

There is no reason why a contest could not be arranged to suit all styles of business vehicles. The committee of the club has already announced that a good part of the course will be through city streets. This would be just the thing for the electrics. If the steam and gasolene vehicles seek for a test involving distance and hill climbing separate classes easily can be arranged for them, and the electrics can gracefully withdraw.

Both the virtues and the limitations of the electric wagon are pretty thoroughly understood now. An attempt by the electrical makers, who now have the trade, to keep the steam and gasolene trucks in the shadow would fool no one.

By all means let the A. C. A. proceed and arrange a contest that will show what each class of vehicle is capable of doing. There is room for all. The demand for commercial vehicles is here. The business public wants to know what they can do. For the good of the sport and the industry, and in the name of progress, hold a contest and show them.

Future of Big Touring Cars.

One of the subjects much talked about of late concerns the future of the expensive, expansive, high powered touring car. None doubts its impressive magnificence; indeed, it is this very magnificence, unmistakably conveying suggestions that such cars are only for the rich, that has given rise to discussion.

With so many makers engaged in their production there are those who are fearful that overproduction may ensue, and it is not to be denied that there are some grounds for caution of the sort, if not for fear.

To undertake to estimate the number of people to whom cars at from $2,500 to $6,000 are possible would smack of wild guesswork; but it is reasonably safe to say that the number is limited, if not narrowly limited, then limited at any rate. It follows that the production of cars that appeal to this class must be, or should be, limited. Happily their construction is such that they cannot be turned out in great numbers, but as the touring car is now in the ascendancy there may in some quarters exist a disposition to force production, and to reckon without regard to the future. We prefer to believe, however, that makers are fully aware that there can be but a comparatively limited demand for big cars, and have reckoned and are reckoning accordingly. We take small stock in the fear that a glut will result or stagnation follow.

The touring car is so inviting and so companionable that its future must within reasonable bounds continue to enlarge. In time, the natural lowering of price will make for this enlargement, but at present there is no sign of or reason for it, and as comparatively few manufacturers have all their eggs in the one basket, the danger or overproduction and the troubles which it carries in its train is more of sound than of substance.

The maker who produces a high priced article of any sort and does not see that the demand must necessarily be of relatively narrow and narrowing limits, is a poor manufacturer, and a poorer merchant, and should seek some other sphere.

Common Sense in the A. A. A.

Up to date the American Automobile Association has been chiefly remarkable for what it has not done. The same is true of the American Motor League, the latter's most notable performance being its recent selection of a man who is not even an automobilist as its president. And yet the numerous successive waves of adverse legislation and good roads movements never offered more fertile fields for useful and effective labor.

The first glimmer of hope, and, we may add, of common sense, that has been discernible since the organization of either rests in the suggestion discussed by the directors that membership in the association be thrown open to individual automobilists, a suggestion which we offered and urged at the time of its formation. The club limitation is a narrow one, and makes the association untrue to and unworthy of its title.

The aims and objects of the Association and the League are identical. Why there should exist two weak and commonplace organizations when one strong one could work to so much better purpose, is beyond us. There is no reason for it. What is good for the individual is good for the club member, and there is no reason why they should not work in harmony for the common good.

We believe they will do so, and as the stronger of the two, the American Automobile Association is the one to show the way. The long and short of it is that the League and the Association should consolidate. As the former is living not more than a nominal existence and has forfeited hearty support by choosing a man not an automobilist for its head, it has little to lose, and the one stronger organization that should result from amalgamation should accrue more substantially to the interests of automobiling than has the weak and divided and halfhearted efforts of the past.

"We desire to congratulate you on the completeness of the Motor World's New York show number. It covered the ground considerably better than any other paper published, and established a record for completeness of work that will be difficult to beat."—(Thomas B. Jeffery & Co., G. W. Bennett, sales manager.

Antomobile Instruction.

Pedagogic instruction in automobile construction and operation is apt to be looked upon askance by some who pin their faith utterly to the efficiency of the school of experience. The fact that Columbia University has decided to introduce a course in automobile engineering is not one to be regarded lightly, however. It is an eminently proper move, and one apt to be far reaching in its results. The knowledge to be gained through the medium of a course of lectures, however ably illustrated they may be, will not be the same for practical purposes as the knowledge gained in the shop and on the road, but in some respects it may be of wider scope and more thorough, and may better prepare a man for unusual exigencies than the knowledge possessed by the average operator, which too often is limited to the features of his own machine. A thorough theoretical knowledge of the subject is a splendid aid to the scientific imagination when it is called upon to conceive of what the difficulty is in a strangely new piece of trouble.

In Paris, it is said, the operation of automobiles is being taught to children in the primary schools. This looks like carrying the matter a bit too far, but it would not be a bit bad if the policemen of our big cities were compelled to know a thing or two about automobile engines. More than one policeman has run amuck trying to take a stray machine to the station house, and in the future, when the automobile is in general use, the need for proper knowledge of them by policemen will be multiplied. It is a sight worth stopping to watch when a giant policeman of the Broadway squad in New York starts in to straighten out a tangle of obstinate and profane truckmen. The policeman cannot be "jollied" by the drivers. The horses are yanked this way and that by their bridles and the road quickly cleared. But what would the same big policeman do with a tangled blockade of motor trucks and wagons of steam, gasolene and electric motors? If he knew no more than he does now he would be helpless, and have to accept any sort of absurd excuse the truckmen might give for being unable to "back up" or "slew around." Perhaps in the near future some questions on practical automobiling will be included in the Civil Service examination for policemen.

In sacrificing everything to the high speed some makers produce cars that are noisy and disagreeable when going slowly. In ignoring this they seem to loose sight of the fact that cars cannot always be driven on the high gear. In city driving particularly this is true, and a noisy car will attract more attention there than any other place.

As the costliness of the horse, no less than his lack of efficiency, becomes better known by reason of the more extended use of the self-propelled vehicle, he is certain to be regarded as a luxury instead of, as now, a necessity.

DETROIT SHOW OPEN

Music, Motor Cars, Dogs and Sporting Goods Comingle and Draw Good Crowds.

Detroit, Feb. 9.—The second annual Automobile and Sportsman's Show opened to-night to the strains of the Metropolitan Orchestra and the baying of the dogs that comprise the Bench Show, which is included in the affair.

The decorations, generally speaking, are tasteful, and with cars, dogs, guns and the like in evidence it cannot be said that the show lacks variety or that there is not plenty to be seen.

The crowd that is in attendance to-night argues well for the week.

The exhibifors are as follows:

AUTOMOBILES.

The Oldsmobile Co., Detroit, W. C. Rands & Co., managers, had their brougham that attracted so much attention at the New York and Cleveland shows, their new touring car and, last but not least, their regular runabouts. Their booth was always crowded, and W. C. Rands, Roy Chapin and James Brady, with a corps of assistants, were kept busy.

W. E. Metzger, Detroit, had one of the largest exhibits, comprising the Winton, Cadillac, Toledo, Peerless, Baker, Waverly and Columbia cars. Besides Mr. Metzger, Messrs. Riggs, Newman, Brady and Hurlburt were on hand to take care of visitors.

J. P. Schneider, Detroit, showed the new models of the Elmore, Northern, National and Marr autocar. One of the features of the exhibit was the Northern racer, in which Mr. Maxwell, of the Northern Co., turned a somersault at the Grosse Pointe races.

W. H. Weber, Detroit, had his new lines, comprising the Searchmont, Conrad, Orient and Rambler. The Orient buckboard came in for lots of attention. The Searchmont medals for reliability were also shown.

White Sewing Machine Co., Detroit, had two of their regular model runabouts and their new steam touring car. They were all in white, as usual; they reported the first sale of their touring car in Detroit to H. S. Pingree, son of the late Governor of Michigan. Mr. Robinson and Messrs. Grant and Wright were in charge.

Wheeler Mfg. Co., Detroit, a newcomer in the auto world, exhibited a touring tonneau and runabout. It can be said truthfully that their designer and builder has started right, for two neater looking cars have never been shown.

Kirk Mfg. Co., Toledo, Ohio—The Yale has been so favorably commented on that little remains to be said. This car always draws, and Mr. Kirk's rotund face is always smiling. Mr. Bragg is also on hand to assist Mr. Kirk.

Flint Automobile oC., Flint, Mich., are showing their Roadster model. Mr. Hardy and Mr. McPhillips are always on hand dwelling on its merits.

Jackson Auto Co., Jackson, Mich.—The Jaxon steamer, a clever machine, reflecting a great deal of credit on B. J. Carter, its designer, who is in attendance.

The Autocar Co., Ardmore, Pa.—This company, through its Chicago agent, F. P. Illsley, showed two cars of this popular make. The booth was always surrounded by an admiring crowd.

Sandusky Automobile Co., Sandusky, Ohio, had their sign up with a card stating to ask the R. R. man. Their car is expected to arrive to-morrow.

The Ide-Spomeg-Huber Co., Detroit—This firm showed the built over News-Tribune electric delivery wagon. They have put a four cylinder upright engine into it, so it can carry its papers all over the city.

Tom Cooper's "999" is shown, and this always has a crowd of the curious around it.

AUTOMOBILE ACCESSORIES.

Fisk Rubber Co., Detroit Branch, showed a complete line of single and double tube automobile tires. The latter is the one that created so much comment since its introduction. Its merit is apparent at a glance, and its success is positive. Manager Broadwell and his assistants, Messrs. Lutz, Lambe and Kerchoffer, were in charge.

Twentieth Century Mfg. Co., New York—What would a show be without "Governor" Castle and the 20th Century lamps? All styles are shown, of course.

Hussey Auto & Supply Co., Detroit, are showing their well known radiators, tilting wheels, running gears, etc., and, naturally, that old timer, P. L. Hussey, is in charge.

Briscoe Mfg. Co., Detroit—This firm are showing their radiating coils, tanks, etc.

B. F. Goodrich Co., Akron, show their complete line of pneumatic and solid tires, in addition to part of their art gallery, with the beautiful Kate and Aida.

Diamond Rubber Co., Akron, Ohio, show their solid, single tube and clincher tires, and of course their now famous "non-blooming" inner tube. Mr. Perrett and Mr. Snyder are in attendance.

Those who show sporting goods are as follows: The Fletcher Hardware Co., Union Metallic Cartridge Co., Winchester Arms Co., Marlin Arms Co., Hunter Arms Co., A. J. Reach & Co. and Jas. A. Marks Co.

Gas engines and launches were shown by Charles A. Strelinger Co., A. L. Melvin, Truscot Boat & Launch Co., Bloomstrom Launch Co., M. Dingfelder and L. C. Steers.

Florida Speed Trials Likely.

It seems to have become a settled fact that there will be a series of straightaway races on the Florida Beach at Ormond during the week of March 9. The Florida Automobile Association, projected at the time of the New York show, has been successfully organized, the railroads and hotels of Florida have stepped forward to help, and the plan now appears to be assured of success.

W. J. Morgan, the father of the scheme, and W. J. Stewart, chairman of the Race Committee of the Automobile Association, are now in Florida having the course surveyed and attending to the necessary preliminaries.

MAY BECOME DEMOCRATIC

A. A. A. Directors Sensibly Consider the Logical Enlargement of Their Organization.

There is a prospect of serious rivalry and perhaps a clash between the American Automobile Association and the American Motor League, which were organized during the same week a little less than a year ago at Chicago. The clash, however, if it comes, is apt to be something like the meeting of a trolley car with a peanut on its tracks, the League in this case being the peanut.

Promise of the conflict is found in the idea that has come into the head works of the A. A. A., to extend the scope of the organization by admitting individuals to membership.

When the A. A. A. was formed it was laid out on the basis of a federation of clubs, and it has clung to that idea ever since. It has taken the control and regulation of the sport, and grown in power and wealth. In order to increase its popularity and let in the little clubs, the dues recently were reduced from $3 a head to $1 a year for every member in the clubs belonging to the organization.

The American Motor League may be said to have been started in direct opposition to the American Automobile Association, on the theory that the A. A. A. would be an aristocratic and exclusive body that would be dwarfed by a popular, democratic organization formed on the basis of unit membership, open to all, whether club members or not. The League has done nothing beyond theorize, however, and now the body that has waxed strong threatens to open its doors to individual members the same as the A. M. L.

This was the chief theme of discussion at the regular monthly meeting of the directors of the A. A. A., held on Tuesday at the Automobile Club. Of course, the directors could take no positive action in the matter, for it would necessitate a change in the constitution that would have to be voted upon by the members at a general meeting. There was enough sentiment in favor of it, however, for instructions to be given to the secretary to investigate and see what changes in the constitution and bylaws would be necessary for the association to admit individual members and establish them and the clubs on an equitable voting basis. This is the attitude which the Motor World recommended the A. A. A. to take at the time of its formation.

Dr. Julian A. Chase, of the Rhode Island Automobile Club, the new president, occupied the chair at the meeting, and others present were W. E. Scarritt, representing the Automobile Club of New-Jersey; A. R. Pardington, Long Island Automobile Club, and Harlan W. Whipple, Automobile Club of America.

Commentary

Suppose you may have seen in the papers that they had a railroad accident over in New Jersey recently which resulted in the deaths of a number of passengers. The accident is believed to have been the result of the engineer of the colliding train passing a danger signal without seeing it, because he was at the moment of passing it attending to a leaking valve or something else of the same kind. With so excellent an opportunity to do something for "the peepul," one of the yellow papers has introduced a bill in the New Jersey legislature which aims to make railroads in future employ two engineers on each locomotives. If such a law is passed you may expect the same idea to be extended until the automobilist of the future will be compelled to employ two licensed chauffeurs each time he goes upon the public thoroughfares. The argument the yellow paper makes for the necessity of two engine drivers can be made to serve equally well when employed against the automobile; besides, just see what a glorious opportunity this affords for a blatherskite legislator to win at one swoop the eternal gratitude of the horseman, the farmer and the chauffeur!

* * *

When you fear something is going to happen to yourself or to the vehicle you are riding in, remember trouble is like money—it is better to save it than to borrow it.

* * *

What is the matter with the city of New York? What does it mean by neglecting the comfort of the owners of several thousands of trotting horses of varying degrees of speed? After spending a beggarly $6,000,000 for a speedway for the sole use of these citizens and their trotters, the city has now neglected to keep that miserable little concession to the most cultured and modest of its citizens in a way entirely satisfactory to them. What matters it if the city is short handed, and that the common, ordinary citizens are forced to go without proper street cleaning, etc.? Is that any reason why the city should neglect the pleasure and comfort of the trotting-horse owner, by not seeing to it that his especial roadway is swept and kept according to his liking? Well, I wot not! Vide this complaint from "An Oldtime Road Driver" in a Saturday evening paper:

"Instead of being maintained in its proper form, the Speedway to-day is a disgrace to the city, and unless some improvement is soon made it will be the means of driving to other places the horsemen from this and other cities who have made it a practice of visiting the Speedway daily."

Could any greater calamity befall New York than that it should be boycotted by the owners of trotting horses because the city had neglected to spend a few more millions for the trotters' exclusive benefit? Now, if it was the owners of automobiles—but why mention such intruders when one is dealing with the only thing which has any right at any time upon any road, the trotter?

* * *

I've great faith in the ability of the ground hog to foretell what the length of the winter is going to be. It is not necessary for me to explain why I have this faith, because you wouldn't understand it if I did. Suffice it to say that a week ago Monday the ground hog over in The Bronx came out of his cyclone cellar, looked around for his shadow, failed to see it and at once returned to his cellar, with the certainty that in six short weeks from that day spring will have sprung. Now you are warned, don't wait to order that new vehicle you've been thinking about buying, or, if you won't do that, send your old one to the factory and have it put in apple-pie order, because you'll need it, remember, in about only a month's time from when you read this.

* * *

Somehow it seems as if the more valuable experience the owner of a motor vehicle accumulates, the less energy and inclination he has to make use of it.

* * *

Should you chance to see any fashionably dressed gentleman proceeding on his way looking extremely miserable, though wrapped up in the heaviest of garments, don't pity him until you know what ails him. The chances are he is only experiencing an imaginary "motor chill." This is the very latest fashionable complaint, and was first introduced only last week by King Edward, who is said to have caught one from riding in an open motor car while wearing only a light overcoat. The result of Albert Edward's imprudence was a "motor chill," and so those in this country who look upon him as the arbiter of all fashion and elegance are now suffering from the same complaint, though in most cases the only motor car they have ever ridden in is the kind which has a bell at each end with a conductor and motorman in between.

* * *

When it comes to capturing a race like the one for the Gordon Bennett Cup promises to be this year, add a "p" to luck and you have the true secret of the winner's success.

* * *

I know a man who holds the responsible position of private secretary to a millionaire, and he tells me this: An inventor, who, by the bye, always wants it to be known that he is a "scientific discoverer," applied to the millionaire for aid to perfect and place upon the market an automobile which was to be something miles in advance of anything yet devised in the motor vehicle line. Now the millionaire was like most of his kind, an owner of several automobiles, and was the possessor of a very fair working knowledge of the construction of each of them, but when he came to read the specifications of the new scientific discovery he was asked to play angel for he could not make either head or tail thereof. As much as he could understand was that the chief claim was for a wonderful transmission which delivered 100 per cent of the power given to it by the motor. But even this claim was so obscured by the quasi-scientific terms employed by the "discoverer" in his description of it that the secretary was told to write the seeker after funds and ask him to be a little bit more explicit in his claims. Evidently the "discoverer" was not pleased, for his reply was that "the ultimate and persistent characteristic and potency of all the combined terms I have used in describing my grand discovery is pervasive reciprocal modification, without regard to specific affinities and influences superimposed upon their fundamental attitude and operation." This is where the case stands at the time this is written. What it all means no man knoweth, not even the "scientific discoverer" himself, I believe.

* * *

Get into an argument with a rabid motorphobe and you will find him absolutely without either reason or common sense when he is brought face to face with the unquestioned good points of a mechanically propelled vehicle. In him you will see the living evidence that no man is quite so obstinate as the man who knows he is in the wrong. The mule's kick is nothing but a protest against his family, but he can upset a belted earl if he is given a fair chance, and there's a deal of satisfaction in that.

* * *

In looking over the advertisements in a Sunday paper I ran across this one:

"Automobile leather and silk for the smart set; made any design. Automobile."

The vagueness of this excited my curiosity, so I wrote to the advertiser saying I had long wanted something of this very kind, but never knew where to get it until I had seen the advertisement, but as an evidence of good faith, and not necessarily for publication, I asked him to mail me a few particulars. When I had done this I forgot all about the thing. Coming home a few days later the servant informed me that the man had been there to measure me. I could not learn from her what man it was, nor what I was to be measured for. All she knew was that a man was bent on taking a measure of me. The next night a visitor came, and when he was shown in he deposited a pack the size of a load of hay on the floor, and before I could stop him had taken from it the wildest collection of alleged garments you ever saw. In a language which I suppose he thought was English he informed me that he was prepared to measure me there and then for any of the automobile garments I saw before me. I felt kind of sorry for the fellow because I really never meant him to be put to all the trouble he had, so I questioned him about his business, and he informed me that my reply was the only one he had received to his advertisement. I was not astonished at this, but as a sort of salve to my own conscience I wrote him an intelligent advertisement and inserted it at my own expense. THE COMMENTATOR.

NOW FOR CHICAGO'S SHOW

Most of the Exhibits Duplicates of Those at New York but Several New Western Cars Will be in Evidence, One at Least of Much Promise — Friction Drives a Conspicuous Feature — The Exhibitors, Their Wares and Locations.

Undoubtedly the Chicago show, which opens on Saturday next, will be a great function from the Western standpoint. From the Eastern point of view, and the viewpoint of the manufacturing trade, its glory and much of its interest have been dimmed by the New York show that went before, and it cannot, perforce, be "writ large," or at least as large as would otherwise be the case.

With few exceptions the cars and accessories that will be shown in the Coliseum are no longer new. Their every part and feature has been exhibited and is known and has been dilated on.

Of the exceptions few are large or important. Indeed, most of them are unknown or practically unknown, and are the product of Western concerns who, so to speak, will make their debut at Chicago. In all there will be fifty exhibitors at the Western show who were not represented at New York. Of the number but fifteen are manufacturers of cars, and of the remainder several are merely local or territorial agents.

Of the fifteen only the Woods Motor Vehicle Co., Friedman Automobile Co., St. Louis Motor Carriage Co., Fanning Mfg. Co. and the Buffalo Electric Vehicle Co. are of long establishment and are the only ones whose names and fame have penetrated far beyond their local confines. Of the others nearly all are of limited resource and capacity, and have yet to win their spurs. J. C. Brandes, with his German Cudell cars that did not arrive in time to be shown at New York, will be able for the first time to display and introduce them to the American public, and of the other newcomers the Wisconsin Wheel Works, of Racine, whose Mitchell bicycles and motor bicycles are known to fame, and who have a big factory and a plenitude of William Mitchell Lewis money behind them, is likely most deeply to impress those who go below mere appearances and who do not judge things from one car, a sign and a decoration of colored bunting. It is known that the Wisconsin people have something new not only in motor bicycles, but in the line of popular priced motor cars that promises to prove a revelation as to price, construction and appearance.

While to those who visited or digested the New York show, the Chicago affair will lack novelty, all of the cars that made the Eastern event notable will be in evidence for Western gaze and inspection. There is not more than one notable car absent. To mention them would be to call the roll of the entire trade, and if the magnificence and impressiveness of such an aggregation of touring cars does not quicken the Western pulse and heighten the demand for more than the popular priced runabouts, to which the Western folk have so strongly inclined, then the Western pulse—or pocket—must be in a bad way.

The attendance at the show also should prove in the nature of an index to the real extent of the West's awakening and interest in automobiles. It is regrettable, but it is nevertheless a fact, that none of the previous shows at Chicago attracted the numbers that were their due.

Viewed from this distance at this time, it cannot be said that, coming after New York, the Chicago show, whatever its influence locally and territorially, will add much, if anything, to the information of the trade or general public. The presence of three cars propelled by friction drives, the Friedman, the Union and the Swift-Marble, stand out as the most distinguishing feature of the show, and the one in which it differs most from New York. But the principle of the friction drive is not new, and the cars in question will interest chiefly because they are unlike the vast majority.

Excepting the Wisconsin Wheel Works car, which has never been seen or shown, it would seem that surprises or developments, if any are discoverable, must be sought for and dug out of the mass of smaller things that will be displayed by the thirty-odd exhibitors of parts, sundries and accessories whose wares were not displayed in New York.

The exhibitors who did not show at New York are as follows:

Spaces 17 and 18, Woods Motor Vehicle Co., Chicago—Woods electric vehicles.

Space 29, J. C. Brandes, New York—Cudell gasolene cars, made by Cudell & Co., Aix la Chapelle, Germany; motorettes, touring cars, delivery wagons and trucks.

Space 30, Fanning Mfg. Co., Chicago, Ill—Fanning electric vehicles, and also a new gasolene car.

Spaces 49 to 52, Ralph Temple & Austrian Co., Chicago, Ill.—Standard Motor Vehicle Co.'s line of Standard cars, embodying several new features.

Spaces 77 and 78, Friedman Automobile Co., Chicago—Friedman gasolene runabout, with friction drive.

Spaces 97 and 98, Eckhart Carriage Co., Auburn, Ind.—Gasolene cars.

Space 99, Marble-Swift Automobile Co., Chicago—Marble-Swift gasolene car, with a novel form of friction drive, employing two discs instead of one.

Spaces 101 to 103, Wisconsin Wheel Works, Racine Junction, Wis.—Mitchell motor bicycles and a new gasolene car.

Space 107, Pittsburg Reduction Co., Pittsburg, Pa.—Aluminum specialties.

Spaces 108 and 109, Jackson Automobile Co., Jackson, Mich.—Jaxon steam cars, having three cylinder engines of novel construction.

Space 111, Chelsea Mfg. Co., Chelsea, Mich.—Chelsea cars.

Spaces 116 and 117—Louis M. Grant, Chicago.

Spaces 118 and 119, Columbus Motor Vehicle Co., Columbus, O.—Columbus gasolene cars.

Space 137, Briscoe Mfg. Co., Detroit, Mich.

Space 143, Carl Fisher, Indianapolis, Ind.—Storm aprons, etc.

Spaces 146 and 147, K. Franklin Peterson, Chicago—Cleveland-Canton Spring Co., Canton, O., springs.

Spaces 148 to 151, P. J. Dasey & Co., Chisago—Western Motor Co., Logansport, Ind., Rutenber gasolene motors.

Space 152, Brecht Automobile Co., St. Louis, Mo.—Running gears and automobile parts of all kinds.

Space 160, H. W. Johns-Manville Co., New York—Asbestos specialties.

Space 165, Pope-Robinson Co., Hyde Park, Mass.—Pope-Robinson gasolene cars.

Space 177, H. B. Wick & Co., Youngstown, Ohio—Wick gasolene cars.

Space 181, Searchmont Automobile Co., Philadelphia, Pa.—Searchmont gasolene cars.

Spaces 183 and 184, American Darracq Automobile Co., New York—Darracq gasolene cars.

Space 189, E. J. Willis, New York—Motors and parts and Herz spark plugs.

Space 190, Motsinger Device Mfg. Co., Pendleton, Ind.—Auto-sparkers.

Space 191, Sandusky Automobile Co., Sandusky, Ohio—Sandusky gasolene cars.

Space 192, A. H. Funke, New York—Kelecom motors, Autolyte lamps, horns and spark plugs.

Good Roads on a Great Scale.

Arrangements have been practically completed for the Good Roads convention which will be held at Chicago on February 20. The preparations are on a most extensive scale. The immense Auditorium has been engaged, and 20,000 people are expected to attend. Invitations for seats on the platform have been sent to 2,000 people, among them being nearly everybody of prominence politically or officially in the country. Beginning with President Roosevelt, the list goes down through Congressmen, State legislators, municipal officials, editors, railway officials, etc. The list of invited speakers includes Congressman Brownlow, of Tennessee, introducer of the Brownlow Good Roads bill; Secretary Leslie M. Shaw, Senators M. A. Hanna and Chauncey M. Depew, General Nelson A. Miles, Sir Wilfrid Laurier, the Canadian Premier; President W. H. Moore of the Good Roads Association and Colonel Albert A. Pope.

AN AUTOMOBILE AIR SLED

Not an Irridescent Dream But a Craft That Really Motes and Totes.

It has been the subject of quip and jest and has been joked about in the comic papers ever since the donkey cart began to be held up for a laugh as a "horseless carriage," but it is actually here at last—the ice automobile

It is not the dream of a demented garret inventor either, but a very practical contrivance based upon sound scientific principles, and mechanically well constructed. It is something that really promises a solution to the problem of transportation in the Frozen North.

It does not travel upon wheels, but, like an iceboat, goes upon runners. It is driven, like an airship, by a screw propellor, beating against the air, and this in turn is operated by chain and sprocket transmission of power from a De Dion motor, like an everyday, respectable automobile.

Hearing of the combination of such things as airship, iceboat and automobile, one would naturally be led to expect a foolish "freak," but this new vehicle seems to have all the essential qualities of a successful invention for practical use. It goes and it carries passengers. Only one model has been made, but this has carried three full grown men at the rate of fifteen miles an hour about a lake with only a 2¾ horsepower motor.

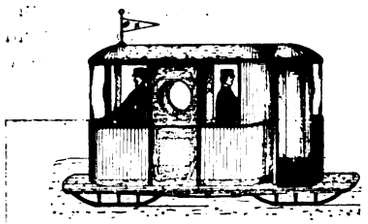
The combination creation is the product of J. B. Macduff, a staid, middleaged Scotchman, who has invented various successful machines and is now in the real estate business in Brooklyn. It was an idea worked out in his leisure time. He is not filled with big ideas about it, and patents were not taken out until it was found that it would actually "mote" and some of the possibilities of it were conceived. After it had been tried and proven Mr. Macduff christened it the "pneumoslito," meaning air sled, slito being the German term for sled.

The original model was a little triangular affair, with two propellors run by an electric motor. The trial horse, so to speak, is a car that has a platform twelve feet long by four feet wide, one propellor four feet in diameter and a 2¾ horse-power De Dion motor. This was built for Mr. Macduff by A. K. Schaap, in his automobile repair shop at 1,740 Fulton-st., Brooklyn, and was completed only a couple of weeks ago. A general view of it is shown in the accompanying cut made from a photograph of it taken while it was in use on the ice of a lake at Ridgewood, L. I. The floor of the body is made of stout wooden slat work, and a narrow plank seat runs from the motor and propellor to the front end, where the steersman sits astride the plank and guides the craft by means of an ordinary pair of bicycle handlebars. The flooring is mounted upon four big wooden skates, with steel blades in them, and the front pair are constructed so as to respond to the steering gear independently of the body. Levers for the sparking, the mixer and the clutch are within reach of the steersman, who sits with his legs protected behind a wind shield, shaped like a plough. The propellor is mounted in a frame above the motor, and is connected by a chain and sprocket gearing, geared one to three. The four blades of the propellor are rimmed at the periphery by a flat band of their own width, which is riveted to the blades, and revolves with them. This outer rim and the shape of the blades or pitch of the screw are the vital features of the construction, and hold the secret of the successful operation of the machine. According to the inventor the construction prevents the waste of any particle of air, every bit of atmosphere which comes in contact with the propellor being utilized for propulsion.

In getting under way the motor is started at slow speed, and the clutch thrown in. The propellor begins to revolve slowly, and gradually gains headway. When it has attained a certain velocity of revolution the pneumoslito starts slowly, and it gains headway as the propellor does, until the maximum velocity of revolution has been reached, which in the case of this trial machine is 500 revolutions per minute. It is impossible to start the craft with a jerk, and if the motor is simply stopped the vehicle will come to a stop gradually and gently. A brake is provided, however, that enables the operator to bring the car to a stop in a very short distance.

Mr. Schaap, when he built the machine to specifications, was frankly sceptical as to its ever being able to move itself, but he has ridden on it since then, and he now talks about it more enthusiastically than the inventor himself. He says that when it was tried on the lake at Ridgewood it seemed to make no difference whatever whether there were two or three or half a dozen persons on it. It was run at the rate of about fifteen miles an hour, and it is the opinion of Mr. Schaap that twenty miles an hour can be attained with it. When asked about running against the wind or crossways to it, Mr. Schaap remarked:

"Now that is one of the many pecuriar thing about the affair, and there are a lot of queer phases to it. It seems to run just about as fast across or into the wind as against it, but when it goes into the wind the number of revolutions increase, and the motor runs faster. Another odd thing is that the propellor does not draw the air through it, but seems to cut it out in chunks and hurl it backward from it."



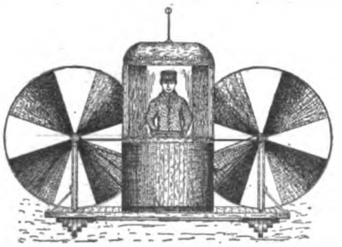
The latter remark was demonstrated to a Motor World man by setting the motor and propellor in motion as the machine stood on the floor. Behind the propellor there was a strong but fitful draught, as if the air truly was being thrown backward in lumps, but on the forward side of it there was no perceptible suction.

The Motor World man found Mr. Macduff busy with his real estate affairs, at 1,367 Broadway, Brooklyn. He is a quiet, untalkative man, seemingly wanting in enthusiasm. He was asked what he proposed to do with his "air-sled," and replied:

"Well, if I get time, I would like to take it up on the Hudson, where I could try it for a mile straightaway. If I don't do this I will take it up to Lake Hopatcong, where I have a place, and run it on the ice there. This is a very crude affair, though, and I

Digitized by Google

have designs drawn for two others, with steel propellor blades, one with an eight horse-power motor and another with two big motors and two propellors. This model has wooden screw blades, metal bound, or armored, as you might say. The pitch is about right, though, and the rim works just as it should, economizing every bit of air. If Stevens had a propellor like that on his airship it would work differently. That propellor will do three or four times the work that any of those used on any air-

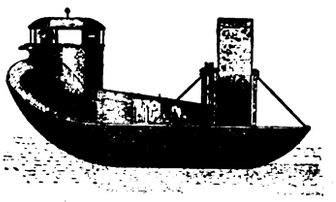


AS A CAR—SIDE-VIEW.

ship yet made will do. All my ideas are not worked out in this machine though. Surprised to find that it would run, were you? Well, I suppose that it because it is new to you. There is no reason why it shouldn't run. I knew it would as soon as I had time to have one built. No, I never built anything in the airship line before, but that can be done, now that motors have been so well developed. I have made a number of inventions in machinery, and this is an idea I have had for a long time. Those other drawings, of the boat and the car are just different adaptations of the idea, but I haven't had them built yet."

"What do you propose to do, just make them for pleasure purposes, the same as iceboats?"

"They are good enough for pleasure, but there is a more practical side to them. I am investigating the conditions of travel up north, where there are seas of ice all the year around. There is the Yukon River frozen solid eight months in the year. There is no reason why the pneumoslito should not be introduced and made to revolutionize travel in countries of that sort. They will haul passengers and freight in a couple of



FRONT VIEW.

hours further than dogs can take them on sleds in a day's journey. As I have said, I am investigating the conditions of travel in the icebound regions, to see what the difficulties are and what facilities there are for craft of this sort. There are thousands of miles of frozen rivers and lakes in the north we know, and lines of travel now closed could be opened and maintained over tracks made ready by Nature, connecting many cities and towns by air-sled rapid transit."

"Will it travel against a stiff wind?"

"Well, you have seen how the air slides through it in front. Propellors run by ten horse-power motors would run at 1,200 revolutions a minute, and that is hurricane velocity. The air would have to be travelling faster than it does in a hurricane not to be caught and used by the propellors. The only trouble going against the wind will be the resistance offered by the body of the car and the passengers. The propellor offers no resistance, and there is almost a total absence of friction in running over ice. With the car built low and shaped to cut the wind there will be very little holding back by the wind."

"Why don't you organize a company to

AS A BOAT.

built them for practical purposes of transportation, as you suggest?"

"Well, I haven't got that far along yet. I haven't given much time to the matter, but all that will come in time."

The accompanying cuts show a side view of the car mentioned, with the propellors at the rear, a front view of the same and a side elevation of the boat, designed to be used in conjunction with the car in the open seas of the polar regions. In the photographic cut the propellor is running, and the machine is just getting under headway, and it will be seen by the way the overcoat of on the man in the rear is blowing that the sled is moving obliquely in the wind.

Sintz to Enlarge.

Plans are on foot to greatly extend the operations of the Sintz Gas Engine Co., which was removed from Grand Rapids to Detroit about a year ago. To carry out the plans the present capital stock of $65,000 will be increased and other Detroit capitalists interested. At the annual election of the company, recently held, Directors E. E. Barber and James Bayne, of Grand Rapids, who were active in the company before its removal, retired. Ora J. Mulford was succeeded as secretary by E. B. Finch.

Trying to Organize in Scranton.

Efforts are being made to organize an automobile company at Scranton, Pa. J. H. Brooks, A. P. Bedford, C. M. Florey and others are interested in the movement, the purpose being to conduct a general automobile business. The intention is to have a salesroom, livery and repair shop, and ultimately to possibly engage in the manufacture of automobiles.

Making an Effort in Attleboro.

Efforts are being made to organize a company at North Attleboro for the manufacture of gasolene automobiles. Capitalists in Providence, Pawtucket and Attleboro are said to be interested in the project. The factory may be located at Plainville, which is two miles from North Attleboro.

Raised Duty on Clement.

Reappraisements have been made on a number of the machines that were brought into the country at the time of the show and passed hurriedly through the Custom House. A. Clement is one the principal victims of the readjustment. One of the Clement 16-horsepower machines that was entered at 10,300 francs was advanced in value by Appraiser Whitehead to 11,200 francs, and this has been sustained by the Board of General Appraisers. There were similar advances on other machines, the total of increase in assessments amounting to $531.

Nelson Incorporates in Iowa

Among recent newcomers in the manufacturing field is the Nelson Gas Engine and Automobile Co. of Harlan, Iowa. Articles of incorporation for this concern, with a capital of $50,000, have just been filed with the Iowa Secretary of State.

Banker Leases a Building.

Largely increased facilities have been secured by A. C. Banker, the Chicago dealer. He has leased the six story and basement building at Nos. 456 to 460 Wabash avenue, and will hereafter use it for his entire business.

Toledo and Conrad cars will hereafter be handled by the H. J. Koehler Sporting Goods Co., Newark, N. J.

One More in Cleveland.

The Star Automobile Mfg. Co. is a recent addition to the number of Cleveland, Ohio, manufacturing concerns. It has just leased property at No. 184 Kinsman street. There it will build the Star gasolene car, an 8 horsepower single cylinder horizontal engine. The officers are H. H. Hodell, president; James A. Matthews, vice-president; W. A. Dutton, secretary and treasurer; G. R. Albaugh, superintendent, and J. H. Van Dorn and F. Schneider, directors.

New Station in Buffalo.

An automobile station has been opened at No. 59 Franklin street, Buffalo, N. Y., by the Centaur Motor Vehicle Co., of that city. A general agency business will be conducted, and all types of cars will be looked after. The station is entirely separate from the company's manufacturing department. Cadillac and Yale cars will be sold, and perhaps several other lines.

Indianapolis Show Abandoned.

Indianapolis dealers having been unable to find a suitable building in which to hold an automobile show, the project has been abandoned. The Fischer Automobile Co. will, however, hold a show of their own. Their new establishment, in North Illinois street, will be completed next month, and April 1 has been set for an elaborate opening.

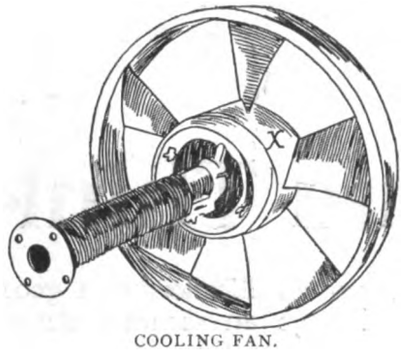
MERCEDES FEATURES

Despite Effort at Secrecy Some Details Leak out but They are not Strikingly Novel.

Profound secrecy has hitherto been preserved regarding the new Mercedes cars. The automobile world has been all agog over them, and rumors of various kinds have been circulated. Would they this year, as they did last, come forward with new features worthy of being extensively copied?

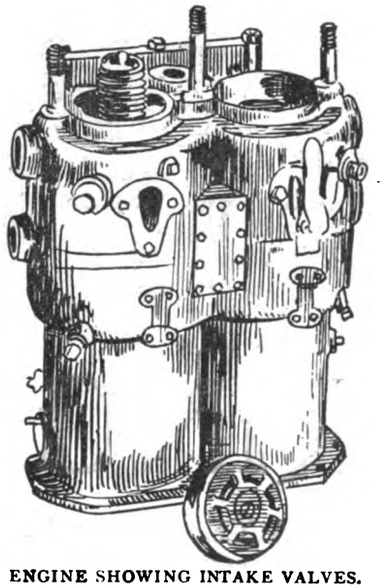


From the Allgemeine Automobil Zeitung comes the first illustrated details that can by any means be regarded as authentic. They are meagre enough, and touch on only a few features. As far as these go—with the exception of the readily removable intake valves—there is nothing revolutionary or even particularly startling in them.

Two models, i. e., a 60 and an 18 horsepower, are receiving much attention. In both the engine is of the four cylinder type, cast in pairs. A noticeable alteration is the placing of the inlet valves directly in the centre of the cylinder head. The valves are of unusually large size, as will be seen by a glance at Fig. 1, in which the valve in one cylinder is shown in place, while that of the other is lying on the ground. The inlet valves are mechanically operated, but the actual details of the arrangement adopted have not yet been made public. The placing of the inlet valvet in a central position is claimed not only to concentrate the force of the explosion on the piston, but leaves one side of the cylinder free for the magneto-ignition gear.

A new carburetter is being adopted; this is smaller than the 1902 pattern, and, while giving a perfect mixture, allows the motor to be run at even a slower speed than last year's type. Owing to the patents not yet being secured, no information with regard to its construction can as yet be given.

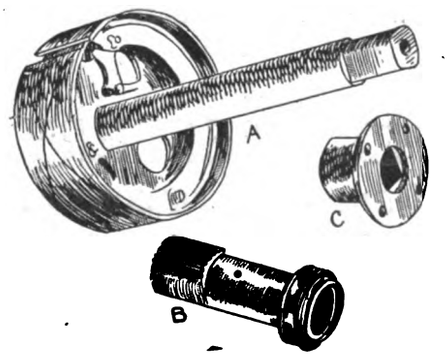
Passing now to the transmission mechanism, the clutch has been entirely remodelled. Figs. 2 and 3 show the arrangement so clearly that little description is necessary. The flywheel, it will be noticed, is still made in the form of a fan, while the clutch is of the expanding segment type. As the sleeve on which the male cone is mounted is pushed forward by means of the clutch pedal it is at the same time, by the action of spiral guides, given a rotary motion, this being conveyed through the toothed segments to the clutch, which is thus expanded or contracted as desired.



It is the intention of the Cannstatt concern to build a number of racing Mercedes cars. These will have four cylinder engines, developing 80 horsepower at a speed of from 1,000 to 1,200 revolutions a minute, the diameter of the cylinders being 177 millimetres by 150 millimetres stroke. The capacity of the cylinders in the 40 horsepower car is 1,640 cubic centimetres, in the 1903 60 horsepower car it is 2,052 cubic centimetres, and in the 80 horsepower racers 3,404 cubic centimetres; it will thus be seen that the motor of the new racer has a capacity of more than

COOLING FAN.

double that of last year's 40 horsepower vehicle.



The weight of the frame, springs and axles has been further reduced, and at the same time the strength and rigidity of the same

ENGINE SHOWING INTAKE VALVES.

have been increased. The cooling surface of the radiator has been doubled by a new method of arranging the tubes without increasing the volume.

The 60 horsepower car will have four cylinders, the diameter being 140 millimetres by 150 millimetres, as compared with the 118 millimetre by 150 millimetre cylinders of the 1902 40 horsepower engine. In addition to the 60-horsepower car already referred to, an 18 horsepower vehicle is being introduced for the 1903 season; it will be fitted with a four cylinder engine, developing from 18 to 25 horsepower, the car, complete with tonneau body, weighing 750 to 800 kilos.

CLUTCH.

The frame will be, as in 1902, of the pressed steel type. The axles undergo a change, being T shaped instead of round. In view of the demand for Mercedes cars the Cannstatt company are making preparations for considerably increasing their output, and instead of building fifteen cars a month, as at present, they will soon be able to turn out forty.

Carburetters in Cold Weather.

If any difficulty is experienced with the carburetter during raw weather it will probably be remedied by bringing it closer up to the engine. In cases where it is placed at some distance away and low down a draught of a heavily laden moist atmosphere is drawn into the carburetter, and on its passage to the cylinder becomes dried to some extent and thus gets rid of the moisture contained in the air. This moisture, in the form of water, drops to the bottom of the carburetter, and in a short time accumulates sufficiently to interfere seriously with its working.

If the gasolene tank can be raised to a position high enough to feed the spirit by gravity to the carburetter a great advantage will be gained by shortening the pipe so as to bring the carburetter nearer to the heads of the cylinder, where, by the heat given off, the air becomes drier and more capable of taking up the spirit than a damp atmosphere. In making any conversion of this description it is always well to have all necessary curves made as broad as possible, avoiding all short bends, whereby the induction power of the motor is decreased, thus considerably affecting the power of the carburetter when of the jet spray type.

Morgan Talks Motor Trucks.

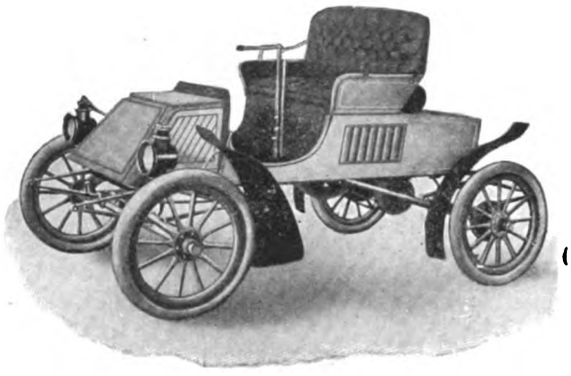
At Worcester, Mass., last week the Success Club of the Y. M. C. A. enjoyed a talk on motor vehicles. The speaker was Ralph Morgan, of the Morgan Motor Co., who confined his remarks to heavy vehicles for trucking purposes. He was listened to with close attention, and at the close the members of the club asked many questions regarding constructional details.

Waverley Touring Car Coming.

It is understood that the International Motor Car Co. is about to place on the market an electric tonneau car. It was not completed in time for the shows, but will make its appearance in a few weeks.

Wells no Longer With Prescott.

H. M. Wells is no longer with the Prescott Motor Carriage Co. He severed his connection with the Passaic concern several weeks ago.



The Pioneer Automobile Co. will occupy the entire four floors of the building at No. 54 West Thirty-eighth street, this city.

ROAD RACING RIVIVAL

Long Island Automobile Club Plans a One Hundred Mile Event.

Although the accident of last year at the speed trials on Staten Island put a blight upon road racing for the rest of 1902, there is no reason why it should continue to do so. Railed locomotives run amuck and slay hundreds, jockeys are killed on the horse tracks, the trolley and the truck claim their victims regularly in greater number than the automobile, as has been shown by statistics in the Motor World. One unfortunate accident oes not pressage any more, but rather guarantees greater precaution against them. The straightaway road test is the natural and eminently the fittest one for an automobile. The highway is its province, and the track is not.

Automobilists have not tried to get permission for road races since last May, but there is no reason why they should not do so and why the permission should not be granted. Road races are almost necessary in the development of this now most important industry. The great interest taken in them is evident from the manner in which European contests are watched. It is a rebuke to the American spirit of progress and liberality that all the contests of this sort should be held on the other side of the Atlantic.

Considering these things, it is good news that the Long Island Automobile Club is planning a road race for the spring. The news of this was learned by a Motor World man in a telephone conversation with one of the officials of the club, the tenor of which was in this wise:

"It's getting along toward April. Is the Long Island Club going to have any reliability run this spring?"

"Oh, no! Reliability runs are out of fashion now, you know. There will be something else doing this spring, though."

"What is that, a race meet?"

"Something of the sort."

"Where, at the Brighton track?"

"O, dear, no—on the road, I guess."

"On the road! On Long Island?"

"Yes."

"What distance?"

"One hundred miles—the course will probably be one of fifty miles, with a turn."

"Is that settled?"

"Well, we are working on it now—working to get the permission, that is—and it looks very hopeful at present."

Street Sprinkling Reform Likely.

According to the latest gossip from the statesmen of the New York City Hall, there will be no attempt made by the Board of Aldermen to pass the Marks sprinkling ordinance over the veto of Mayor Low. It is deemed more probable that the ordinance will be amended or a substitute introduced conforming to the ideas of the Mayor, which are in a line with the provisions of the Oatman ordinance placing the sprinkling in charge of the Department of Street Cleaning.

The difficulty is that to make the desired change a new bond issue for about $500,000 will be necessary, and the present administration does not want to increase the tax rate by doing so this year. In the mean time there is no provision for sprinkling the city after next May, but this probably will be provided for by a bill authorizing the Street Cleaning Department to make contracts for the work for one year only, so that next year a bill putting the whole matter in the hands of the Commissioner can be again introduced. An effort will be made, however, to overcome the objections to making a bond issue and to take the Oatman ordinance out of committee and have it passed.

TO DOWN THE DUST

Test for That Purpose Suggested—Factors in Creating Discomfort on the Road.

It has been suggested by English autoists that a series of trials with seven or eight cars for the purpose of thoroughly investigating the dust nuisance would be of great interest, and possibly add to the sum of knowledge upon the subject. It is pretty generally recognized that a very low built car, any serious deviation from truth in the tires or wheels, a bent frame which causes the wheels to drag, very large tires and an exhaust which beats upon the ground are all causes which add to the raising of dust, but it is equally certain that a car which possesses none of these particular features will also raise a great deal of dust.

If a small car is taken which possesses one or more of the dust raising properties it may, in an extreme case, make almost as much dust as a large car, but speaking of the average, there is no doubt whatever that the larger and faster the car the greater will be the dust cloud.

There appears a tendency in some quarters to infer that the small machines are worse than the large ones. This, unfortunately, is not the case.

In some respects these suffer more than any other users of the road, as they may be running at five-eighths the speed of the fast car which overtakes and passes them, and the consequence is they remain in its dust very much longer than slower moving traffic. In fact, it is a common thing to see the owners of the lower paced vehicles slackening down to walking speed for a quarter of a mile after being passed by one of the dust lifting monsters, so as to get out of its track as soon as possible.

LOOK TO THE GEAR!

Why They Require Occasion Inspection and the Sort of Attention They Merit.

Speed change gears are a part of the car that should be looked after intelligently. An inspection will show whether this has been done. The teeth of the wheels should show a brightly burnished surface on the faces, but not necessarily on the tops and bottoms. By "faces" is meant the breadth of the teeth which engage with the opposite wheel. If they show as brightly here as they do on the faces they have been intermeshed too deeply in the first place, and there is lively to be excessive wear. If they show dark or lightly touched surfaces, they have been correctly set, and they should be in good running order; in fact, they will probably be better than new. Each of the wheels should be looked at all the way round to ascertain that no teeth are broken.

If the sliding type of gear—that is, a type where the wheels are slid into engagement sidewise—be in the car under notice, the edges of the teeth should be looked to. If the car has been in good hands the teeth will show brightly on their engaging sides; but if the driver has been at all clumsy it will probably be found that the teeth are badly chipped at these points. The speed changing movements should all be closely watched while manipulating the actuating lever. The wheels on the sliding sleeve should move deliberately and accurately into their corresponding wheel—that is, provided the teeth are not opposite one another. The edges of the wheels should be in a perfect line, not one overhanging the other; if this is the case, it indicates a lot of lost motion in the connections between the sleeves and the actuating lever.

A certain amount of latitude is permissible here, but the movement should not be more than what might be termed "a little free." If there is a lot of "backlash" there is something wrong somewhere, and it should be carefully looked for with a view to correction. If the total width of one wheel exceeds that of the other, as is sometimes the case, particularly with the reversing gear, then it does not follow that something must necessarily be wrong.

Effect of Oil on Rubber.

Much has been said about the injurious effect of oil on rubber, and fears have been expressed that oiled roads would ruin the tires of automobiles that pass over them. It is, however, only certain classes of oils that are deleterious, and mineral oils are not among the number. A German rubber expert found that all the effect that mineral oil had on a vulcanized rubber made from 90 per cent. pure Para and 10 of sulphur was to cause it to swell to such a small extent that after five days' complete constant immersion it had only increased about 42 per cent.; in other words, a cubic inch had swollen to one and two-fifths cubic inches. This was, however, the mere interposition of the particles of oil in the pores of the crude rubber, and which, no doubt, could easily be expelled through squeezing it.

It is quite a different matter, however, as regards rancid animal and vegetable oils and fats, which act very energetically and deleteriously on rubber. Even linseed oil, by inducing oxidation, causes rubber to resinify.

Columbia Institutes a Course.

After repeated rumors to the effect that Columbia University is to have an automobile course have been circulated and denied, it is now officially admitted that such a course is to be introduced in the near future. The course will be designated as that of "Traction Engines and Automobile Carriages." It will consist of three lectures a week delivered by Professor Frederick R. Hutton, dean of the School of Applied Science. The lectures will deal with rolling stock, self-propelling road engines, railway engines and automobiles of all sorts.

Among the special subjects to be treated are signal systems, bell, whistle and headlight, capacities and structure, effect as limitations on power or haul, drawbars and couplers, water stations and motors other than steam.

The course will begin with an estimated enrolment of thirty students. If the attendance justifies it the course will be extended next year.

Keeping Down Repair Bills.

Repair bills are usually a pretty good index to the care and intelligence bestowed upon a car. It is the first duty to learn how to keep down expenses. When the multiplicity of parts that are in a car are considered, you can readily understand that when one part (which is always connected to another part) becomes loose or shaky that it in turn will loosen or destroy the accurate working of another part, which in turn will make a bad working engine or machine. Every part should be gone over at least once a day to see that everything is tight or properly adjusted, for the reason that when a looseness is discovered and remedied immediately it has saved a repair bill. If you fail to do this you must expect to pay your repair man more than necessary to keep your automobile in proper repair, and the repairsman is not to blame for it.

Helps get the Explosion.

In starting a car after a cold night it should be remembered that every ineffectual turn of the crank does some good. The congealed oil causes the engine to respond slowly, but a few turns warms it sufficiently to enable the welcome explosion to come finally.

DELIVERIES FREER

Cars now Coming Through in Good Shape—New York Stores Able to Meet Calls.

Stocks, ready for immediate delivery, are in somewhat better supply in New York City now from what they were a few weeks ago. Especially is this true with regard to imported cars. The new Mors cars can be had promptly from the Central Automobile Co., of No. 1,684 Broadway; Barry & Hayes, of No. 33 East Fifty-eighth street, have half a dozen of the new Georges Richard cars nearly free of the Custom House formalities; the American Darracq Co., of No. 652 Hudson street, have a shipment due in a few days, while Smith & Mabley have Panhards ready for the road at short notice.

No new Wintons can be kept on hand by Manager Owen at the Winton branch in East Fifty-eighth street, but shipments are being made regularly from the factory. At the Banker Bros.' handsome place at No. 141 West Thirty-eighth street there are a dozen of the new model Peerless cars ready to be taken right away by the purchaser, though the stock has been reduced by the sale of eight cars within the last few days. One of the buyers of the 35 horsepower 1903 Peerless is Milo M. Belding, jr., of the silk trust, who ran a 1902 car last year. The demand for Oldsmobiles is as steady as a rainfall in the store at No. 138 West Thirty-eighth street, but prompt shipments are being made. Homan & Schulz, at No. 134 West Thirty-eighth street, are having a brisk demand for the rugged Northern runabout, but manage to make prompt deliveries. The demand for the gas Locomobiles is crowding the factory to its utmost, but the capacity of this big plant is elastic. Ramblers are coming along in good shape to the Wanamaker store, as are also Searchmonts and so on. Without enumeration, it may be said that at present there is a goodly number of the New York branches ready to make immediate or very prompt deliveries, but the demand is quickening, and those who want cars for use in the early spring will be unwise to be dilatory in placing their orders.

Echo of the Bubble-Burst.

An echo of that gigantic fiasco known as the International Power Co. was heard last week. Deputy Sheriff Campbell, of this city, received an attachment for $39,350 against the Pioneer Power Co. of London in favor of Walter H. Knight, of New York, on assigned claims for ten electric vans, one victoria, two broughams and one omnibus, sold to the company on May 16 last by Joseph H. Hoadley for $27,350, and for three steam auto-trucks sold to the company by the International Power Co. for $12,000, no part of which has been paid. The attachment was served on C. S. Drummond, a director of the Pioneer Power Co., and on Mr. Hoadley.

HARKNESS IN PARIS-MADRID

Cabled his Entry This Week—His Specially-Built Car Rapidly Nearing Completion.

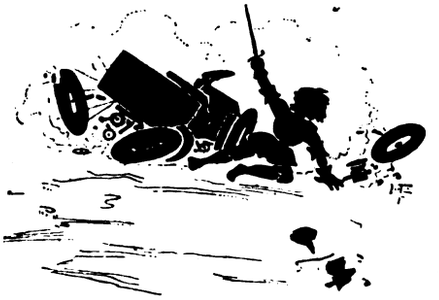
It is evident that H. S. Harkness, of New York, expects to have his new cup race car finished in ample time for the contest, should he be selected by the committee, for he has cabled to France his entry for the Paris-Madrid race of May 24. Mr. Harkness bids fair to become one of the foremost of this country's automobile racing enthusiasts. He made his debut in the sport at Brighton Beach last August, where he drove his 40-horsepower Mercedes to victory in several races. He is now having built a car of special pattern designed by himself.

With the possible exception of Barney Oldfield, no man ever came more quickly to the front as a daring and skilful chauffeur than Harkness. Until the Brighton Beach meeting last August he was entirely unknown.

In common with many other drivers of this kind—Fournier and W. K. Vanderbilt being notable examples—Harkness runs his car in a manner that seems to be reckless and even careless. Yet accidents almost never happen to such men. They take chances, but only when there is a margin of safety, and then it is their marvellous manipulation of their cars that brings them through in safety. Nothing escapes them and every move is carefully calculated.

"Sporty blood" runs in the Harkness veins. Harkness senior is a Standard Oil magnate, who views his son's proclivities with a partial eye. The junior has followed many branches of sport, among them, some years ago, being bicycle racing, he having had quite a career on the track. He has thrown himself into automobile racing with the enthusiasm that characterizes him, and is very much in earnest in his desire to contest for the Bennett cup.

Racing and Talk of Racing.



There is considerable talk of racing in the air, and prospects for a lively season in this respect. Messrs. Fournier and Winton started the big racing talk, but these worthies are not to have the field to themselves by any manner of means. The idea very properly has got into the heads of a number of manufacturers that racing their cars will be a good thing, and, while no one at present cares to speak definitely of his plans, it is expected that most of the new concerns, such as the Moyea, Matheson, Panam, and also several of the older makers, will be to the front with racing machines.

It is known that the Peerless people are having built a duplicate of the car that has been entered for the cup race—and, by the by, this will be of about 80 horsepower—and that this car will be on hand ready to get into anything there is going in the way of a race meet. This duplicate car will be delivered in New York in about a month to Manager C. J. Wridgway, of the Banker Bros.' store, and will be kept there, stripped to racing form, "just to run errands," as Manager Wridgway puts it. "Wally" Owen, of the Moyea company, is another who is likely to be seen on the racing track during the year. John Wilkinson, of Syracuse, is another who promises to break into the game with a special racing car, which he says he will be willing to back against Fournier, Winton, Jarrott or any of them. In fact, it looks as if there would be plenty of material to justify the formation of a racing circuit.

To Philadelphia, not Lakewood.

Owing to the probability of the run to Lakewood and back, as projected by the Automobile Club for February 21-23, leading through a sea of red New Jersey mud, the programme for the first outing of the year has been changed by the Tours and Runs Committee of the club. It was learned that from Old Bridge to Lakewood, a distance of about thirty-five miles, there is a stretch of road which after a thaw breaks up into a bog of red mud, deep and heavy enough to mire the lighter class of automobiles. It was thought discreet, therefore, not to take chances on the weather and run the risk of having the trip spoiled by mishaps in the mud.

The destination for the first run has accordingly been changed from Lakewood to Philadelphia. The trip from New York will be an informal one, each participant starting when he pleases and going by any route he prefers. The route suggested by the committee, though, and the one likely to be taken by most of the members, is by way of the Twenty-third street ferry to the Hudson County Boulevard, then to Bergen Point, across the ferry to Staten Island, along to Tottenville, and by ferry back to New Jersey again at Perth Amboy, and then through New Brunswick and Trenton to Camden and Philadelphia. The participants will rendezvous at the Bellevue Hotel on Saturday night, where a banquet will be served. Sunday will be spent in trips about the city, and the run to New York will begin on Monday morning. The run will have a pacemaker, and arrangements are to be made by which the members will be spared annoyance from the police on account of the new license law of the Quaker City.

HIS KINGDOM FOR A HORSE.

RIFLES FOR "RED DEVILS"

Connecticut Legislator Waxes Wroth at a Meeting Called to Consider his Be-Gosh Bill.

It is peculiarly appropriate that Representative Warren, the introducer of the bill in the Connecticut legislature restricting the use of the automobile, places himself on record in the matter. He declared last week that it might be a "good idea to use a rifle in some instances to bring the Red Devils down to a proper speed."

His remarks, which were made in the Hartford Capitol at a meeting of about sixty of the "farmer" members of the legislature, met with general approval, according to the Hartford Post.

The meeting was held to discuss in an informal manner the advisability of having the law in regard to the speed limit on country roads amended so as to give greater protection to farmers and their teams. It was enlivened by very general remarks on the part of the members present regarding the recklessness of drivers of automobiles in running them at a high rate of speed. The indifference of the automobilist was generally condemned, and Representative Warren, of Lyme, who has introduced a bill in the House for licensing and regulating the speed of automobiles, suggested that each machine be numbered on the rear as a means of identifying it in case of any damage being caused by horses becoming frightened or other accident happening through the high rate of speed at which they were run. He remarked that it might be a good idea to use a rifle in some instances to bring the "Red Devils" down to a proper speed. His remarks met with general approval.

A committee of four Representatives was appointed by Representative Bowen, of Woodstock, who presided, to formulate a bill on the matter and to take under consideration any other matters of interest which may come before the General Assembly.

The following is the committee appointed: Representatives Savage, of Mansfield; Staub, of New Milford; Case, of Barkhamsted, and Warren, of Lyme.

Sixty Within the Hour.

Speeds at the rate of more than a mile a minute have frequently been reached on an automobile, the mile of M. Augueries being but slightly under ninety miles an hour. Until last summer, however, sixty miles within an hour had not been accomplished—at least not over a measured course and with unimpeachable timing. In the Ardennes circuit race Baron Pierre de Crawhez accomplished the feat, although he failed to finish the race.

SENSIBLE LAW IN JERSEY

A Substitute Introduced for the Scovel Bill That Seems Fairer All Around.

Bowing to the storm of protests raised on the presentation of his automobile measure in the New Jersey legislature, Representative Scovel, of Camden, is willing to compromise the matter. At a meeting held on Monday a new bill was roughly blocked out and will shortly be introduced. It will contain a registration clause and a clause requiring autoists to stop on signal. In other respects it is an admirable measure, calling for speeds of ten miles in the towns and twenty miles in the country. It appears to be satisfactory to all concerned, and sure of passage.

The conference was held on Monday night, when Representative Scovell met Karl G. Roebling and John S. Broughton, representing the New Jersey Automobile Club. The result of the conference was practically an agreement to have the committee which now has the custody of the Scovel bill report a substitute which will afford ample protection to the users of the public highways and not work hardship to the automobilists.

On public highways in the built up portions of cities the rate of speed is not to exceed ten miles an hour, and in rural districts the maximum rate of speed is to be twenty miles an hour. Physicians and surgeons, while actually going to or returning from professional calls, are not to be restricted to this speed when the emergency may require them to go at a faster rate.

Under the projected law every operator of a motor vehicle shall, at the signal from a person riding or driving a restive horse or team, cause the motor to remain stationary so long as may be necessary to permit the team to pass.

It is provided that the term "motor vehicle" shall include automobiles and all other vehicles propelled otherwise than by muscular power, excepting the cars of electric and steam railways and other vehicles running only upon rails. Bicycles, tricycles and other vehicles propelled exclusively by muscular pedal power are specifically excluded.

Every resident of the State who owns a motor vehicle, and every non-resident owner whose motor vehicle is driven in the State, shall file in the office of the Secretary of State a statement containing the owner's name and address, together with a brief description of the character of the machine, and shall pay a registration fee of $1 for each vehicle. In return a certificate will be issued by the Secretary of State for each vehicle.

Besides this certificate the owner must have the initials of his name and the number of his license upon the back or side of each vehicle, so as to be plainly visible, the letters to be at least three inches in height and the number to be not less than two inches in height. Every motor vehicle will be required to carry from one hour after sunset until one hour before sunrise at least two white lights, visible at least 200 feet in front and at least one red light, visible from the rear. Every vehicle must also be provided with good brakes and suitable bell, horn or whistle.

By complying with these requirements the owners of motor vehicles are to have the same rights and privileges as are accorded to the owners and drivers of carriages propelled by horses. Automobilists cannot be prohibited from the use of any public streets, avenues, roads, driveways, parkways or other public place by any local regulation.

For violating any provisions of the act the offender will be fined $25, to be paid to the Overseer of the Poor. Justices of the peace, police magistrates and recorders shall have jurisdiction to try and punish all offenders. An appeal may be taken to the Court of Common Pleas.

Licensing and Tagging the Quakers.

Philadelphia automobile owners are complying very slowly with the requirements of the ordinance approved by the Mayor on December 26 last, which make it mandatory upon owners of automobiles to take out licenses from the Bureau of Boiler Inspection. Up to the end of last week only fifty-three of these licenses had been issued, and blue enamelled signs, seven inches long and four inches wide, were given to such of the owners and chauffeurs as applied. In one corner is the year and in another the number of the license.

These licenses and signs are to be issued annually in the future, and the bureau officials are anxious that automobile owners comply with the requirements of the law. The matter of the inspection of the machines themselves, as manufactured, has not been undertaken as yet, as it was thought to be more important to attend to the licensing of the operators themselves.

Globe-Girdling Tour Abandoned.

An inglorious ending of the globe girdling expedition of the "Passe Partout" has come about. The car is stranded at Nijni-Novgorod, Russia, and the trip has been definitely abandoned. No other outcome could have been expected. With perfect management even the scheme was a visionary one; but it seems to have had no chance whatever, being lacking in every requisite for success, even the sinews of war—money—not having been provided.

It is rumored, too, that Dr. Lehwess, the leader of the expedition, has been brought low by one of Cupid's darts. A fair Muscovite maiden is, so it is said, to be led to the altar, which may account in part for the doctor's willingness to call the trip off.

VISCIOUS QUAKER LAW

Excessive Tax Proposed in Pennsylvania Under the Guise of a Good Roads Bill.

In a "good roads" bill introduced in the Pennsylvania legislature a nasty blow at the automobile is aimed. This bill, which failed of passage last year, has been prepared by Arthur Kirk, of Sharpsburg, Pa. Any merit it may possess as a measure intended to further the cause of road betterment is vitiated by the savage attack it makes on the mechanically propelled vehicle.

Section 38 of the bill provides that "every owner or user of an inanimate motive power propelled, road travelling vehicle shall annually pay to his or her county treasurer (except makers) $20 on or before the first day of April each year, or $3 per month for any fraction of a year. For which he or she shall be given a licensed figured plate by his county engineer, which must be conspicuously attached on the left side of the vehicle so that its number can be easily read while the vehicle is in motion, and if the above license fee is not paid before the tenth of each year 50 cents for each month or fraction of a month. The above license fee, with cost of collection and all penalty for non-payment of license shall be paid to the informer who made information that license for that year has not been paid."

The bill is a good one to mark for defeat, or at all events for amendment.

Senator Grim, of Bucks County, last week introduced a bill in the Pennsylvania legislature providing for the registration of automobiles, licensing the operator and limiting the speed to eight miles an hour. The bill requires the operator to take out a certificate in every county through which he runs his machine.

Wisconsin Legislature Hard at it.

Legislators of the Badger State are now trying their hands at automobile laws. Last week Assemblyman Moldenhauer, of Milwaukee, introduced a measure providing for the registration and regulation of automobiles. All such vehicles are to be registered with the Secretary of State, and whenever approaching a team drawn by horses must either come to a full stop or proceed slowly so as not to give fright. They must be equipped with bells or horns and carry red lights at night. Reckless drivers are to be punished.

His Honor's Sound Sense.

It was a very sensible observation which Councilman Gnichtel, of Trenton, N. J., made last week. Mayor Katzenbach's veto of the recent automobile ordinance was taken from the table. Some action had been suggested, but Mr. Gnichtel said laws were now pending in the legislature affecting automobiles, and that the city better wait till one of those laws pass. "Then we will have something tangible on which to work," he added.

BAY STATE PREJUDICES

Massachusetts Solons Have Seven Bills Before Them—The Chief of Them.

No less than seven bills relating to the use of automobiles have been presented or prepared for submission to the Massachusetts legislature. They range, of course, from good to bad. Most of them betray the existence of the feeling so general at this time that the self-propelled vehicle should be hedged around with restrictions of all kinds —their owners compelled to register, undergo examinations, carry numbers, etc. In short, they are viewed as being entirely distinct from other wheeled vehicles and under suspicion merely because they are automobiles.

Of these bills the most lengthy and carefully drawn is the Cox bill. Except in the particulars referred to—in its assumption of a paternal tone—it is a good bill. Under its provisions a speed of twenty miles in the country and twelve miles in the towns is allowed. The bill provides that the Governor, with the advice and consent of the Council, shall constitute an automobile registration board. It then goes on:

Section 3. Every owner of an automobile or other motor vehicle, either personally or by some one in his behalf, before such vehicle is operated under his ownership upon any public street or way, shall file with said board a written statement setting forth the upon a public street or way, shall file with said board a declaration in writing duly name and residence of the owner, a fair description of the vehicle containing data sufficient for identification, such as type and style of vehicle, seating capacity and type and power of motor used.

Sec. 4. In case an automobile or other motor vehicle described in the statement filed as aforesaid shall not in the opinion of said board be lacking in the possession of good qualities of construction and of sufficient safety appliances, said board shall issue to said owner a certificate of registration, containing reference to the vehicle sufficient for identification and containing a serial number to belong to such vehicle only and to be signed by said board.

Sec. 5. Every person, before operating an automobile or other motor vehicle in motion signed by the declarant, to the effect that he is in fact an expert automobile driver, and such declaration may be made in general terms or with such qualifications as to style and type of machine, or otherwise, as the declarant may deem fit.

Sec. 6. In case a person who files a declaration, as provided for in this act, shall not, in the opinion of said board, be so lacking in physical and mental and other qualities as to render him a person unfit to be intrusted with the care and control of an automobile in a public street or way, said board shall issue to such applicant a certificate of registration to the effect that such applicant is registered as an automobile driver, with such forther designations and limitations or provisions as to the board may seem appropriate.

Sec. 7. Said board, before issuing any certificate of registration as aforesaid, may require the applicant to submit to such reasonable trials, tests and examinations as said board in its discretion may require.

Sec. 8. Each certificate issued under the provisions of this act shall be good and valid for the term of one year from the day of its date, and for no longer period. Due notice of the date of expiration of each such certificate shall be sent by said board to the last known address of the owner or driver respectively, not less than one month and not more than two months prior to such date of expiration.

Sec. 9. For filing the statements and declarations and for the issuing of the certificates of registration, and for the examination, trials and tests as provided for in the above sections, such fees shall be paid by the applicants as may from time to time be determined by the Governor and Council. Such fees shall be paid to the board, and shall be forwarded by said board to the treasurer of the commonwealth. There shall be allowed and paid to the members of said board by the treasurer of the commonwealth from the fees received under the provisions of this act such compensation as the Governor and council shall determine; and there shall be allowed and paid to the members of said board by the treasurer of the commonwealth from time to time, upon the approval of the Governor and council, such sums of money as may be certified by the chairman of said board to be required for its expenses.

Sec. 10. In any case where application is made for registration as aforesaid of either vehicle or driver or both, such driver or such vehicle being then duly registered in another State or country under provisions of law substantially similar to those contained in this act, or in any other case where such action may seem to said board to be proper, said board may in its discretion issue temporary certificates of application for registration, to be valid for a definite period of time to be expressed therein, and such temporary certificates may be further extended or renewed from time to time in the discretion of said board.

Sec. 11. No automobile or other motor vehicle shall be run on any public street or way unless either valid certificates of registration or valid temporary certificates of application for registration as aforesaid, both for such vehicle itself and as driver for the person then in charge or control of it, are then outstanding.

Sec. 12. No automobile shall be run on any public street or way unless such vehicle is equipped with two efficient brakes, at least one of which is efficient for backward motion as well as for forward motion, nor unless such vehicle is also equipped with efficient locking device for control of lever or other effective means for locking the vehicle if and while left standing, nor unless the steering gear is reasonably efficient and in good working order.

Sec. 13. No automobile shall be run on any public street or way unless such vehicle shall carry upon a vertical plane perpendicular to the longitudinal axis of the vehicle to the rear of the rear axis of the vehicle and so located as to be always in view, the same to be efficiently illuminated at night, the serial number of such vehicle corresponding to the serial number given in the then valid certificate of registration, such number to be in figures of white on an effective dark background, and each figure thereof to be not less than four inches in height and two nches in width, the strokes to be of uniform width of not less than one-third of an inch, and successive figures to have between them a free space of at least one inch; provided, that the provisions of this section shall not apply to an automobile run under a temporary certificate of application for registration as aforesaid, unless so required by the terms of such temporary certificate.

Sec. 14. During the time subsequent to one hour after sunset and prior to one hour before sunrise no automobile or other motor vehicle shall be run on any public street or way unless it shall be equipped with efficient and lighted lamp or lamps showing white light from the front, and from the rear showing red light.

Sec. 15. No automobile or other motor vehicle shall be run on any public street or way at any greater rate of speed than is reasonable and proper with due regard to the reasonable use of such street or way by other persons then and there, whether in the use of other vehicles or as pedestrians or otherwise, nor so as unreasonably to annoy or endanger any person.

Sec. 16. No automobile or other motor vehicle shall be run on any public highway outside the limits of a city, fire district or thickly settled or business part of a town at a rate of speed exceeding twenty miles an hour, and no such vehicle shall be run on any public way within the limits of a city, fire district or thickly settled or business part of a town at a rate of speed exceeding twelve miles an hour.

Sec. 17. Every person having control or charge of an automobile or other motor vehicle whenever upon a public street or way and near any vehicle drawn by animal power, or near any animal upon which a person is riding, shall so operate, manage and control such automobile or other motor vehicle as to exercise every reasonable protection of any and all persons near by. And if such animal or animals appear to be frightened, the person in control of such automobile or motor vehicle shall reduce its speed, and if requested by signal or otherwise by the driver of such animal or animals shall not proceed further toward him unless such movement be necessary to avoid accident or injury, or until such animal appears to be under the control of its rider or driver.

Sec. 18. Upon approaching a crossing of intersecting ways and also in traversing the crossing or intersection the person in control of an automobile or other motor vehicle shall run it at a rate of speed not greater than is reasonable and proper and with due regard to the traffic and the use of the intersecting ways, however slow such reasonable and proper rate of speed may be

Sec. 19. No person having control or charge of an automobile or other motor vehicle as driver shall fail to stop upon signal from a police officer or constable in uniform, or from any person whom such driver has reasonable cause to believe to be a constable or police officer, and no such driver upon such signal shall fail to remain long enough to give to any constable or police officer so signalling ample opportunity to make reasonable inquiries as to the name and residence of the owner or driver, and no such driver shall fail to make true answers to such inquiries.

Sec. 20. No owner of an automobile or other motor vehicle then present and no driver of such vehicle then in charge or control shall take flight for the purpose of escaping responsibility for any injury to person or property caused by collision between such vehicle and any other vehicle or person or thing.

Sec. 21. No person, whether or not the holder of a certificate of registration as an automobile driver, shall wilfully put in motion upon a public street or way any automobile or other motor vehicle without authority from the owner or driver or other person in charge or control of the same.

Sec. 22. The term "motor vehicle" in this act shall include all vehicles propelled by any power other than muscular power ex-

Digitized by Google

cepting railroad and railway locomotives and cars and excepting motor vehicles running only upon rails or tracks.

Sec. 23. Cities and towns shall not make any ordinance, bylaw or regulation inconsistent with the provisions of this act.

Sec. 24. Whoever violates any of the provisions of this act shall be punished by a fine of not more than $200 or by imprisonment for not more than ten days, or by both such fine and imprisonment.

Sec. 25. Chapter. 315 of the acts of the year 1902 is hereby repealed.

Sec. 26. For the purposes of the appointment and organization of said board and of registration of persons by it hereunder this act shall take effect upon its passage, and shall take full effect on the first day of the calendar month next succeeding the month in which the terms of office of the members of said board shall begin.

Sprags of Recent Origin.

It is interesting to recall that in the early days of automobiling sprags and similar devices were unknown. In 1895 the Pugeot people employed cliquets or ratchet wheels on their cars to prevent them running back on a hill owing to the motor stopping or the driving missing the gear in changing speeds. At that time no other maker used a device of the kind. Sir David Salomons met with a slight accident due to melting snow on a steep hill when the cliquet did not act. As a result he devised an arrangement to avoid such troubles in future that was a sort of double sprag. It was the first application of the bequille, or sprag, to a motor car, and resulted in its adoption by French motor car builders universally.

Radiators and Condensers of all Sorts.

If it is anything in the radiating line—coil radiators or the more showy honeycomb type—the Whitlock Coil Pipe Co., Hartford, Conn., make it. Radiators are the concern's specialty, three grades of coils being made. These coils are made up without the use of castings, the return bends being made of bent tubing, which are bent by means of special patented machinery without flattening or injuring the tube in the least. This makes a very superior radiator of greater

strength than is possible when made with castings of the same weight.

These radiators are made up complete, ready to attach to the car, and the finished dimensions can be such as to suit any desired space. The coils are painted dead black, and are secured by means of hardwood straps and spreaders, bound with polished brass straps, presenting a very handsome and substantial appearance.

At the recent automobile show at Madison Square Garden several honeycomb radiators made by the Whitlock people were seen. This ingenious transatlantic type of cooler is illustrated in one of its multifarious forms, from which a good idea of the principle of its construction—whereby currents of air are passed through the body of water—can be obtained.

Economy of Electric Fire Wagon.

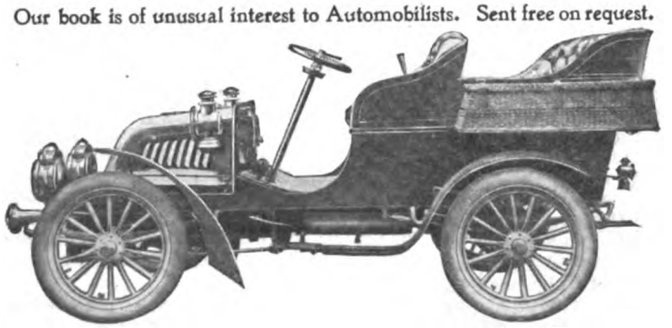
Some interesting facts are brought out regarding an electrical fire wagon which is being experimented with by the Berlin Fire Brigade authorities. It is capable of attaining a speed on the level of twelve and one-half miles per hour, and is driven by two electric motors, each of which is rated at 9 horsepower, but which can, on occasion, develop 12 horsepower without fear of damage. The vehicle, complete with battery, firemen, hose, ladders, etc., weighs seven tons. The cost of such a car is stated to be $3,000; the annual cost of upkeep and energy is put down at $625, this including 5 per cent. interest on the first cost, and 5 per cent. for depreciation and renewal. The average cost per kilometre works out at 2½ marks (about 62 cents), which is stated to be less than that of animal traction.

The Week's Exports.

Argentine Republic—3 cases motor vehicles and parts, $785.

British Possessions in Africa—3 cases motor vehicles and material, $861.

London—10 cases motor vehicles and material, $5,670.



Liverpool—4 cases motor vehicles, $3,086.

BUILT FOR AMERICAN ROADS.

The U. S. LONG DISTANCE TOURING CARS

Are Preeminent for Speed. Safety, Reliability and Economy.

Our book is of unusual interest to Automobilists. Sent free on request.

TYPE C—TONNEAU. Two Cylinders. Vertical Engine.

Built for service, long runs and hill climbing, simply operated, free from vibration, each part easily reached, no intricate machinery to get out of order.

Type A—Runabout, $1,250.
Tyye B—Tonneau, 1,500.
Type C—Tonneau, 2,500.

U. S. LONG DISTANCE AUTOMOBILE CO.,

Factory, 307 Whiton Street, Jersey City, 110-114 West 41st Street, New York.

FOR FIRE DEPARTMENTS

Vehicle and Figures Brought to Bear That Show Many Far-Reaching Economies.

In fire department work efficiency is the great desideratum. Next come cost of maintenance and space economy. In all three particulars the horseless type of vehicle scores heavily, as is shown by a comparison made of the cost of operation of the La France combination chemical engine and hose wagon and a horse drawn vehicle of similar character.

The combination wagon is of massive construction, and designed with extreme care. The running gear has an 8-foot wheel base and 58-inch tread; the axles are 2* inches, and perch rods are made of 3-inch channel steel. These rods are connected at each end in such a manner as to make the entire running gear very flexible. The wheels are 36 inches in diameter, with 4-inch solid rubber tires. The body is mounted on four elliptic springs.

Two separate steam engines supply the power, giving an independent drive for each rear wheel. Each of these engines is of the double cylinder type, high speed and double acting, and both are controlled by a single throttle lever operated from the centre of the seat. Either engine may be cut out of operation if required. Wheel steering is used, and consists of a worm with transverse block or nut, operating directly through a bell crank upon the steering wheel connection. The wagon is fitted with hand and tire brakes.

A chemical tank is carried on either side, having a capacity of 35 gallons each; while 150 feet of chemical hose is carried, and there is space for 1,000 feet of 2½-inch hose. Both the water and gasolene tanks are made of copper; the capacity of the gasolene tank is 15 gallons, of the water tank 30 gallons.

Provision is made for keeping up steam in the boiler by connecting with an ordinary illuminating gas supply, with an automatic cut-off, which breaks the connection and frees the vehicle as it starts. The speed of the latter is 20 miles an hour.

"The use of horses involves constant expense for the following items, none of which are chargeable to automobile apparatus," the La France people, whose factory is in Elmira, N. Y., say:

"Horses; feed; shoeing; harness; harness repairs; bedding; blankets; brushes and hostlers' supplies; veterinary surgeon; veterinary surgeon's supplies; stalls and fittings; stall floor renewals; horse pole; harness hangers and quick hitching straps, and incidental expenses due to runaway horses.

"The following items of expense chargeable to an automobile apparatus are not incurred with the use of horses. Gasolene, heating device for boiler, and repairs of machinery.

"The following items of expense would be common to apparatus of both types: General repairs, chemical supplies, and operator or driver.

"Based on the reports of ten fire departments in this country, the automobile, as regards maintenance, shows an average saving of $300 per year.

"Assuming an average life of an apparatus of either type to be twenty years, which is conservative, the following table shows the result:

"Original cost of horse combination wagon	$2,000
"Original cost of automobile combination wagon	5,000
"Saving in maintenance for twenty years at $300 per year	6,000

"In other words, the saving in the cost of maintenance for a term of twenty years will more than cover the entire original cost of the automobile apparatus by $1,000. Or, looking at it in another way:

"Saving in maintenance for twenty years	$6,000
"Increase in first cost	3,000
"Net saving	3,000

"In this estimate $1,000 has been allowed for miscellaneous repairs and parts in connection with the boiler, engines, etc., of the automobile wagon.

"There is a further saving in automobile apparatus, which has been omitted entirely from consideration, as it would be difficult to make an accurate estimate. Nevertheless this saving is actual.

"We refer to the saving which could be effected in the construction of fire houses, viz.: (a) The dispensing with a horse pole shortens the apparatus about nine feet, which represents a floor area of about fifty-four square feet; (b) the saving in stall space would be about ninety square feet; (c) no harness or hangers being required, the ceiling of the apparatus room could be at least three feet lower."

CAUSES OF SKIDDING

Parts Played by Tires, Differentials and Brakes and the Manner of the Resulting Slips.

"It is said that a carriage skids when it is thrown off its momentum, and its back wheels lose grip because of the slipperiness of the soil. In some cases it slides, in others it turns round and round, or waltzes. The principal cause of sideslipping is the carriage itself, the secondary cause being the soil," says M. Leon Auscher, of Rothschild et Fils.

"With rare exceptions all French automobiles have the two following characteristic features: (1) The motive force is transmitted from the small pinion shaft to the back wheels, which are therefore the drivers; (2) the pinion shaft is supplied with a 'differential,' a piece of mechanism which allows the carriage to turn, permitting the back outside wheel, at a turning point, to revolve faster than the interior wheel. When travelling in a straight line the revolutions of the inside and outside back wheels should be the same.

"These two features point to two results: An automobile is propelled from behind. As long as the direction is absolutely rectilinear all goes well, but should there be a deviation, from one cause or another, from the straight line, the 'back' tries to get in front, and if at this moment the grip of the wheels ceases, on account of a greasy road, then the automobile attempts to describe a circle, pivoting on one of its front wheels. The differential is an appliance which should, theoretically, govern the two back wheels, which, when travelling in a straight line, should turn at the same rate. Practically such is not the case, and it is easy to understand that the slightest irregularity in the regulation of these two wheels would cause a difference in their rotations, and when this occurs a skid is more than possible.

"Skiddings caused by the 'differential' have one peculiarity—they are automatic and at times occur in a most unexpected manner when the vehicle is pursuing a straight course. And, apart from the 'differential' and the soil, there are two other important factors which bring about skidding, and these are the pneumatic tires and the brake. The pneumatic tire, without an anti-skidding band, has a larger bearing on the road than a solid india rubber or iron tire, and the pressure on the surface of the earth is therefore weaker, and consequently the grip is less.

"The brake also plays an important part, for it is evident that if, at the moment of putting it on, the effect on the two back wheels is not identical a skid similar to those caused by the 'differential' is likely to occur, the difference in the rotary movement causing the carriage to slip at the side on which the wheel is most checked. There is not, however, a point upon which all automobilists agree. The majority say that one must put the brake on after disconnecting. I am not entirely of this opinion, for I have often remarked that a progressive 'braking' without disconnecting has a less 'skiddish' effect.

To Keep the Feet Warm.

While a spin on one's car during the winter is most exhilarating, there are many autoists who suffer from cold feet. To overcome this difficulty, a Frenchman has, states La Locomotion, fitted to his car an arrangement which accomplishes the purpose. It consists of an extension of the water-circulation pipes, the water heated by the motor being made to circulate under the floor of the car. Small grids are provided at the places where the passengers' feet rest, and to increase the heat radiation, the portions of the pipes under the grids are provided with radiating fins. Suitable valves are fitted, so that the water circulation under the body portion of the car may be opened or shut off as desired.

A similar arrangement has been fitted to a number of Benz cars. A tap is inserted in the water pipe leading from the engine to the tank; a branch is taken from this pipe on one side of the tap, and is led to a grid, made of copper tubing, placed on the footboard of the car, thence returning to the other side of the tap above referred to. By shutting off this tap the water is made to travel through the copper pipe forming the grid, the heat given off from this keeping the feet of the passengers warm. If it is required to throw the footwarmer out of action it is only necessary to turn the tap, when the water will return direct without passing round the grid.

The best position of this grid is a few inches from the floor of the car, so that the feet can be placed, not on it, but beneath it, the feet being kept warm from above and not through the soles of the boot, as is generally the case. The arrangement, in conjunction with a rug or apron, will keep the occupants on the front seat of the car perfectly warm, even during severe weather. Of course, a similar grid can be provided in the tonneau at the back of the car. The arrangement can be fitted at a very small cost, and has also the advantage of helping to keep the water cool, acting as a radiator as well as a footwarmer.

Test of a Sthenos.

An interesting trial of a Sthenos carburetter was made recently, which showed its wide range of action. A 1¾ horsepower motor fitted with one of these carburetters was arranged to drive a dynamo for the purpose of testing its output. The carburetter was then supplied in turn with gasolene, alcohol and kerosene, and ran well under each of these conditions, giving a constant output from the dynamo. It is further stated that the exhaust was devoid of smell with all three fuels.

CARING FOR THE CAR

Abuses to Which it is Subjected by Beginners and the Expense Bills That Ensue.

"In running an automobile of either steam or gasoline I have found a great number of things one must learn to do. For instance, in a steam motor one must not force the throttle or starting lever suddenly, for fear of jerking the automobile almost from under one or tearing the engine from its fastenings," says an experienced autoist.

"While an automobile is made to stand a great deal of abuse, they, of course, cannot stand treatment which will break up any machine built. A beginner almost invariably has unnecessary repair bills, due entirely to the fact that he does not understand what not to do. I recall an instance in which a customer bought a second-hand steam carriage which had not been used for more than six or seven weeks, and it was fully as good as new, yet in one month's time he had paid about $100 for repairs. He, of course, blamed the motor for the enormously high bills for repairs, stating that the machine was no good. Had he been familiar with machinery he could have been taught more easily how to handle it, and would have had no trouble with his automobile.

"He would forget to oil his machinery, and wonder why it would not run. The consequence was a very badly cut cylinder and badly cut crosshead guides. This necessitated the removal of the engine from the carriage and reboring of the cylinder. Of course, this was the fault of the machine and not the operator. On his next trip he forgot to look after his water, and in consequence of this had to pay for a badly burned boiler. This, of course, made it necessary to again tear the machine apart. This performance was gone through for a whole month. By this time the owner was thoroughly disgusted and ready to sell out for almost nothing, but was induced to try again. Now he can get along without his enormous monthly bills, and is fully satisfied that he was to blame.

"Another thing beginners must learn is that an automobile is a machine and needs attention the same as any other machine. One customer will say, 'I want an automobile that I do not have to oil and take care of.' Still another is willing to oil up every hundred miles or so, while if you want your machine to last you must oil every fifteen or twenty miles, for the less oiling you do the sooner your machinery will cut and wear out; the better attention you give your car the longer your machinery will last, and the less it will cost for repairs. This rule holds good in all makes of automobiles, for no manufacturer has as yet succeeded in overcoming this difficulty of giving it proper attention."

CAN BE CLEANED TOO MUCH

How Cars are Injured by Unwise Washing—The Care Necessary in Painting.

"Carriage painting and varnishing is a deep and momentous subject. It is said a prominent carriage builder of Kentucky, one of the kind who does not sit down and curse his varnish maker for all the mishaps which occur to his work, both before and after it leaves the shop, told the following story illustrating the fact that in some instances at least it is not the use, but the abuse, of the varnish which spoils the work," says a correspondent of the Hub:

"'You see, our soil plays the deuce with varnish, spotting it and sometimes entirely removing the gloss if allowed to dry on. Well, every now and then a customer whose wagon is under a cloud from this cause walks in and pitches into us for not understanding our trade or using bad varnish. We protest and explain, and sometimes—once in a great while—make 'em see it. As if this was not enough to contend against, we were called out one morning to examine a physician's phaeton which we had finished a short time previous in our very best manner. Paint and varnish were entirely gone from some parts, the rest looking as though the job had been varnished with muddy water. The irate doctor suggested that we do that job right over again, saying he "always supposed you knew how to paint," but "take in your shingle now," etc.

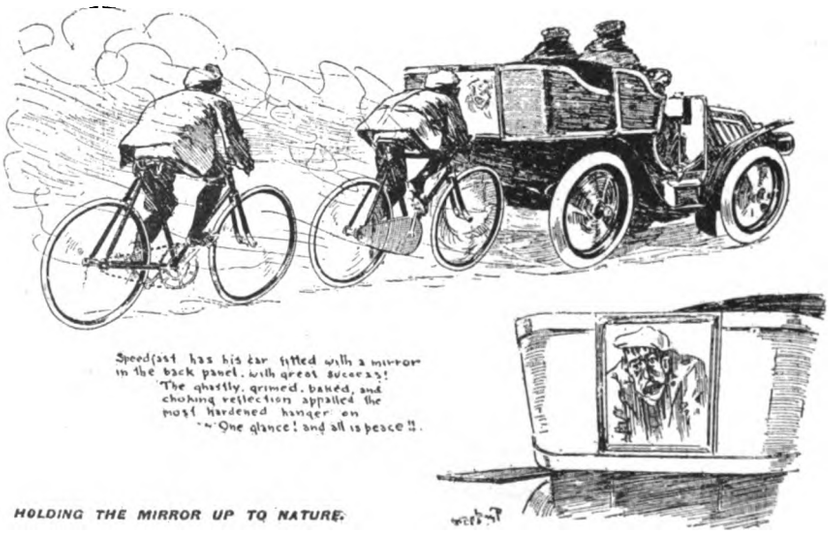
"'We asked for a few days to inquire into the cause of this paint wreck, as we could not at the moment account for such an extreme case, and we know the paint and varnish were all right and properly applied. Our painter and myself passed different views on this subject, but were unable to solve it. We chanced to see the stableman, and we inquired with an assumed carelessness of manner how he always kept the carriages under his care looking so much cleaner than those of the neighbors. He at once swelled up with pride, put on that appearance of vast intelligence which the darky so well knows how to assume, and said: "Why, yer see, I des takes soap and hot water and dese yer tother fellows uses cold water, he! he! he!" "Oh, I see. Well now, Samuel, don't you tell anybody of your new idea. You're entitled to keep that all to yourself." When the doctor called again we convinced him that his phaeton had better be done over, but not at our expense.'

"A case once came under my own experience," continues the correspondent. "A doctor had a stanhope buggy, built of the best material that market could produce. Care had been taken in applying each coat of paint and varnish. In about three months it was brought back, and I would never know it was the same buggy. Every joint in the body was swelled apart and paint had scaled off. The doctor claimed he had been cheated and would never have any more work done at that shop. An inquiry revealed that it had been washed two or three times every day and never had a chance to dry out. The body had to be removed from gearing and placed near a fire to dry out before fastening down the joints. It never could be fitted up as it was before unless by repainting. Too much washing is injurious to the varnish, and more especially when it has lately been turned out. Care should be exercised in applying each coat to see that the coat already on should be perfectly dry before another is applied.

"Go where we may among manufacturers of all styles and kinds of carriages and ask the question, 'In what part of your business do you experience the most annoyance?' the universal answer will be, 'The paint shop.' The same condition of things has existed for years, in fact as far back as carriages were deemed worthy of being painted; yet, knowing all this, there has been but little, if anything, done that would remedy the evil.

"If the paint on a carriage fails to give satisfaction the white lead, oil or varnish is blamed, but the idea of looking into the manner in which the paint was applied is scarcely ever entertained, except in a few of our leading factories. A good foreman is supposed to be all that is required. He may, however, be provided with the worst class of help and occupy a shop no better adapted to carriage painting than a barn would be. The youngest apprentice, who knows nothing about the nature of paint or how it must be applied, except that the wood must be covered, is selected to lay the foundation coats, or priming. He applies it to the wood without brushing more than is necessary to cover, and in all degrees of thickness.

"The same class of help sandpapers, and, in fact, does everything up to and including the rubbing of the rough stuff; after which the painter is expected to produce a good job. If he fails, the man who sold the materials employed commonly receives the blame. Good painting can only be secured by the employment of skilled labor and the use of good materials; without the former even the latter is of but little advantage.



"There are, however, extremes to be avoided in carriage painting even when the best material is at hand. One, the excessive use of turpentine; the other, the excessive use of oil. Another is the excessive use of japan."

"Garage;" its Origin and Meaning.

Two years ago scarcely one American in a million knew what garage meant. Strictly speaking, a garage is a siding into which vehicles are shunted, such as the railway sheds in which one sees engines lying by. In France it has usually been used to describe the place in which boats are put aside while not in use. When automobilism came along somebody employed it to describe what might be called the coach house in which motor cars are sheltered, and it caught on. The word, like many other French works—serviette, table d'hote, chic, for instance—was taken up in this country and looks like staying here.

Squeaks From Dry Springs.

It frequently happens that a lot of squeaking and grinding arising from a car is due to the fact that the springs are very dry—that is to say, the grease between the leaves of the springs having become dried up or pressed out, the leaves themselves are bearing harshly upon one another. A simple way of remedying this is to jack up the car body and to open the springs slightly by means of a screwdriver, and working in some gear box grease by the aid of a thin bladed knife. The superfluous grease which will be pressed out of the springs upon lowering the body should be immediately removed, otherwise it will be apt to collect dust and work in between the leaves, thus causing an objectionable grinding noise.

HOLDING THE MIRROR UP TO NATURE.

Added to A. C. A. Roll.

At a meeting of the Board of Governors of the Automobile Club of America on last Tuesday it was decided to send delegates to represent the club to the convention of the National Road Makers, which is to be held at Detroit February 13 and 14, and also to send delegates to the convention of the National Good Roads Association, to be held at St. Louis, April 27.

Nineteen new members were elected. William Rockefeller, James A. Burden, Jr., Lawrence Waterbury, Henry Randolph Sutphen, Dr. James C. Ayer, J. McMillan Hamilton, James E. Woodbridge, John B. Trevor, Carleton W. Nason, William E. Harman, E. Virgil Neal and Frederick Glassop, of New York City, John W. Thompson, Yokohama, Japan, and E. H. Bennett, Bayonne, N. J., were added to the active list. W. E. Hartness, Cleveland; Clifford B. Harmon, Philadelphia; S. D. Waldron, Warren, Ohio; William H. McKelvy, Easton, Pa., and Alfred Weed, Providence, R. I., were placed on the associate roll.

Bridgeport's New Quarters and Committees.

The new quarters of the Automobile Club of Bridgeport were opened last week with a smoker. It was attended by about forty members, and was a great success.

A legislative committee was appointed, consisting of Messrs. Frank T. Staples, Thomas Fish, Dr. Dow R. Beebe, Gregory S. Bryan and A. McNeil, jr.

A resolution was passed protesting against the change in the present Connecticut automobile law, and it was decided that a committee from the club should appear at Hartford before the committee on public safety in conjunction with representatives of other automobile interests to oppose the passage of the bill.

A good roads committee was also appointed. It consists of Frank Miller, W. S. Teel, jr., and Roderick P. Curtis. They were instructed to appear before the Board of Apportionment and urge the necessity of a liberal appropriation for good roads.

After the transaction of this business the evening was given over to an interchange of experiences, chiefly of a humorous nature.

Fined Scorcher and Manufacturer.

Parisian ways are frequently quite beyond understanding. A chauffeur was recently arrested and sent to prison for two days for excessive speeding. Then a plate on the body of the vehicle revealed that M. Pieper was the manufacturer of the criminal car, and he was promptly fined for building a vehicle capable of such delinquencies.

Highly indignant at this new rendering of a manufacturer's liability, he took the matter to the Appeal Court. Their decision is that the maker of an automobile is not necessarily criminally responsible for the speed it attains. There is a nasty reservation about that word "necessarily," which will doubtless lead to the matter being refought in the courts.

Motor Cars vs. Ice Yachts.

With a broad sheet of smooth ice for a roadbed automobiling possesses, in addition to its other charms, that of novelty. C. A. Benjamin, of Syracuse, has been testing the matter this winter, and is enthusiastic over it. He makes use of Onondaga Lake, and is so impressed with the speed possibilities of the course that he believes the world's mile straightaway record could be broken on it. He says that he has no trouble whatever in running his car straightaway at top speed over the frozen lake's surface. He said he also got a lot of fun out of racing against ice yachts. He could go straightaway to a given point, and they would have to tack. Under these conditions it made a pretty even match.

Proved its Value in Postal Service.

Whenever the Oldsmobile is spoken of before the Detroit (Mich.) postal authorities they smile broadly. These little cars did much to get rid of the excessive accumulation of Christmas mail, completely overshadowing the horse and wagon method of delivery. Indeed, the postmaster was so enthusiastic over their work that he declared his belief that three Oldsmobiles will do the work of fifteen horses. The illustration shows one of the regular stock runabouts, equipped with a mail box and ready to start on its route, fearing neither snow nor any other of the many varieties of weather the Detroit winter produces.

First of French Road Races.

February 22 has been fixed by the Automobile Club Bernais for the Palois reunion. The race will be from Pau to the Department of Hautes Pyrenees, then back to Pau and along the Bordeaux Road to the limit of Gers, back again to take the Bayonne Road up to that of the Landes at Puyoô. The finish will be at the entrance of the National Park, altogether a run of 225 kilometres.

Good Roads; Poor Prospects.

H. T. Eisenberg, of Chicago, has just returned from the Island of Jamaica and relates some interesting automobile experiences which he had while there, but does not hold out much hope of the demand that is in prospect. He made one run from Kingston to Newcastle over the Military Road. The run is a hard climb of twelve miles, 4,000 feet being ascended in this distance. Mr. Eisenberg made the run with a friend, in a Locomobile runabout, in just four hours. Another trip was made to Port Antonio, from Jamaica, in four hours, being a little less than the railroad running time between these points.

Mr. Eisenberg states that the Locomobile created a great deal of excitement on the Island, but that so far as business is concerned, there are few people who have money to invest in automobiles. Most of the army officers live well up to their income. The roads on the Island are very good, although there are many curves which make very high speed impossible.

When Fuel Cost Varies.

"It is remarkable what a difference there is in the consumption of supplies when my chauffeur is in charge of my car and when he is away," remarked an autoist to the Motor World man the other day.

"My bills for gasolene and lubricating oil are rather high, it seems to me, and when I take the car out for a day's run there is a big difference. A fifty-mile run, for example, will be accomplished without half emptying my gasolene tank, while if my chauffeur drove it would not last the run out. That is to say, a very rough calculation of the miles run and the gasolene purchased would indicate such a result. I never see the tanks refilled en route—that is always done in the garage.

"It does look odd, and some day when I have a little spare time I am going to look into the matter."

From Berlin to Vladivostock.

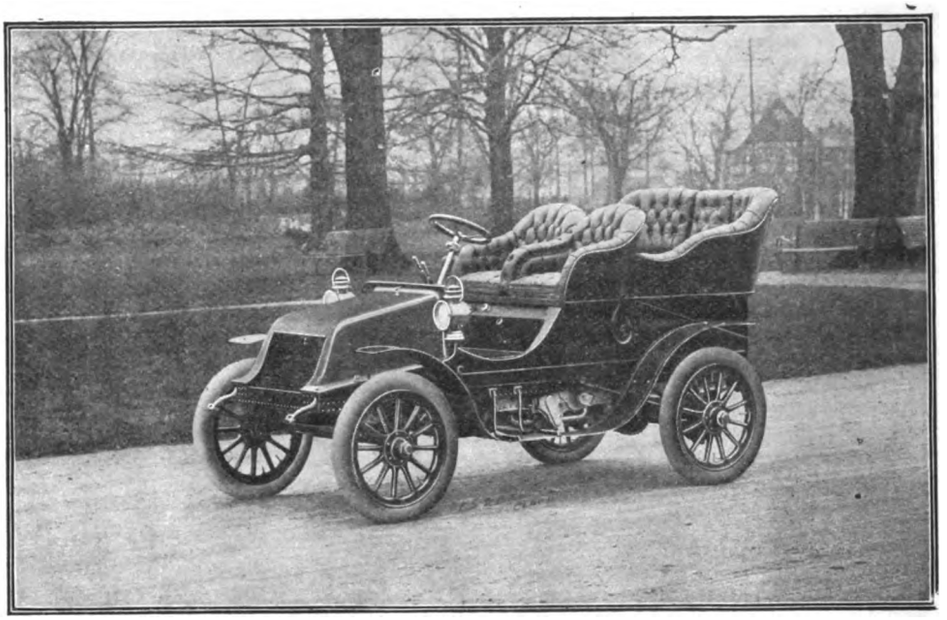
MR. CUDELL is now crossing EUROPE and ASIA from BERLIN to VLADIVOSTOCK on one of these machines.

A HIGH-CLASS GERMAN CAR

The CHAINLESS CUDELL

Noiseless One, Two and Four Cylinder Types. 6 and 8 Horsepower Motorettes, 3 speeds and reverse. 12 and 16 Horsepower. Tonneau, 4 speeds and reverse. Bevel gear, direct drive on high speed, gasolene tank and can made non-explosive by safety device as used in German army, all steel parts made of Krupp steel, four oiling devices. We invite inspection. Instruction given to intending purchasers. Compare our prices with others. All duplicate parts in stock. All cars single lever control, double suspension. Trucks and Delivery Vans.

J. C. BRANDES, OFFICE 28 W. 33d St., NEW YORK



U. S. Agent for CUDELL & Co., Aix-la-Chappelle.

TELEPHONE, 2754 Madison. AGENTS WANTED EVERYWHERE.

$2,500

WILL YOU

pay two thousand, five hundred dollars for a genuinely good automobile which represents the present highest standard of excellence in design and manufacture?

If you do not appreciate the vital difference between superficial perfection and construction that is honestly good and thoroughly scientific from wrist-pins clear out to the last coat of finishing varnish, then you will not be especially attracted by the new twenty horse-power

WINTON TOURING CAR

We hope, however, that you will recognize our latest successful efforts and accord this new model the consideration it deserves. You who have been conscious of the rapid development of the successful American automobile, who have watched it through its various stages since the time—years ago—when Mr. Alexander Winton ran upon the roads his first "horseless carriage," will recognize the great strides we have made toward the goal of perfection in automobile building, and can appreciate in no small sense the genuine pride we feel in this latest triumph.

It is not intended as a "sensation." It does not incorporate a vast number of rare features for which we, in justice, can claim no more than theoretical excellence. Its construction does not embody a vast number of untried experiments, and we do not, therefore, ask anyone to share in a manufacturer's gamble. In presenting this model we give the very essence of practical and thoroughly tried out experience.

Consider the matter of delivery: During the current season we will be able to manufacture just one thousand of these twenty horse-power Winton Touring Cars. A liberal percentage of the total output has already been sold. Supply will not meet the demand, of this we are quite sure. Would it, therefore, not be an act of wisdom to file your order early and allow some one else to be disappointed as the result of procrastination?

JURY FAILED TO AGREE

Long Island Motorphobes Balked by Strong Testimony But Case Will be Tried Again.

Much interesting testimony anent the crusade of the Long Island Highway Protective Association against automobilists was brought out at Hicksville, L. I., last week. The case of Paul Verget, chauffeur for Cord Meyer, was being tried, and even a Long Island jury was unable to agree as to his guilt. He will be tried a second time on February 20.

One of the deputy sheriffs who made the arrest testified that out of 1,000 automobiles he had timed only seventeen had exceeded the legal limit. Another deputy testified that he had been hired to watch automobiles only, leaving horse driven vehicles alone. A surveyor said that the measured course where the alleged offense was committed was No. 35. For the defense it was claimed that the car was coasting when the arrest was made.

The trial took place in the Hicksville Town Hall before Justice Augustus T. Remsen and a jury. This was the second time Verget has been arraigned before Justice Remsen on the same charge of violating the automobile speed law. The first time he was brought before the Justice it was found that there was a clerical error in the complaint and it was withdrawn and a second complaint sworn to and the warrant issued and served.

Ex-Judge Joseph Steinert appeared for Verget and Meyer and George B. Stoddart represented the Long Island Highway Protective Association. The first witness sworn was William H. Seaman, of Glen Cove, the civil engineer and surveyor, who laid out the one-eighth-mile course over which Meyer is alleged to have exceeded the speed limit. Seaman said that this course was No. 35 and had been surveyed by him and was correct; he said it commenced on the Jericho Turnpike about 95 feet west of Hubbs' lane and ended in front of John White's residence.

Daniel V. Titus, a special deputy sheriff, testified that he was stationed at the east end of the course on November 1 and gave the signal to Deputy Sheriff John Garvin just before Mr. Meyer's automobile crossed the line. He said he waved a handkerchief on the end of a pole. He stated on cross-examination that he was seated on the ground inside of the fence and was not in the open highway. When asked if he was paid by the protective association he said that he was not to his knowledge, but received his pay from Mr. Meehan, of the District Attorney's office, and supposed that the money came from the District Attorney. He said that he had not been told to watch for any violations of the speed law as regard horses.

John Garvin, a special Deputy Sheriff, of Oyster Bay, testified that he was stationed at the central stake or the one-eighth of a mile point and it was his duty to time the automobiles, and that on the day referred to he had received the signal from Titus, and when Mr. Meyer's automobile crossed the line he saw that his stop watch gave the time for the one-eighth at 15½ seconds, and that he signalled to Officer Bloxsom at the west end of the course to arrest the chauffeur. When cross-examined he said he was not on the highway, but in the yard of John White. He denied that he knew that he was paid by the protective association. His watch was an ordinary stop watch and was tested every two or three days by Mr. Meehan, who possessed a better timepiece. H could not say how fast an automobile was going without the aid of his watch and would not swear to the speed and relied solely upon his watch. He said he had timed about one thousand automobiles and out of that number only about seventeen exceeded the speed limit. He acknowledged that just prior to Mr. Meyer passing another automobile had gone over the course at a forty-mile clip, but the chauffeur was not arrested, as he would not stop for Officer Bloxsom when ordered to do so.

Counselor Steinert asked the Justice for an interpreter for Verget, as he could only speak French. Counselor Stoddart recalled Officer Garvin to prove that Verget could speak broken English, as he had done so in Justice Franklin's court at Oyster Bay. Justice Remsen refused an interpreter for Verget and Counselor Steinert refused to place him on the stand.

Cord Meyer was the last witness, and the only one for the defense. Mr. Meyer said that he had driven his automobile from New Suffolk that day, starting at 9 A. M., and had stopped one-half hour at Smithtown for lunch, and that it was about 2.30 P. M. when he was arrested at Jericho, showing that he had not traveled more than fourteen miles an hour on the entire trip. He said the machine was an eight-horsepower and not capable of traveling more than twenty miles an hour and that at the time he was stopped the machine was thrown out of gear and was simply coasting, as they had come down a small hill before arriving at the staked course. He could not swear that he was going more than twenty miles an hour at the time.

The jury, composed of Henry F. Huettner, Peter O'Brien, Frank Marrs, Adolph Fleischaurer, William Braun and James H. Seaman, were not charged by the Justice, although Counselor Steinert asked that certain points should be made clear to them. The jury was out nearly an hour and finally reported that they could not agree, four standing for conviction and two for acquittal.

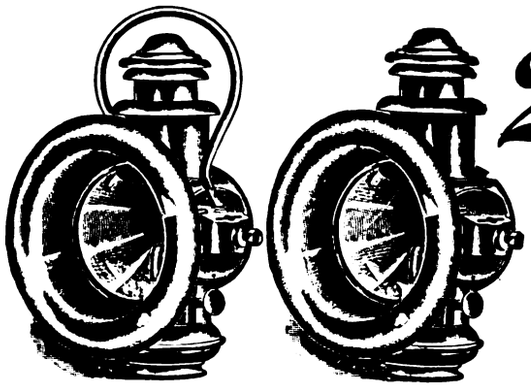
The jury was excused and another jury drawn. The next trial will be held on Friday afternoon, February 20, at the same place.

Mr. Meyer said that he had never had any trouble in his own town and he always made it a point to give the driver of a horse the benefit of the best part of the road and thought that was proper at all times. He said that he had to suffer for the reckless driving of others, as the people looked upon all as bad because a few were.

A GERMAN IDEA OF THE SITUATION.

Timid Horse; Sympathetic Jury.

Common sense appears to have had little to do with a verdict for $600 rendered at Portland, Me., last week in an alleged automobile runaway suit. The plaintiff was a woman, described as young and pretty, and she asked for $2,000 damages for injuries received. Testimony was introduced showing that the horse which ran away with her was one not safe for a woman to drive. But the intelligent jury found for her, although for only $600.



The suit was brought by Mrs. Lombard, of South Portland, against Flavel A. Chaplin, of Portland.

Mrs. Lombard's story, told after the jury had been escorted to the junction of State, Congress and Pine streets, to take a view of the location, was, in brief, that on the day mentioned in the writ she and her mother, Mrs. Thomas, were driving up State street in a box buggy. Their horse was of a kind disposition and under perfect control. When they were passing through State street they saw the defendant's automobile turning the corner of Pine street and coming toward them. Mrs. Lombard called for the whip, but finding that the automobile was not lessening its speed she returned the whip and kept a tight grip on the reins. Just before the machine passed, making a noise and emitting steam, the horse pranced, and as it passed she swerved, bolted toward the side of the street and ran away. Turning into Congress street, the wheels struck the car track and the carriage was overturned.

On cross-examination Mrs. Lombard said that once when the horse was fastened by a hitch weight in Middle street she was frightened by an automobile and ran away. The defence put in its evidence, and many witnesses were called to show that the accident was due to the horse, which was said to be not a proper animal for a woman to drive. L. A. Goudy and Adam P. Leighton, who had owned the animal, testified that they did not regard the horse as safe for a woman to drive who was not an expert horsewoman, and that they had found the animal easily frightened and had sold her on that account.

Counsel for the defendant stated that the case would be appealed.

For Lubrication of the Chain.

In addition to their graphitoleo for gears and flake graphite for motors, the Joseph Dixon Crucible Co., Jersey City, N. J., report a growing demand for their graphite motor chain compound, which, being put up in three-pound cakes, is of a size and shape for general and convenient sale and use.

The compound is designed not only for application to the face of the chain, but to reach the wearing surfaces of the pivots. It is applied in this fashion: First thoroughly clean the chain by repeated immersion in naphtha or benzine. When dry place in a flat pan large enough to receive the chain when coiled up somewhat loosely, and then melt in the pan enough of the motor chain compound to entirely cover the chain. The temperature of the melted compound should be at least 180 degrees, to insure sufficient fluidity, so that it will reach the interior wearing surfaces of the chain. The chain should be moved about as much as possible to aid the composition in reaching the furthest crevices. Removing the chain, allowing it to cool and again immersing in the compound will aid materially in bringing about this result. When finally removed the surplus compound is wiped off and the chain allowed to become cold. Never use the chain before perfectly cold, as the material would then be forced out of the joints. This treatment will surround each pivot with a bushing of excellent lubricating quality, hard and durable.

Deals With the Autocar.

In style befitting a handsome product, the merits of the 1903 Autocars are set forth in a catalogue that it is a pleasure to pick up. It is simple and tasteful and gives concisely all the details of construction. Attention is called to the improvement in the transmission gear and the enlargement of the tonneau. This is one of the chainless types, using a bronze bevel gear. The drive from the transmission case to the rear axle is by means of two steel cardan joints (with a hollow bronze cross piece for receiving lubrication), with the shaft having the bevel gear. Five models, a tonneau, a top runabout with rumble seat, the same without the top, a runabout with top and a rear boot and the same without the top, are shown by the cuts, and a splendid top view of the chassis also is shown.

Look to the Brakes.

The brakes of an automobile may in various respects be compared to the safety valve of a steam boiler. Both are safety appliances, and must, to be reliable, be adjusted perfectly and kept in perfect repair. In stationary steam plants the safety valve is periodically lifted off its seat by the engineer or fireman to insure its not sticking to the seat by rusting and thus giving a false sense of security. Similarly the brakes of automobiles, especially those running in hilly districts, should be examined periodically by their owners.

Labouchere on Speed Limits.

So excellent a person as Henry Labouchere is now advocating that the speed limit for automobiles in England be raised. In London Truth he says:

"Has not the time come when the twelve mile limit of speed ought to be reconsidered altogether? On many a country road, with a clear course and no danger from side turnings, there is no danger in twenty-five miles an hour. The present maximum limit is absurd, because it takes no account of the fact that a properly built automobile is far better under control and can be stopped 'dead' more quickly than any horse vehicle going at the same pace.

"My impression is that the safety of the man in the street would be quite as well, and probably better, provided for by imposing severe penalties on reckless driving, with heavy responsibilities for accidents so caused, and leaving the question of recklessness to be judged entirely by the circumstances of each case, than by setting up a statute as an arbitrary standard of maximum speed."

Draught of Honeycomb Doubted.

"The statement that the induced draught or honeycomb type of radiator is more efficient than the old pattern is one not justified by experience, when the car is in motion, whatever may be the heating on a stationary vehicle," says a doubter of this Mercedes feature.

"Its use reduces the quantity of water carried, but that is not necessarily an increase in efficiency. The old system of radiator has reached perfection, so far as efficiency is concerned, and the advantage must be sought in other and secondary considerations. There are authentic cases of the distance of 500 miles being covered without any necessity for refilling the tank, during the whole of which distance the water has kept perfectly cool. That is complete efficiency. Weight may be reduced, but complication and risks of injury inevitably enter when air is induced through a honeycomb by a fan."

Road not Owned by Rockefeller.

John D. Rockefeller, jr., on his father's estate at Pocantico Hills, frequently orders automobile drivers to leave the place. Large signs have been erected bearing this notice in large black letters: "No motor cars allowed."

Young Mr. Rockefeller and his wife, driving to the Tarrytown station recently, met Postmaster George E. Johnson, of North Tarrytown, in an automobile. They were on the old Bedford Road, which passes through the Rockefeller property, but which was recently deeded to the village. Young Mr. Rockefeller evidently forgot that. He stopped the postmaster and informed him that no motor cars were allowed there.

Mr. Johnson replied: "I beg your pardon, sir, but this is a public highway."

Mr. Rockefeller looked around in surprise and drove on without a word.

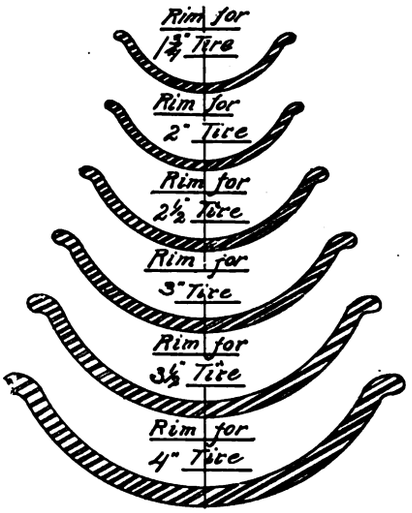
OF COURSE,

every one who knows anything about automobiles knows that we supply most of the finest tubing and rims used in the best cars.

OUR SUPERB



Swedoh Spring Steel Rims

in both Crescent and Clincher types are famous the world over.

They do much in increasing the all important "factor of safety" as well as saving tire wear by retaining their shape under all stress and strains.

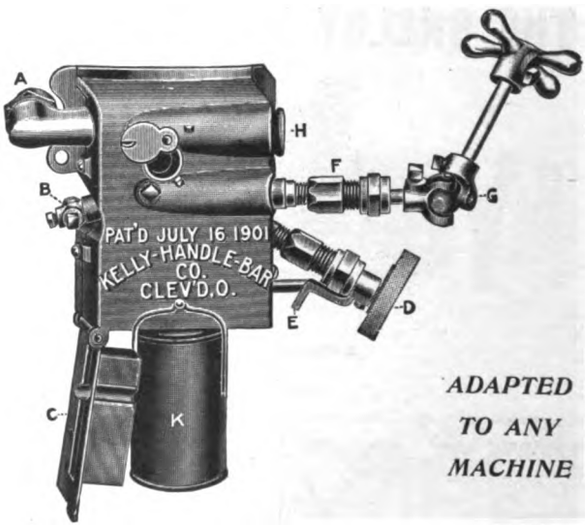
Most makers are wise enough to use them—if they do not specify them.

We also manufacture all kinds of hot and cold rolled hoop, strip and bar steel, etc.

The AMERICAN TUBE & STAMPING CO.

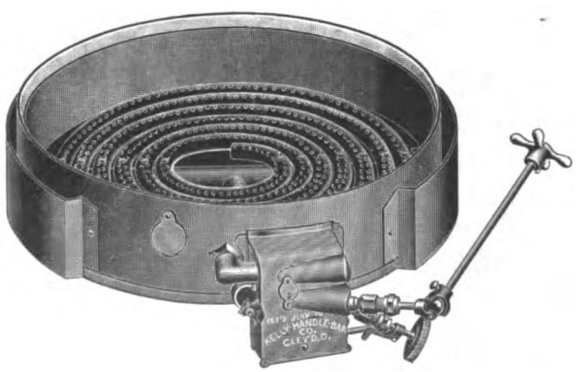
Successor to the Wilmot & Hobbs Mfg. Co.,

BRIDGEPORT, CONN, U. S. A.



THE NEW

KELLY GENERATOR

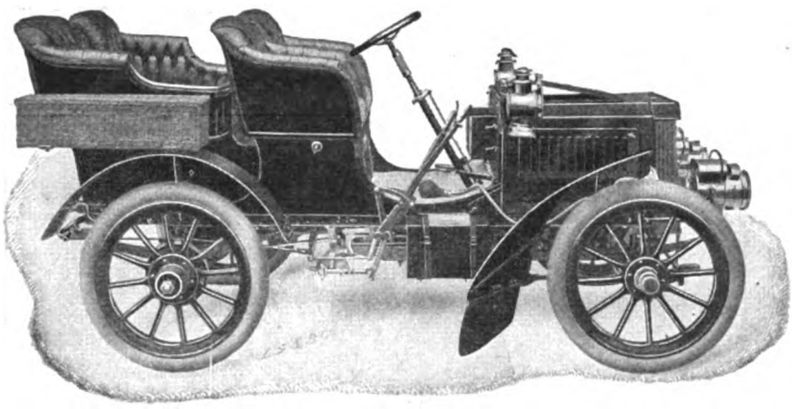


for Steam Vehicles is a Trouble Saver.

No Steam Car is complete without one. Does away with drip cups and all annoyances. Perfected in every way and always reliable.

Strongly made with all connections outside. Easily adjusted. No flaring or flashing in lighting, even in the strongest wind. Main fire controlled at seat. Compact and neat in appearance and enclosed in aluminum case.

ADAPTED TO ANY MACHINE



The New One-Piece Steel Tubular Burner

with entirely new casing. Has no gauze or holes in the bottom, the air being taken in from the ends. Absolutely eliminates all danger of fire under-lapping. As there are no air-tubes through the continuous stop-tube the burner even if red-hot cannot back fire. One of the most important improvements yet made. Thoroughly tested—as are all our products. Write for circular.

The Week's Patents.

719,327. Transmission Gear Mechanism. Ralph B. Hain, Los Angeles, Cal., assignor to Auto Vehicle Co., Los Angeles, Cal., a corporation of California. Filed July 30, 1902. Serial No. 117,651. (No model.)

Claim—1. In a transmission gear mechanism of the character described, the combination with the main drive shaft, a pinion fixedly held thereon, a central drum loosely mounted on said drive shaft, and having a laterally extending hub, a pair of drums disposed one at each side of the central drum, the drum being loosely mounted on the drive axle, the drum being loosely mounted on the hub of the central drum, a sprocket pinion on said hub, a sprocket rim on the body of the drum, brake devices co-operating with the drums, the central drum having a number of transverse journal bearings, a shaft in each of said bearings, a large gear on one end of the shafts, a small gear on the other end, and held to mesh with the pinion on the drive shaft, the drum having an internal annular gear rim, held to mesh with the large gear on the shaft mounted in the central drum, an axial gear on the drum held to mesh with the small gears on the central drum supported transverse shafts, all being arranged substantially as shown and described.

719,328. Governor and Throttle Valve Controlling Mechanism. Ralph B. Hain, Los Angeles, Cal., assignor to Auto Vehicle Co., Los Angeles, Cal., a corporation of California. Filed July 30, 1902. Serial No. 117,652. (No model.)

Claim—1. A mechanism of the character described, comprising in combination with the engine drive shaft, and the engine throttle valve, a governor device mounted upon and operated by the crank shaft, and a manually operatable lever mechanism separate therefrom, said governor device and lever mechanism having a common connection with the throttle valve, and each being arranged to operate independently of the other for opening and closing the said throttle valve, as set forth.

719,407. Combined Regulator and Safety Mechanism for Explosive Engines. Leonidas G. Woolley, Kenton, Ohio, assignor to the Magneto Electric Co., New York, N. Y. Filed February 28, 1902. Serial No. 96,192. (No model.)

Claim—1. In an electric generating mechanism of the character stated, the combination with the igniting means including the member 2, the terminals 1 1a mounted thereon, and the lever 3 having a bridge carrying contacts to engage the terminals 1 1a, said lever being pivoted near its outer end whereby to normally gravitate to bring the contacts to a closed position, the outer end of said lever terminating in a heel portion 3a; of the main shaft, the centrifugal governor mechanism connected thereto and controlled by the rotation thereof, the vibratory lever U, said lever having an arm u, and the lever 5 detachably connected with the lever arm u, and having its outer end arranged to engage the heel of member 3 when the speed of the shaft becomes excessive or beyond a predetermined point, a valve regulating means comprising the shifting lever u' rigidly connected to the vibratory lever U, and extending downward, the disk s engaged by said shifting lever, the cam r x, and the valve, all being arranged so that the valve is shifted at the same time the lever u engages the heel of the member 3, as set forth, substantially as shown and described.

719,418. Electric-Accumulator Plate. Auguste Bainville, Nanterre, France. Filed July 14, 1902. Serial No. 115,462. (No model).

Claim.—An electric accumulator consisting of a number of rods separated from each other by a removable corrugated sheet of perforated insulating material arranged in such manner as to cover the face of one rod and the back of the next.

719,420. Steam Boiler. Robert W. Barton, Chicago, Ill., assignor of fifty-one one-hundredths to Evert Rich, Chicago, Ill. Filed Oct. 16, 1902. Serial No. 127,535. (No model.)

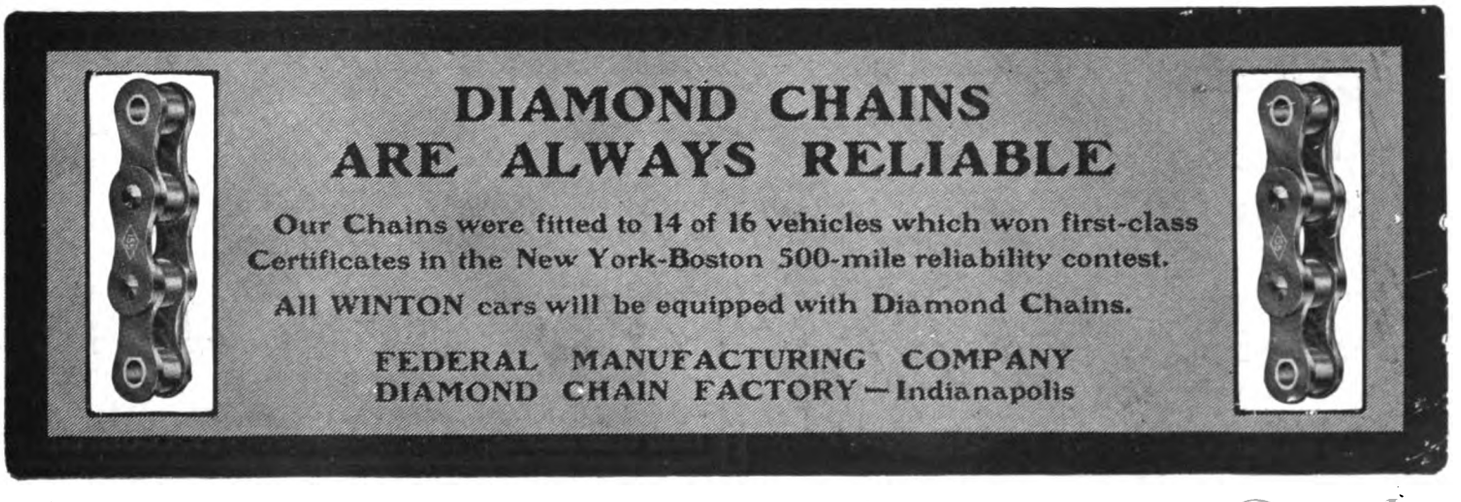
Claim.—1. A steam boiler composed of a plurality of units, each formed of two coils of pipe, the central or inner portion of the lower coil of each unit being continuous with the central or inner portion of the upper coil of each unit, while the outer portion of the upper coil of each unit is continuous with the outer portion of the lower coil of the adjacent unit, substantially as described.

719,425. Process of Making Self-Mending Tires. John W. Blodgett, Chicago, Ill., assignor to the N Tire Co., Chicago, Ill., a corporation of Illinois. Filed July 1, 1902. Serial No. 113,977. (No specimens.)

Claim.—The method of inserting a self-mending material in a pocket in a tire which consists in placing the deflated and flattened endless tube having the pocket therein in a trough-like mould whose available inner width is equal to the thickness of the entire tube at that time plus the desired thickness of the layer of self-mending material, said mould being heated to a temperature at which the self-mending material can be pumped; and in forcing the self-mending material heated substantially to the same temperature into such pocket while the tube is in the mould and until the pocket is filled at completely as the width of the mould will permit, substantially as described.

719,486. Carbureter for Internal-Combustion Engines. Frederick H. Messinger, New York, N. Y. Filed Oct. 19, 1901. Serial No. 79,225. (No model.)

Claim.—1. In a carburetter for internal-combustion engines, the combination with a vaporizing chamber through which the air is drawn upwardly, a vaporizing nozzle in said chamber, a fluid supply for said nozzle, a horizontally arranged partition in said chamber below said nozzle, air passages around said partition, and an opening in the centre of said partition in line with the nozzle for directing a jet of air upwardly upon the nozzle, substantially as set forth.



719,536. Vaporizer or Carburetter for Explosive Engines. Henry W. Tuttle, Philadelphia, Pa., assignor to John M. Scott, Philadelph'a, Pa. Filed Jan. 13, 1902. Serial No. 89,449. (No model.)

719,547. Explosive Engine. John Willoughby, Brooklyn, N. Y., assignor of one-half to George W. Bayley, Brooklyn, N. Y. Filed Mar. 26, 1901. Serial No. 52,924. (No model.)

Claim.—1. An explosive engine having two cylinders arranged opposite and at an inclination to each other and provided with feed and exhaust ports, pistons therein, a crank shaft and connecting rods extending between the crank shaft and the pistons, the said cylinders each having an air chamber and the pistons having supplementary parts working in said air chambers, to draw the air into air chambers and to force it therefrom, an air reservoir connected with the air chambers, and receiving compressed air therefrom, unobstructed passages leading from the air reservoir in opposite directions and connected with the feed ports of the respective cylinders, and a fuel reservoir connected with the passages leading from the air reservoir at a point adjacent to the cylinder feed ports.

719,562. Steering Gear for Automobiles. Alanson P. Brush, Detroit, Mich., assignor of one-half to Cadillac Automobile Co., Detroit, Mich., a corporation of Michigan. Filed Nov. 21, 1902. Serial No. 132,220. (No model.)

Claim.—In a steering gear the combination

Digitized by Google

with a steering pinion of a rack bar meshing with said pinion, a frame in which the rack bar reciprocates, and an eccentric bushing in said frame about the rack bar, said bushing cut away intermediate its extremities and having a limited rotation about the rack bar to adjust the rack bar against the pinion.

39,707. Automobiles and Parts Thereof. The Pan-American Motor Co., Mamaroneck, N. Y. Filed December 11, 1902.

The word "Panam." Used since June 1, 1901.

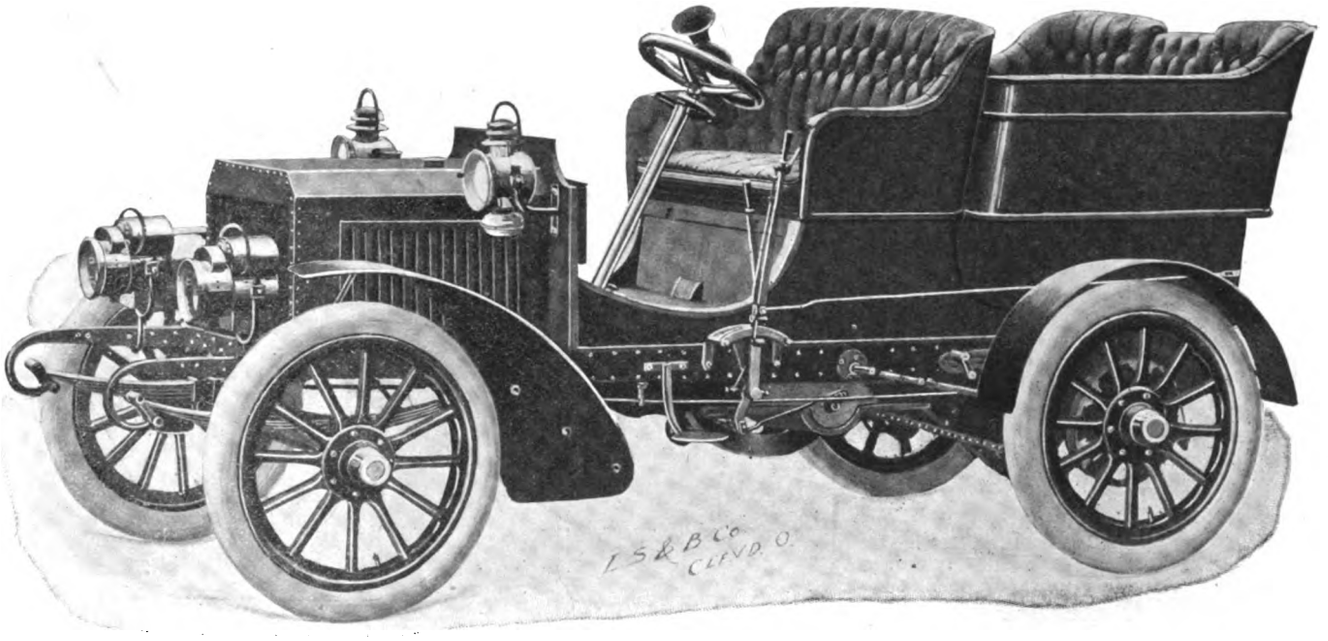
PNEUMATIC TIRES

The ORIGINAL and "MODEL" TYPES of SINGLE AND DOUBLE TUBE TIRE CONSTRUCTION

Appreciating the fact that requirements vary as to Single Tube and Detachable Tire Construction, we offer the most reliable of both types—*The Honest Standards.*

THEY WERE BEST YEARS AGO. AND YEARS OF INTELLIGENTLY PERSISTENT, CAREFULLY DIRECTED EFFORT HAS MADE THEM BETTER TO-DAY.



Where Quality is desired—where Comfort, Durability, and Protection against Annoyances is wanted—where All-'round Satisfaction is demanded—these tires should be adopted. Let us prove this to you by sending you signed statements from some of the most prominent makers and users in this country.

The Hartford Rubber Works Company, Hartford, Conn.

Digitized by Google

THE STEARNS CAR

Received a lot of very favorable comments at the show.

The style and general design is right. The motor is powerful, with a perfect throttle, and runs silently and with no vibration. The attachments on the dash and controls at the wheel are good points, too. The small tube radiator is ahead of the time, and considering all things, **STEARNS CARS are worth more than they cost.**

Cadillac Auto. Co. of Ills.,

Concerning Horse Power.

There were three engines of similar size and type to the

Rambler

exhibited in motor carriages at the recent New York Automobile Show. Their makers claimed for them respectively, seven and seven and a half horse power. That claimed for the

Rambler

is six brake horse power. There were four engines of ***SMALLER*** size in similar types of carriages, all claiming ***GREATER*** horse power than the

Rambler

There were two tonneaus, carrying four or more persons, with ***SMALLER*** engines, but each claiming more horse power than the

Rambler

All of these engines are of the medium speed variety, and tested—when they are tested—under the same conditions and with similar apparatus. Excepting only the body, tires and spark coil, every part of the

Rambler

TOURING CAR is made in our own factory, subject to every test and supervision that experience has suggested. Every engine is tested before being assembled in the carriage and it is impossible to build a better or more powerful engine of its type and size than used in the

Rambler

Is it necessary to say any more about horse power?

The Oldsmobile

NOTHING TO WATCH BUT THE ROAD.

PRICE, with Mud Guards, $650.00

EXPERIENCE vs. EXPERIMENTS.

The motor is the one great essential of the Automobile, and 23 years of gasolene motor building enables us to put into the Oldsmobile all the practical knowledge possible to get from EXPERIENCE.

The successful record of this pioneer Runabout has led to many untried machines being placed on the market. These will be sold to unwary purchasers, and after the test of use has shown the manufacturers their mistakes they will try more EXPERIMENTS.

Do you want a machine that has proven its reliability by three years' hard service, or do you want an EXPERIMENT ?

Volume V. New York, U. S. A., Thursday, February 19, 1903. No. 21

BUYS GASOMOBILE PLANT

Pan-American Will Manufacture in Marion, N. J. but Will go Slowly, Says Scarritt.

The Pan-American Motor Co., has purchased the remainder of the property formerly belonging to the Automobile Co. of America, located at Marion, N. J. It consisted of the ground and factory buildings, and the price is understood to have been $100,000. This is a sequel to the purchase a few weeks ago of the machinery, stock, etc., of the defunct Marion concern.

As a result of this purchase the Pan-American company is gradually closing out work at the Mamaroneck plant and transferring its effects there to Marion. It is the intention to concentrate at the latter place, and for the present, at least, manufacture the Panam car there.

To a Motor World man President W. E. Scarritt of the Pan-American company said on Tuesday when asked for a confirmation of the report:

"Yes, we have acquired the property. You see, it is this way: The stockholders of the two companies are closely connected in a business way. It seemed advantageous to make this deal, and it has gone through, although with a proviso. It awaits confirmation by Mr. Bostwick, who is now in the South on his yacht and will not return until April."

"Has the title to the property passed to the Pan-American company?" he was asked.

"Yes, title has passed; but it must be confirmed by Mr. Bostwick," was the reply.

"Do you propose to manufacture the Panam at Marion?" Mr. Scarritt was next asked.

"Such is our intention. We are preparing to close down at Mamaroneck and to devote our energies to the work at Marion. In fact, we have no intention of securing any other factory—at present."

In reply to the inquiry as to the extent of the business the company expected to do this season Mr. Scarritt said:

"You have probably noticed that we are not advertising. Neither are we looking for business. We could sell many times the number of cars we shall turn out this year without effort of any kind. What we are trying to do is to build one car perfect—as near perfect as is humanly possible. That done we shall make ready for next year."

Phelps is Reorganized.

Announcement is made that the newly organized Phelps Motor Vehicle Co. has acquired the property, patents, etc., of the Phelps Motor Co., of Stoneham and Boston, Mass. The manufacture of vehicles under the Phelps patents will be continued at Stoneham, as heretofore. The officers are as follows: President, Elliot C. Lee, of Brookline, Mass.; treasurer, A. T. Harris, of No. 28 State street, Boston; general manager, L. J. Phelps, of Melrose Highlands, Mass. The treasurer's office is located temporarily at No. 28 State street, Boston.

Lewis's Death Causes Changes.

Owing to the death of P. C. Lewis, of the Automobile Headquarters, Boston, Mass., formal notice of the dissolution of the partnership existing under that name has been given. The firm's affairs will be settled by Orpha O. Lewis, while Ralph C. Lewis will conduct the business under the same name and at the same place, No. 66 Stanhope street. The two partners of P. C. Lewis, George G. Reed and Arthur P. Underhill, will open a store and repair shop at No. 41 Stanhope street.

Auctioned off Remington Remains.

Pending the efforts to reorganize the Remington Automobile & Motor Co., the property of that concern was sold at auction at Utica, N. Y., last week. John B. Wild bid it in on behalf of the company. Two lots were put up, and were knocked down for $7,500 and $1,200, respectively.

Close Will Make Cars.

The Close Cycle Co., Olean, N. Y., will manufacture automobiles also. They are at work on a car that will be ready for the market in a short time.

WILL ABSORB DURYEA

His Patents Acquired and New Company Now Negotiating for his two Factories.

An undertaking of large scope came to the surface last week when a temporary organization was affected of the United States Rapid Vehicle Co., of this city. Temporary quarters were secured at Nos. 7 and 9 Warren street.

The concern has for its objects the acquisition of the patents of Charles A. Duryea, and the manufacture—ultimately on a very large scale—of cars built in accordance with them. One hundred of these cars, to be equipped with the Duryea three cylinder motor and transmission gear, but in other respects to differ materially from the well known Duryea designs, are already under way. It is expected that they will be ready for late spring delivery. These cars will carry two or four passengers, being designed with a disappearing front seat, which, when closed, will have the appearance of a bonnet. The price will be $1,200.

The present company was formed largely to prosecute the work on these cars and to make a start. The capital is $100,000, and the officers are Francis D. Carley, president; Charles E. Duryea, vice-president, and Henry Van Arsdale, secretary and general manager.

It is a part of the project, however, to acquire the Duryea companies at Reading, Pa., and Waterloo, Iowa, and to float a company with an immense capital by offering the stock to the investing public. Francis D. Carley, who will be remembered in connection with former automobile stock flotations, is back of this end of the plan. It is understood that while public subscriptions are earnestly desired, the floating of the company is not dependent upon them.

The company's temporary offices are in charge of Secretary Henry Van Arsdale. To a Motor World man who saw him on Wednesday he said:

"Everything that has been done is of a tentative nature. We do not know yet what the name of the company will be. Until Mr. Duryea returns from Chicago nothing in this connection will be known. I have simply been installed here with power and funds to get the work started on the first one hundred cars."

START MAY BE VEXATIOUS

So Many Entries in Paris-Madrid Race That a new Problem Results—Day of Rest Proposed.

French Bureau Motor World.
2 Rue d'Abbeville.

Paris, Feb. 6.—The entries for the Paris-Madrid motor car race, which is to take place on May 24, are coming in steadily, and have already nearly touched a hundred, although the actual course which the competitors will follow has not been definitely decided on. There will undoubtedly be much larger numbers of starters than in any road race hitherto organized, and the question of the length of time occupied by the starting will soon become a very serious one. The two minutes which are allowed between each competitor will have to be reduced to one minute or even less, for in th Paris-Vienna race from three to four hours were occupied with the start, and in the Paris-Madrid there are likely to be upwards of two hundred starters, in which case it will require from six to seven hours to start them all, and the last starters being under the serious disadvantage of only being able under the best conditions to reach the end of the stage by nightfall. It will also necessitate the controls being kept open very much later and strict attention paid to the times of the late arrivals, for it may be quite possible for a winner to arrive at sundown, when generally the controls become somewhat disorganized.

As far as the Spanish frontier the route has now been definitely fixed, and it is on the whole very good. From Bordeaux the route will pass through Castets, Bayonne and Saint Jean de Ludy, reaching the frontier at Behobil. Here there is the bridge of Bidassoa and there is only a hundred yards distance between the French and the Spanish custom houses, so that the formalities can be carried out most readily without any delay.

There is a scheme before the A. C. F. racing committee for allowing a day's rest in Bordeaux, and it is quite likely that this plan will be adopted, for at the speeds at which motor cars can now travel the fatigue to the driver, who has to have his attention absolutely directed to the road, is very severe. A day's rest in Bordeaux will give the drivers a rest and enable the public to see the cars, which, of course, will be safely quartered so that they may not be tampered with.

After Bordeaux, and for the first time in the annals of road racing there is a stretch of 108 miles of road without any agglomerations, and, therefore, any restrictions. The highest speeds can be indulged in and there are sure to be some remarkable records made. Mr. Tampier, the popular timekeeper of the A. C. F., who has gone over the roads from Paris to the frontier, and made the selection which the racing committee has adopted, reports that all along the road there is the greatest enthusiasm with regard to the race, the authorities of the different towns and villages vieing with each other to facilitate matters and to have the competitors pass through their localities.

Revised Scoring for Reliability Runs.

Having drawn up a formula, the sub-committee of the Automobile Club of Great Britain recommends that the marking for the 1903 trials shall be as follows:

Trials commended that: (1) Marks shall be given for "accuracy of advertised horsepower," which is to be taken from the best performance of the car on any one hill; (2) three marks a mile are to be awarded for each day's run as reliability marks, deducting one mark a minute for stoppages, as before; 1,500 marks allotted for "cleaning, adjustments and replenishing," deducting one mark a minute, as usual, to apply to Crystal Palace deductions only; (3) marks—3,000 for reliability, 1,500 for cleaning, etc.; 1,500 for hill climbing, 500 for condition, 500 for speed, 250 for brakes, 250 for steering, 250 for silencer, 250 for vibration, 250 for dust, 250 for restarting on hill, 250 for vapor or smoke, 250 for appearance, 250 for accuracy of horsepower, and 250 for fuel consumption; (4) fuel consumption marks to be—full marks for thirty miles per gallon for car weighing one ton laden; marks for ten miles per gallon for car weighing one ton laden. Full marks for forty-five miles per gallon for car weighing half a ton laden: marks for fifteen miles per gallon for car weighing half a ton laden. (5) For price deduct from the grand total one mark for every £1 sterling above the minimum of the class at which the car is entered. (6) Hill climbing formula:

$$\frac{S \times (P + 6)}{(£ + 2{,}000)} \times \frac{A \times C}{N}$$

S = speed in miles per hour on hills; P = number of passengers carried; £ = price in pounds; N = the number of hills on which trials are held; A = the average gradient in percentage; C is a constant (?17). (7) Formula for speed:—

$$\frac{S \times (P + 6)}{(£ + 2{,}000)} \times 3{,}000$$

Looks Like Ireland.

Irish stock is rising. There is at last a real prospect that the Bennett Cup race will be run in the Emerald Isle. Cable dispatches from London, under date of Tuesday, state that the Hon. J. S. Montagu, who drew up the bill which will be submitted to Parliament authorizing the race, was informed by the Premier and the Chief Secretary for Ireland that the government is heartily in favor of it, and should any opposition be offered, which is not anticipated, the government will use its influence to overcome it.

That this practically assures the holding of the contest in Ireland is the view taken of the matter in Great Britain.

CONTEST WILL GO ON

Automobile Club Ignores Manufacturers' Queer Objections and Makes First Formal Move.

It became apparent on Monday that the resolution adopted by the National Association of Automobile Manufacturers, declaring opposition to the holding of a contest for business vehicles, had not caused any commotion in the Automobile Club of America, let alone interfering with its plans. The contest committee of the club proceeded as calmly to go for vard with its arrangements as if there was no N. A. A. M. in existence. Only there was a subtle swerving in the direction in which the plans were being laid that was very significant.

Officially the club has taken no action on the resolution adopted by the executive committee of the N. A. A. M. and sent to the club, beyond acknowledging the receipt of the communication containing the resolution and the statement that it had been referred to the board of governors. The governors have not met since then, and probably will not do so until next week. Of course it has been known to the contest committee, however, all about the resolution and what the sentiment of the governors is concerning it, and undoubtedly the action of the contest committee in drafting a letter and sending it out to business concerns in New York City was "inspired" and is a foreshadowing of what the action of the governors will be with regard to the resolution.

It was said by a member of the club, who was quoted in The Motor World last week, that there was no reason why the club should not go ahead with its arrangements and let the manufacturers enter or stay out, as they liked. It would seem that this sentiment had been entertained by the contest committee when it drafted a letter which was sent to seventy-five business firms in New York, for the communication plainly manifests a decision to turn the back upon the would-be dictators in the N. A. A. M. and look to those who own and operate motor trucks and wagons for the filling of the entry lists. The letter sent out lays a peculiar emphasis on the fact that the contest committee is proceeding under instructions from the board of governors. It reads as follows:

"The Automobile Club of America, as you perhaps know, is an organization, one of the purposes of which is to encourage the introduction and use of all types of self-propelled vehicles. To this end the club has from time to time held contests for automobiles to demonstrate their reliability as a pleasure vehicle.

"The board of governors of the club have now instructed their contest committee to hold a contest in the spring, probably in May, for commercial vehicles of all types, including heavy trucks and delivery wagons.

Digitized by Google

as well as light delivery wagons, propelled by gasolene, steam or electricity.

"It is the intention of the club to determine by this contest whether the time has arrived when it can be satisfactorily demonstrated that self-propelled vehicles can be used in commerce at less cost and to greater advantage than the present horse-drawn vehicles.

"We believe that this question cannot fail to interest you, and the contest committee is anxious to secure the views of gentlemen who are in charge of the deliveries for large commercial institutions in the city, with a view of making the contest cover the ground most desired by the companies delivering goods in New York and vicinity.

"If your company would have the gentlemen in charge of your delivery department meet this committee at the clubhouse, 753 Fifth avenue, New York, on Thursday, February 19, at 4 o'clock in the afternoon, and talk over the matter, we think it would be of mutual interest.

"Will you kindly advise us whether you will send a representative, and oblige, yours truly, THE CONTEST COMMITTEE.

P. S.—We wish to learn what are the general requirements for a long as well as a short haul, and for both light and heavy vehicles."

The contest committee of the club consists of John A. Hill, chairman; Emerson Brooks and John R. Conklin.

Clement Invades England.

An industrial combination fraught with momentous consequences for the British automobile trade has been formed in England. The prime movers are M. Clement, the great French maker; the Earl of Shrewsbury, D. M. Weigel and Charles Garrard.

M. Clement may be said to be the head of the automobile industry in France, and is largely interested in the firm of Panhard & Levassor, Clement-Gladiator and in the Clement Cycle and Light Carriage Co., in this country. The Earl of Shrewsbury is one of the shrewdest and most enterprising business men in London; Mr. Weigel, who has been associated with the Earl of Shrewsbury for some time, is a man of great ability and energy, and has made himself thoroughly master of all that pertains to motoring; while Mr. Charles Garrard has already given proof of his engineering abilities in connection with his own business in Birmingham. Gigantic works are being laid down, and the new combination will undoubtedly occupy an exceedingly important position in the English trade.

First Run Called Off.

On Tuesday, when all the night before the north wind had blown and it was known that it "had snown," the touring committee of the Automobile Club of America decided to call off the run to Philadelphia and back, which had been announced for this coming Saturday, Sunday and Monday. It was concluded that not so many as a corporal's guard could be induced to start

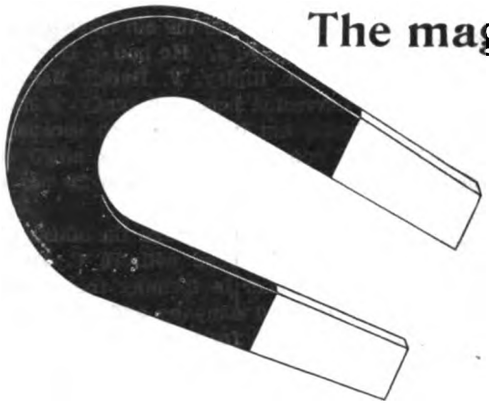
NAPOLEONIC CLEMENT

Engages Norris Mason as American Manager and Outlines Far-Reaching Plans.

A deal of magnitude that promises to completely change the condition of affairs in the United States with regard to several of the best known foreign machines has been consummated, and its workings will begin to be seen in April. A. Clement, who without question is the man with the biggest and the most extensive automobile interests in the world, concluded while he was here to launch forth in America in a way that is apt to affect seriously the concerns now dealing in three well known French machines.

As is known to some persons, M. Clement has a one-quarter interest in the Panhard factory, a one-third interest in the Mors establishment, and a one-third interest in the Renault concern, besides owning the Clement automobile factory at Levallois, the Gladiator and Clement bicycle plants, in Paris, having an interest in the manufacture of Michelin tires and being the senior partner in the famous body building firm of Clement & Rothschild. With his connection with the Mors, Panhard and Renault factories, M. Clement can obtain machines direct from them, and now has options on deliveries from them. As is well known in the trade, the French machines now received here travel first through the hands of several agents before they reach the American dealer. M. Clement being able to deal direct with the factories, as other dealers here are not, calculates that he can sell Panhards, Mors, Renault and Clement machines less the amount of several commissions. This he has decided to do.

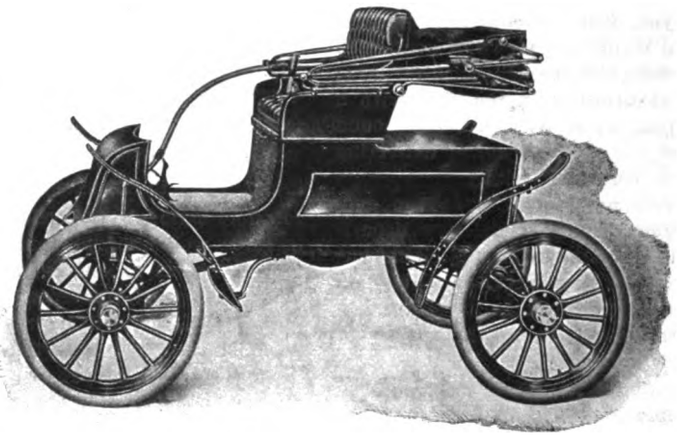
While here M. Clement engaged Mr. Norris Mason to be the manager of all his interests in America, including his factory at Bridgeport, Conn., where motor bicycles are now being made and where he contemplates building Clement motor cars for 1904. Mr. Mason was until recently the chief room clerk at the Waldorf-Astoria. He is a young man from St. Louis, only twenty-six years of age, and yet a pushing, capable business man, with manners well calculated to win success. He is not strange to the automobile business, as might be inferred from the position he held at the Waldorf, but is thoroughly familiar with motor cars and well acquainted with the people who deal in them. During the three years he was at the Waldorf Mr. Mason established an enviable acquaintance with the representatives of foreign factories who came to this country, and also with the wealthy men in this country who are the buyers of expensive machines. In this way he became acquainted with M. Clement two years ago. He also formed the acquaintance of MM. Duplan, Lucas, Charley and other French automobile men. He became best acquainted with M. Clement and his partner, M. Lucas, through having tried to put through a deal to have Panhards manufactured here in the old Gasmobile factory at Marion, N. J. He had J. H. Flagler, Sidney Dillon Ripley, V. Everit Macy and others interested here and ready to finance the scheme, but it fell through because the Panhard company wanted too much cash, too much stock as a gift and 20 per cent on the machines besides.



Later Mr. Mason, through the offices of M. Ernest Cuenod, joined with H. C. Tuxbury and Alex Fischer in forming the American Georges Richard company and obtaining the exclusive control for those machines in this country. With his partners, Mr. Mason has been selling the Georges Richard machines here for a year past, and it was through him that Barry & Hayes, of No. 35 East Fifty-eighth street, obtained the New York agency for them.

A Motor World man had a frank, interesting talk with Mr. Mason on Tuesday night just before he left New York for a visit to the Clement factory at Hartford. He left the Waldorf-Astoria some time ago, and has entered actively upon his duties as the American representative of the great Clement. From Hartford he goes to Chicago, and on next Tuesday he sails for Europe on the Crown Prince. He said:

"We have rented a place at No. 12 East Twenty-seventh street, which will be opened as the New York headquarters as soon as I get back from France. The store in Twenty-seventh street is 30 by 45 feet, and we will have two floors. The interior will be entirely remodelled, and work has begun on it already. When I return I will bring with me a couple of the latest Mors machines and one or two Renaults. Toward the end of April the younger brother of Lamberjack, the chauffeur, who was here during the show and who is a promising racing man himself, will come over with two new specially built Clement racing cars of 60 horsepower each and race them here, challenging every prominent racing man in this country.



"W. G. Allen, the head of the Hartford factory, is going to France with me, and I will spend a month in the Clement factory at Levallois studying every detail in the construction of the Clement car. About the manufacture of Clement cars here, that has been proposed, but it is not settled. The new factory in London, in which Lord Shrewsbury is to be a partner with Mr. Clement, is to be opened about April 1, and I am going to stop there on my way back. This new factory will take so much of the time of M. Clement that M. Lucas, his partner, is opposed to the idea of beginning to make cars here, so we may for a while yet do only a business in imported cars. M. Clement is a most particular man about the thoroughness of work and the finish of everything. He must inspect every new car himself. He would have to see any car turned out in America, and when he was here he said that if the cars built here were not in every respect equal to the French product they would be broken up and thrown in the scrap heap and a new start made. That is the sort of a man he is. He is enterprising, and cares nothing for the expense if only he can get everything just so. He has spent $4,000,000 in the last two years for new machinery. He spent $250,000 while he was here this last time with Brown, Sharpe & Co. for machinery,

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, FEBRUARY 19, 1903.

Action of the Right Sort.

Well done, Automobile Club of America!

The issue between the manufacturer with selfish ends in view and disinterested promoters of competitions, having in aim solely the benefit of the industry and the sport at large, was sure to come. It came when the manufacturers endeavored to prevent the holding of the contest for business vehicles which was projected by the club. It was made quite squarely by the executive committee of the National Association of Automobile Manufacturers, and it is to be as squarely met by the club. This is made plain by the letter of the contest committee which was sent out last Monday to seventy-five business firms in New York city, and a copy of which is printed on another page. The board of governors have taken no action in the matter as yet, but an indication of what their course will be is sufficiently furnished by what the contest committee have done.

The letter sent out may be considered al most as a definite snub for the N. A. A. M., and the sympathies of those familiar with the history of events in connection with the proposed contest will be wholly with the club. Before making any definite move in the matter, the contest committee invited all the manufacturers to meet with them and discuss the project. Nothing could have been more considerate and polite than this course. At that meeting was the time for manufacturers to make their protests. That would have been the gentlemanly course. Instead of there being any objections raised there was a general approval of the project by the manufacturers at their meeting with the contest committee. The strange and suspicious circumstance is that several of the same concerns represented at the first meeting, where approval of the contest was given, were present also at the meeting of the executive committee of the N. A. A. M., when the resolution opposing such a contest was adopted. This made it look as if some one or ones with an axe to grind could manipulate the N. A. A. M. On the whole it is not surprising that the club should consider the sending of the resolution to it as an impertinence. It would have been better if the N. A. A. M. had been satisfied with letting the resolution go on record as one of the minutes of the organization, and refrained from sending it to the club, as if it were something which the club should heed.

The contest committee has acted wisely and with commendable firmness. It is to be hoped that the policy of the club will be always as clearly defined as it has been in this matter.

It is not the general policy of the Motor World to arrogate credit to itself. Probably the committee would have recognized of itself the fact that the users of motor wagons and trucks are the ones from whom entries must be sought, which was pointed out by the Motor World some time ago, at the same time that it was explained why a part of the course should be through city streets, but it is gratifying to note that what was suggested agrees with what is being done. The manufacturers of power trucks and wagons build to order, and few of them have any spare cars to enter in a contest. Cars that have seen service will, moreover, give a better account of themselves than new ones.

It will be of decided benefit for the firms who use motor delivery wagons and trucks to have it advertised by a public contest that they are progressive enough to do so, and of greater benefit to the successful competitors for it to be known that they have the most efficient cars of their type. For these reasons the business firms of the city should comply with the request of the club and should enter freely into the contest and the spirit in which it is given. In order that they may enter the lists and compete the contest should be held on a holiday, when the wagons will not be required for delivering goods, or perhaps a Saturday afternoon druing the early closing period after the first of June might do. It is probable that the new comers in the manufacturing field will be only too glad to enter, and that certain manufacturers will swell the lists. It does not matter whether the "Men-Afraid-of Rivals" do or do not.

It is time to bring the motor truck and wagon from the background.

Let the contest go on.

Ceylon vs. American Civilization.

To hold up as an example of equal and exact justice the ruling of a court in more or less benighted Ceylon is reaching far out, but the language of the Colombo magistrate is so pertinent and so like real justice that it would be well were it possible to brand the words on the brains of all those in highly civilized America who have to do with the making and the application of the law.

"Horsed carriages," said the Ceylon sage, "have no greater right to the use of the public roads than have motor cars, and it is not inconceivable that at some distant day they will be as extinct as are Sedan chairs now. I see no reason why the defendant in this case should be mulcted in damages than why the first man who used an umbrella in London should have been assaulted by the mob as he was. The defendant was driving a legitimate vehicle in a legitimate way, and I cannot therefore hold him legally responsible for accident due to the timidity of the horse."

In America the man with the automobile is like the man with the umbrella—it is the fashion to assault him, and the mob is composed not of rowdies, but of "statesmen" in legislatures.

Merit That is not Appreciated.

For a vehicle that is peculiarly fitted to cope with snow and ice, the automobile has been singularly unfortunate in not having the fact brought home to the public. Fair weather vehicles most of them are. Used only for pleasure, when the skies are cloudless and the roads hard and dry, their own-

Digitized by Google

ers seem to lose sight of the fact that they are fit for all weathers. Supplied with tops or closed bodies, and with the engine and other parts properly protected, they are proof against the wintriest brand of weather found anywhere. When of the gasolene variety cold only makes the motor more efficient. Rain and mud, sleet, snow and ice, these interfere but little with their progress—certainly to nothing like the extent that similar conditions affect the equine drawn type. The fiting up of a coil or two of pipe furnishes ample warmth, and safely esconced behind glass walls, with steering and other levers within easy reach, the autoist is able to laugh at Old Boreas and his storm bearing companions.

On streets of sleet, as on snow encumbered ones, the motor vehicle rarely falters. The contrast between it and the horse-drawn kind, with the patient, pathetic brutes slipping and sliding, held to their work only by tight rein and mercilessly wielded lash, is eye opening. But it fails to accomplish all that it could, owing to the limited number of all-weather cars. Most of them are withdrawn at the first hint of inclemency. Were they used more, come rain, come shine, it would undoubtedly hasten the coming of the day when for all utilitarian purposes the horse will pass into "innocuous desuetude."

The Tilting Steering Wheel.

Frequently the simplicity of a device is apparent only after it has been invented. As it was with the egg of Columbus, it seems very easy, and everybody wonders why it was not thought of long before.

The tilting steering lever is a case in point. A year ago it was new, being seen on but one or two cars. It was even regarded with suspicion, many people believing that it would give trouble—was of the "freak" order, in fact. Where it was not adversely criticised it was viewed with indifference, and no feature seemed less likely to met with general approval.

There is no manner of doubt, however, that it has "caught on," and for a very good reason. It fills a want, and its popularity seems assured.

It is obvious that the operator of a car should be able to easily reach the steering wheel when settled firmly back in his seat. To do this would interfere with his ingress and egress, particularly if he be at all portly. In arranging wraps, when these are used, the wheel is also in the way. The greater slant given to steering columns further complicates matters, and altogether a considerable amount of inconvenience is caused. That it can be put up with is incontrovertable, for a very considerable majority of cars are still built with immovable columns and wheels, but no operator who has used a tilting wheel will go back to the old kind unless there is something unmechanical about the particular device used.

Trap the Motorphobes.

It was humanly natural that the automobilists who have been so persistently persecuted under the Cocks law by the Scudder brand of motorphobes on Long Island would retaliate some day, and it is calculated to cause a spasm of unholy glee in the bosoms of all automobilists to know that they have done so and have caught a number of horsemen at Seacliff "dead to rights" under the same Cocks law.

It is not to be recommended that automobilists should adopt the undignified, unmanly and contemptible tactics of hiding in the woods and lying in wait for unsuspecting horsemen and others who travel faster than eight miles an hour on the road, but turn about is fair play, and it would be a truly wholesome thing for some concerted action to be taken by automobilists toward an equitable enforcement of the law. There are probably a dozen horsemen and bicyclists who violate the eight miles an hour speed for every automobilists who does so. There would be plenty of material for the making of examples if the automobilists would for a brief time undertake to fight the cranks with their own weapons. To cause the arrest of a few farmers, pleasure drivers and cyclists would bring out strongly the absurdity of the eight mile restriction, and it might possibly lead the motorphobes to pause in their invidious selection of automobilists for victims.

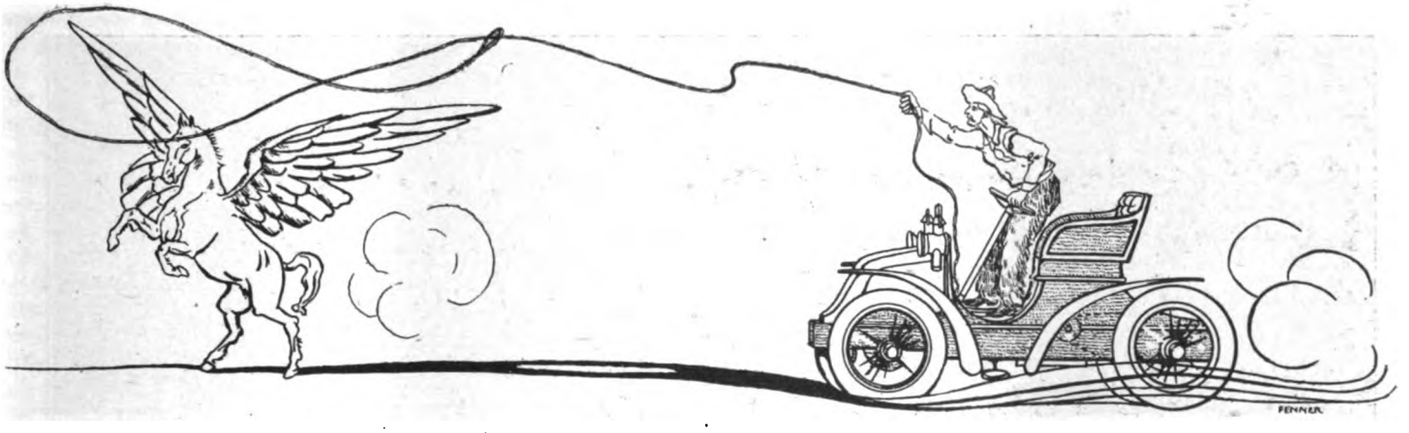
For Universal Lights.

It would probably be a waste of effort for autoists to object to carrying lamps. They would have to do so anyway. As a matter of fact, horse drawn vehicles are the only ones that are admitted to have an inalienable right to perambulate the public highways without lights. All other wheeled vehicles, to say nothing of every conceivable manner of craft that ploughs the water, must be provided with lamps.

It is just as well, therefore, that autoists are complaiscent. They admit the desirability, if not the necessity, of lights, and aid, instead of atempting to hinder, their carriage. Universal lights would be a more logical cry than lights for automobiles, and the day will undoubtedly come when they will be required. Then people will wonder why such a natural step was not taken long before, and the users of horse drawn vehicles will inquire why they were ever so stupid as to oppose a measure of such undoubted wisdom.

Come to think of it, we don't hear as much as we used to of the chronic habit of the automobile to break down 'steen miles from anywhere, and leave its hapless passengers in the lurch—or in the ditch, do we? The wits still turn their atention to the self-propelled car, but it is its swiftness, power, awe-inspiring qualities that appeal to them most. Being indicative of progress, we can afford to regard the change with equanimity.

The injunction to drive on the direct gear is getting to be more and more the slogan of foreign and other makers of big cars. It was inevitable that sooner or later energetic efforts should be made to avoid the enormous wastage that takes place with the usual systems of transmission. A big step forward has been made by the change referred to.



As a counter balance to the man who wanted to exchange an automobile for a graveyard lot, there is his fellow who advertises that he will trade a merry-go-round for a motor car. In face of this who can doubt the popularity of the mechanically propelled vehicle?

In his eagerness to have the Bennett Cup race run in France M. Georges Prade challenged the right of the British club to hold it in Ireland on the ground that Edge, the holder of the trophy, is an Englishman! In reply it is pointed out that Edge was born in Australia!

The annual game of tag, with the autoist as "it," has been started, and before the spring comes it is long odds that no state that has automobiles within its borders will be without its bill designed to legislate them out of use.

A Camden, N. J., paper pillories opponents of the Scovell automobile bill and a measure forbidding live pigeon shooting, holding that they are birds of a feather. Of a verity, this is the most unkindest cut of all.

SPLENDID AS A SPECTACLE; DOUBTFUL AS A MART

Chicago Show Falls Short of Anticipations, Buyers Being Few and Unfavorable Weather Keeping Down Attendance—Several New Cars in Evidence, also Several Out-Edisoning Batteries.

Chicago, Feb. 16.--It may be too early to pass judgment on the show which opened in the Coliseum here on Saturday night, but it is fair to say that unless it improves in several respects before the doors close next Saturday it will fall short of what fancy painted.

The incompleteness which marked previous shows marks this one; there are many vacant spaces, and delays in transit scarcely account for all of the vacancies, as several of them are chargeable to local and nearby space holders. The indifferent attendance both of the public and of dealers is also again a matter of remark. It may be that as the week advances, as was the case last year, the show will improve in these regards, and naturally the wish is father to the thought; but, writing this Monday night, there is small cause for enthusiasm or congratulation. Nothing is to be gained by disguising the unpleasant truth.

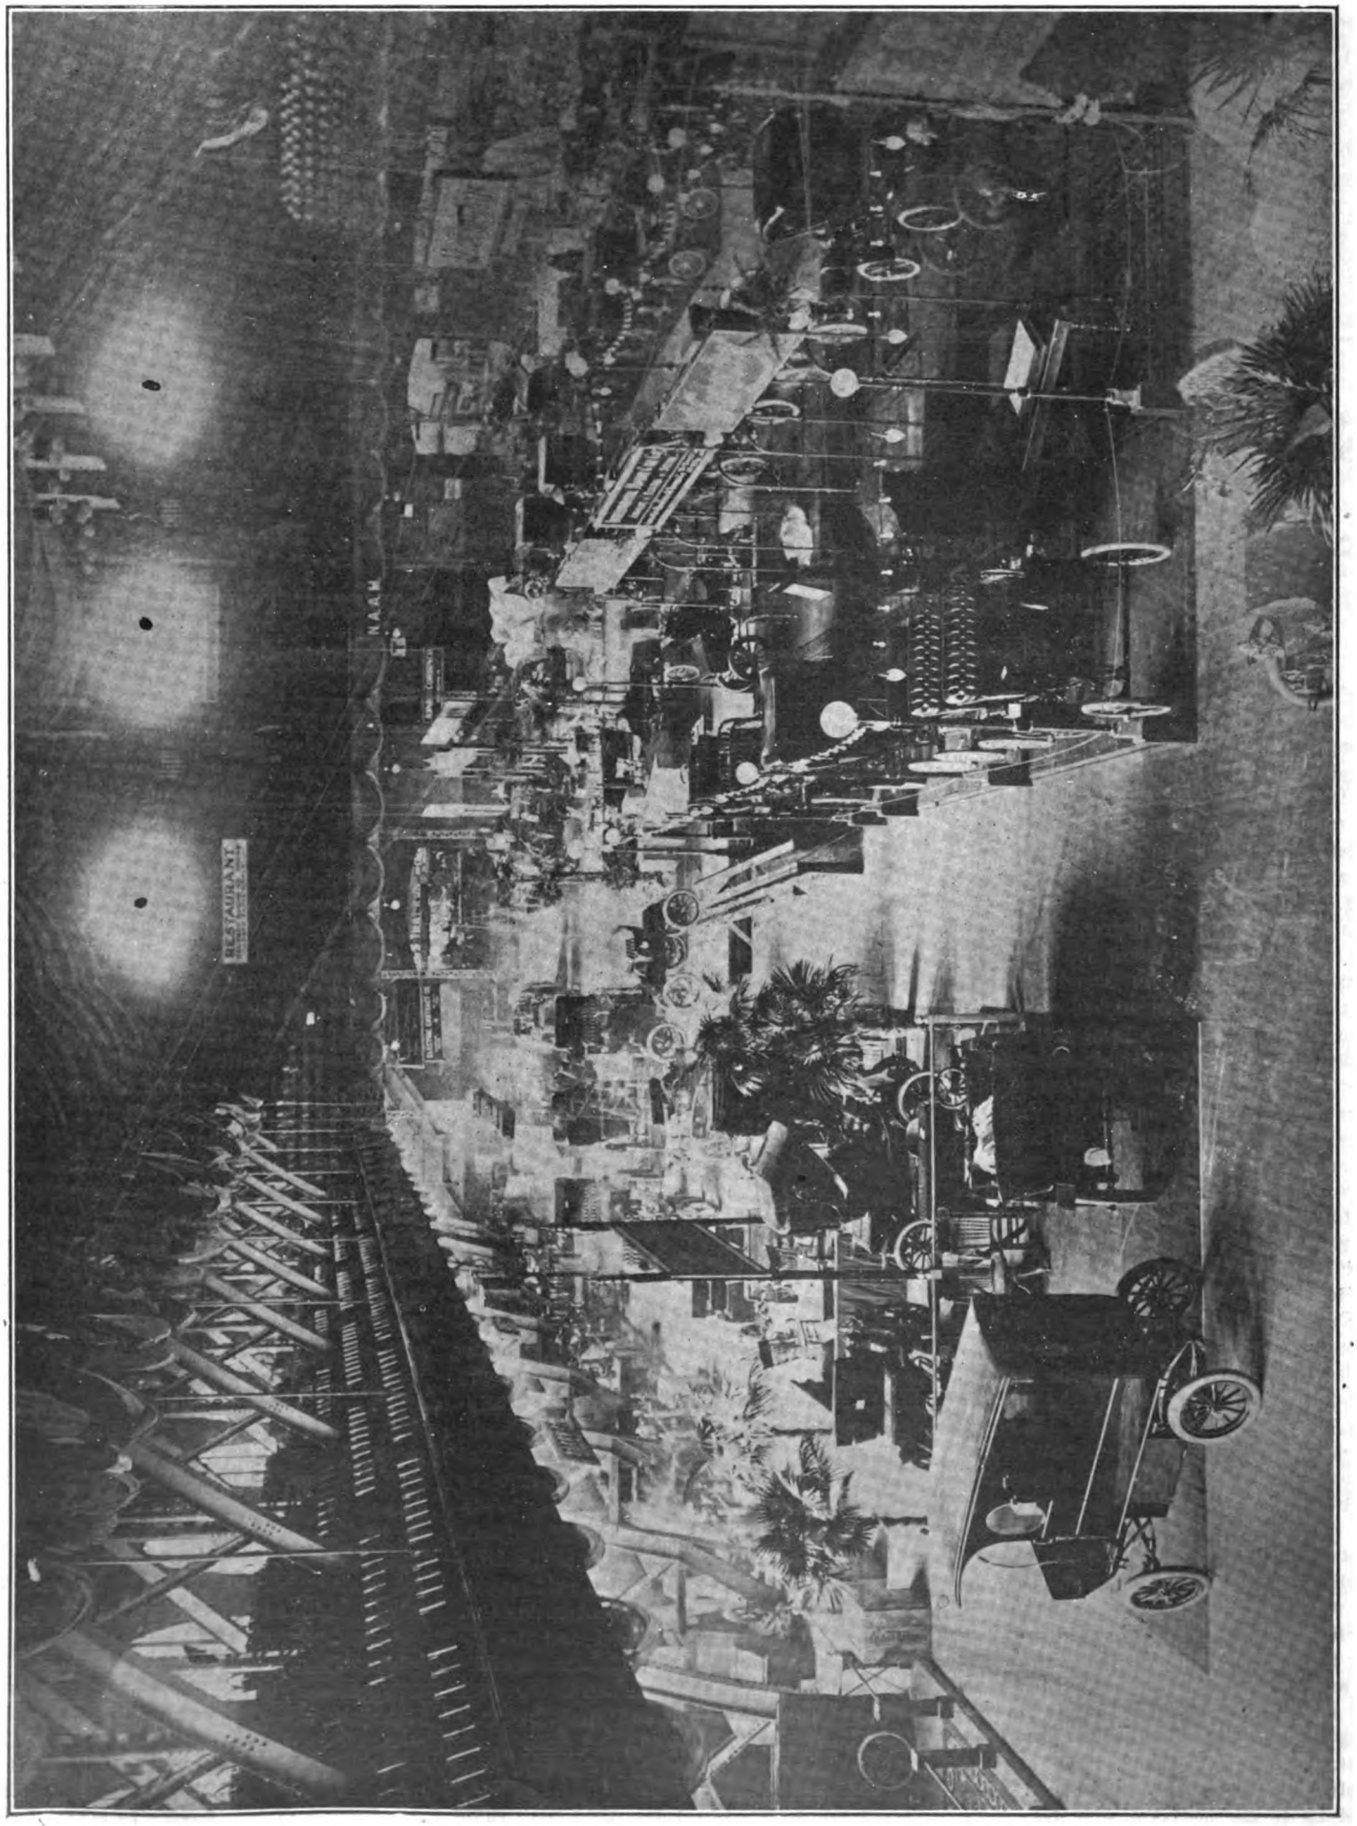
As a spectacle the show is far ahead of any ever held here, and compares favorably with the New York affair; in one respect, indeed, it is more impressive. The exhibits are not cut up or scattered; they are all on one floor, and as the management has this time not been content with bare rafters and walls, but has made a really pretentious effort at decoration, the general effect on entering the hall is distinctly pleasing. Green and yellow is the prevailing color scheme, looped streamers of those suggestive hues, from which American flags are pendant, concealing the roof of the hall, while the same colors and groupings of flags of all nations on the sides of the building add to the eye pleasing effect of the exhibition. The Chicago papers, which hitherto have been, if not unfriendly, then very lukewarm, have warmed up to the occasion, and are giving the show columns where inches were previously its portion. This increased publicity has not, however, materially increased the attendance, which would seem to argue that Chicago is not yet what may be styled "a centre of automobile interest."

In round numbers, there are 150 exhibitors here, including practically all of the cars that were shown in New York; the most notable absentees are seven foreign exhibitors who showed there but who did not come West. In exact numbers there are forty-four stands of complete cars that are practically duplicates of New York exhibits, and thirty-one displays of cars here that were not seen in the metropolis, all of them Western cars save the German Cudell exhibit. The only other foreign exhibitor is the Darracq Co. Of those that were in evidence in the East three, the Packard Motor Car Co., the National Motor Vehicle Co. and the International Motor Car Co., are exhibiting late additions to their line, the first named a Limousine car and the other two each an electric touring car.

While big touring cars are prominent, they do not dominate this show; the popular priced runabout still retains its popularity in the West. Gasolene, is of course, predominant, but there are more electrics here than at New York, and, incidentally, more electrical batteries. The latter really constitute a feature of the show, and the claims made for them—in the neighborhood of one hundred miles on one charge—are sufficient to make even Mr. Edison rub his eyes and thank his stars that the Western battery makers are lacking such press agents as are apparently at his command.

As the Motor World forecasted, friction driven cars constitute a minor feature of this show, and of those in evidence it is to be said of the Marble-Swift that it is not only ingenious mechanically, but is beautifully made and finished. The Chicago hot air car is also here, and is an exhibit that excites wonder, although it has not advanced since last year, and the claim that it requires "only" fifteen minutes to heat the air and thus start the motor is still made with charming innocence. There are several other kindred "wonders" also to be found.

The Wisconsin Wheel Works, that made their debut here as automobile manufacturers, did so with two striking runabouts, one at $600, the other at $850, and, what was more surprising and of which there was no hint, they are using two cycle motors. They also show another unexpected product, a motor bicycle with a two cycle motor; this in addition to their two other models of the standard four cycle type.



The other most remarkable development of the show is the $3,500 touring car exhibited by J. L. Tincher, which, among other things, incorporates an air brake.

Of the vehicle makers who engaged space but whose booths are still vacant are Matheson, Wick and Speedwell. In addition there

---

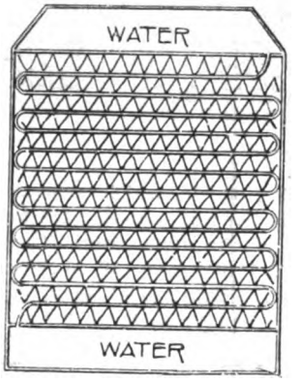
Chicago, Feb. 18 [By wire].—The show gives no evidence of improvement. The snow and stinging cold weather are keeping down the attendance, and out of town buyers are not sufficiently numerous to account for any considerable volume of sales. The management has, however, issued an order permitting the operation of motors within the building, and the result is noise and action that add to the life of the affair.

Digitized by Google

GENERAL VIEW OF THE CHICAGO SHOW.

Digitized by Google

are a number of accessory makers in the same category.



In addition to those already noted, all of the "old reliables" of the trade are here, however, and displaying their cars to good advantage—Olds, Electric Vehicle Co., Winton, Moyea, Searchmont, Locomobile, Baker, Autocar, Haynes-Apperson, Yale, Crest, Cadillac, Rambler, Northern, General, Stearns, Conrad, Thomas, Prescott, Pope-Robinson, De Dion, Elmore, Peerless, Shelby, Stevens-Duryea, American and Long Distance. The best known tires, Diamond, Hartford, Dunlop, G. & J., Fisk and Goodrich, are, as always, prominently in evidence, while Solar lamps, Veeder odometers, Whitney chains, Standard electrically welded parts and Kelly generators, Funk lamps and horns, Splitdorf coils, all well known standbys, are displayed and contribute to the completeness of this show, as they contributed to the New York function.

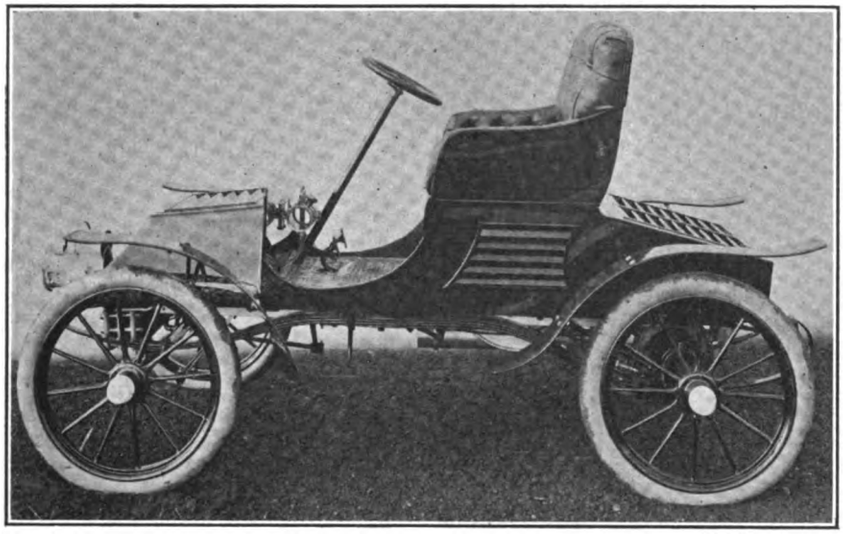
These concerns and their wares, and the features of the wares, that were not previously in evidence at the New York Show are as follows:

National Motor Vehicle Co., Indianapolis, exhibit in addition to their runabouts and surreys, a fetching electric touring car with tonneau attachment that was not shown at New York. It follows closely the lines of the gasolene cars, having a bonnetted front and being a wheel steerer. It has four speeds both ways; front lever brake on rear wheels; springs half front full rear; artillery wheels, 32x3½; foot plunger cut-out; control handle left seat with button for reverse; the motor and differential are inclosed within one dust and waterproof case, which forms part of the rear axle housing. The batteries are divided—sixteen front, twenty rear. At its price, $1,000, this car should not want buyers.

The Packard Motor Car Co., Warren, Ohio, are showing the cars that were at New York and in addition a Limousine model that would probably cause the Frenchmen to scratch their heads. It has an armored frame, half eliptic springs, artillery wheels, 34x4, French bonnet; four upright cylinders, bevel gear shaft drive, four speeds and reverse; side levers for speeds and emergency brake; pedals for clutch and brake; automatic intake with throttle on intake poppet stems; forced feed lubrication; motor on sub-frame; squared radiation coil placed low down in front.

National Automobile and Motor Company, of Oshkosh, Wis., show two particularly attractive cars, one a $1,450 light touring car, with a tonneau attachment, the other a full touring tonneau car at $2,500, the latter carrying an option on either surrey or tonneau rear. The former has a 72-inch wheel base, and the latter a base of 86 inches. Both types have angle iron frame, supported on semi-elliptical springs. Two cylinders giving 8 H. P. are used n the light car, and four cylinders, giving 16 horse power, on the large model. The motors are of the upright type. Transmission is through sliding gear, three forward and a reverse, running direct on the high speed to a bevel gear driver with spur differential. The drive is controlled by a hand lever at the side of the steering column. The bevel pinion of the driver has front and rear thrust bearings. At the back of the bevel gear is a roller that acts as a bearing to prevent any spread of the pinion and gear due to driving thrust. On the column carrying the driver control lever are the controls for the air carburetter and the spark. Steering is by wheel, through worm gear attached to the upright post. There are three foot pedals, for reverses, the clutch and the brake on the drive shaft. The action of the brake throws in and out the cone clutch at fly wheel. The emergency brake on the rear hubs is operated through a side lever. Cylinders are 4-inch bore and 5-inch stroke. Cylinders and valve housings are cast in one piece on both sizes. One half-time shaft operates both intake and exhaust valves. The main

NATIONAL COOLING COIL.



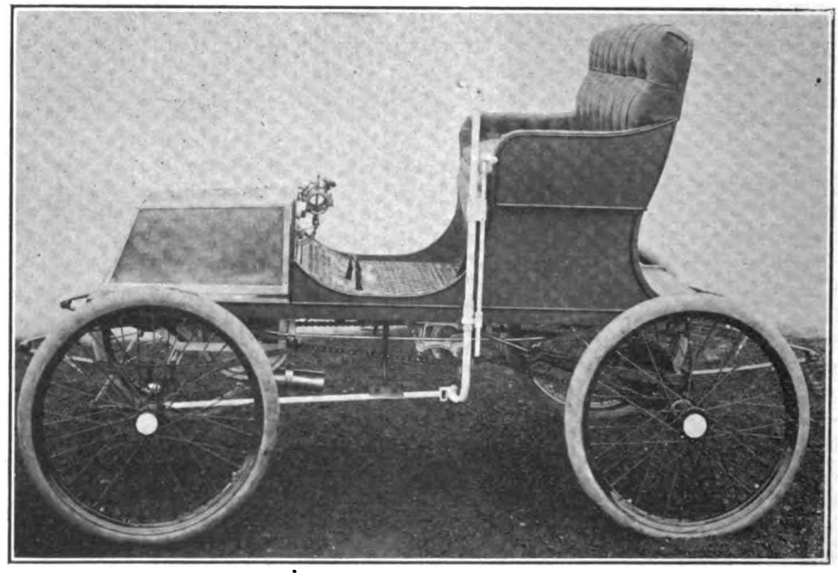
crank shaft has bearings between each crank. All take-ups are easily reached by removing a plate that opens the entire side of the crank case. Large brass cap screws are removable to take out the valve poppets. Ignition is by jump spark, with shifting cam for the contacts. On the half-time shaft is a ball type governor that controls the speed of the engine by throttling the mixture feed. For each two cylinders a separate exhaust pipe runs to the muffler, having a cut out for use when desired. Lubrication to cylinders is by a rotary pump placed above the cylinders and driven by a chain off the motor shaft. Crank lubrication is by splash. Float feed carburetter, made in aluminum, with but one lever, for air; gasolene regulation is by thumb screw for varying quantities. Something new in water radiator is shown on these cars. The shape is of the new upright flat box type, and it is made up of a number of one-eigth inch brass tubes, laid side by side. Each pipe runs complete from the top to the bottom water radiators, weaving back and forth in parallel lines, making half turns at each side. Each pipe thus bends back on itself, and has only two soldered joints, one at the top and the other at the bottom tanks. Between the parallel coils are placed sheets of brass bent to a herring bone line. This construction gives a larger number of thin circular water streams well separated for the action of the air circulation. Back of the radiator is a fan. The gasolene tanks hold twelve gallons, and the water tanks eight gallons. Water circulation is by rotary pump. On the light model 30x3 inch wheels are used, and on the larger car 32x4 are the sizes. Full regular equipment of lamps, horn, tools, etc., are included in the prices. All parts are standardized and made interchangeable.

T. L. Tincher, Chicago, exhibits a tonneau with individual seats, 2,000 pounds, $3,500. It is a wheel steerer and has four cylinder vertical engine with mechanical inlets, rotary pump, box steel wheel frame with hickory core, artillery wheels, 30x4; sliding gear, four forwards and reverse; side chain drive; one side lever; spark and throttle and air brake on steering column; square bonnet; pedal band brake; independent foot pedal for throwing out clutch; air brake mechanism is a compressor, run off motor shaft and works on internal expanding rings on rear hubs.

Fredonia Manufacturing Company, of Youngstown, Ohio, exhibit a runabout, a tonneau and a chassis, all with single cylinder horizontal gasolene motors. The runabout weighs 1,300 pounds, and is priced at $1,000. The tonneau figures are 1,450 pounds, and $1,250. The main frame is of 3-inch channel steel, supported by 1⅝x30 full elliptic springs. The channel is in one piece, starting from the clip of one of the front springs, running to the back, across, and then forward to the other front spring clip, giving plan resembling a large square U. A little more than half way forward is a cross channel tie-piece of the same section as the main frame. Connecting this with the rear cross section of the main frame is another 3-inch channel piece, running parallel with left side main channel plate and spaced about seven inches in the clear. In the parallelogram thus formed is placed the rearwardly pointing motor. To the right of the crankcase is the 200 pound fly-wheel, and to the right of this the transmission gearing. Back of the transmission are carried the gasolene and water tanks. A double back of flanged radiating coils is carried between the front springs. The chain drive running to the rear axle is in a line just inside the left side-frame. The pump is chain driven and bolted to the center cross channel plate. The engine is full 9 H. P., with a 5½x6½ cylinder case in one piece. The intake is automatic. In addition to the regular mechanically operated pappet exhaust, there is an auxiliary relief part which is uncovered by the piston at the end of the outward stroke, as on two cycle motors. This reduces both the pressure and temperatures at the completion of the working stroke, saving on the bearing thrust and reducing the scoring at the exhaust poppet seating. There are also other noteworthy features in this construction, such as quieter exhaust, lower temperature conditions at the water jacket, and less decomposition of cylinder lubricating oil.

Digitized by Google

The three main bearings and the half-time shaft running in generous sized phosphur bearings, are split at the top side, giving a simple take-up for wear by turning a cap bolt. Upton transmission is used, one lever controlling the two speeds ahead and the reverse. The carburetter is of the float feed type. Speed of engines is regulated by throttle and shifting spark cam. Jump spark



THE 7 H. P. TWO-CYCLE MITCHELL.

is used, the auxiliary exhaust materially assisting in keeping the plug from fouling. The three main bearings are fed from independent grease cups, and the cylinder from a sight oil cup. On the tonneau model the wheel steering column carries a side lever operating the two speeds ahead. The reverse and the brake in the differential are foot-pedal operated. The band brake is double, one band each side of the sprocket, and acts in both directions. Auxiliary band brakes are also provided. Front axle, 1¼ inch, solid forged; rear live axle on the rear hubs, also forged, 1½ inch, running in roller bearing boxes hung from the lower spring clips; front hubs run on roller bearings. Thirty-inch Sarvin wheels of Phineas Jones make, shod with 3-inch tires. Chain is one-half inch roller, 1¼ inch pitch, running on 9 and 30 tooth sprockets. Tanks are coppered steel, eight gallons for gasolene, and four gallons for water. Wheel steering is regular equipment on tonneau; on runabout option is given of side lever or wheel. The running gear is reachless; distance rods run to under side of rear bearing boxes; steel mud guards. Two oil lamps, a horn and full kit of tools are regular equipment.

Wisconsin Wheel Works, Racine Junction, Wis., show for the first time their Mitchell car complete, and in the chassis, also the Mitchell Junior and three models of motor bicycles, all of which have been awaited with considerable interest; they incorporated several surprises. The car sells at $850, and the Junior at $600. The large car carries a two-cycle single cylinder horizontal motor, rated at 7 brake horsepower, on the rear wheels at 800 revolutions per minute. The motor is carried in two cross angle irons that bolt to the side angle irons. These two side pieces run from a point over the front axle to the same position relating to the rear axle, and rest on long-leaf side springs. Toward the front these leaves taper away to the axle clip, and from this point on one leaf is carried forward and then is curved up to the swinging buckle, which connects it to a single fairly flat leaf running back to the forward end of the angle iron. Toward the rear the six leaves taper off to three, where they meet the axle block carrying the roller bearing, and these three taper off to a single up-curved leaf to meet the swing buckle. This buckle connects to one of three leaves which taper off toward it from their junction with the rear end of the side junction with the rear end of the side angle iron.

Planetary transmission is used, with two speeds forward and a reverse, driving direct on the high speed. The forward speeds are controlled by a lever at the outside of the seat. The reverse is through a foot pedal, as is also the braking. Steering is by wheel. Ignition is by jump spark, controlled by a small lever back of the speed lever; throttle is by lever between the other two. Below these is the gasolene control handle. The oiler is on the back of the dash, with three sight feed valves. One feed of oiling takes care of the entire transmission passing into the end of a hollow shaft. The flywheel is under the seat, which tips forward in hinges and is protected from oil by a brass guard. Tanks are of copper. Artillery tubular steel wheels, with 30 by 3 inch tires. The Junior has an angle frame resting on four full elliptical springs. At the forward section is a cross angle piece, and from this to the forward end plate run two angle irons, of smaller section as a sub frame, that support a four cycle air cooled motor, giving 4 brake horsepower at 1,400 revolutions per minute, placed in a diagonal position. The motor has an outside flywheel ,and is cooled by a fan. Over the motor is placed a bonnet of wire, woven to give a pleasing herringbone effect; sides, front and top are of this wire screen, with metal corner bands. Planetary transmission is used, with two speeds and a reverse, driving direct on the high. There are three foot pedals, controlling the reverse, the brake and the slow speed. Steering is at the side, the same column carrying a hand lever for the high speed. On the dash is a three way sight oiler, the spark controlling handle and the gasolene feed control to the carburetter. Wheels are of wire, enamelled, and are 2½ by 28 inches, with single tube tires. In motor cycles last year's model is shown, with detail improvements, and to this has now been added a two cycle model and a larger four cycle motor model, known as the Mitchell Mile-a-Minute; the latter is of 3½ horsepower, and is of unusual length, having a base of 55 inches.

THE MITCHELL, JR., 4 H. P.

Digitized by Google

Chelsea Mfg. Co., Chelsea, Mich., show a car with springs of the Olds type, motor on tubular frame from rear axle and leaf springs in front; shaft transmission; tonneau, 20 horsepower motor, two cylinder mechanical inlet valve on top of cylinder, operated by upright side shaft with worm drive. Transmission three frictionless spiral gears, two speeds and reverse; spur differential, brakes on each side differential; wheel steering with telescoping centre rod, giving any up and down position for hand wheel steering post at very acute angle running through dash and platform at side of hood. Mercedes hood and honeycomb radiator. Roller rear bearings front axle solid artillery wheels, ball bearing, 30x3½; speed controlled by throttle; fixed spark; throttles charged at determined speed. Foot button speeds engine up to limit; on release speed drops to throttle regulation. Change of gears by throwing side lever in any one of three positions, forward, high centre, low back reverse. Engine runs free beneath high and low, and reverse.

The Union Automobile Co., Union City, Ind., show a combination two and four-passenger runabout with drop front seat. Frame is made of 2½-inch angle iron carried on four ful eliptic springs. The engine is 6-inch bore and 4-inch stroke; 10 horsepower opposed horizontal cylinders and four cycle. Either touch or jump spark is used, regular equipment being jump. The engine sets crosswise at the rear and drives to friction wheel, giving the full range of speed on forward and reverse. The drive is by chain to a short counter shaft, and then back to a spur differential, the distance rod being attached to the bracket carrying the counter shaft. The engine control and speed shaft are carried on a post forward of the centre of the seat. Tension of the friction drive contact is controlled by a foot pedal. Wheel or lever steering. Braking is by foot pedal on the differential and for emergency the friction drive is thrown to the centre point and the tension foot pedal thrown full on. Water circulation is by gear pump. The ignition is by magneto, with dry battery for starting. The motor is started from the seat by a foot pedal connected by rods to a clutch on the shaft. The clutch has two dogs which fly back out of the way after the motor has been started. The friction drive has a composition plate on the fly wheel face to do away with the troubles found with frictioning on cast iron. The driving member has in the periphery of its wheel a pressed paper shoe to give noiseless contact. The main shaft has a ball thrust at each end. Automatic intake valves are used. A novelty in throttle control is placed between the carburetter and the intake. The control is through a tubular box in which is a tubular throttle valve, giving more or less of a port from the carburetter pipe to the throttle box. Inside this gate is a tubular cut-off operated by an eccentric on the speed shaft. This eccentric has the same amount of movement up and down at all times and running from full opening to a complete cut off. As the throttle valve handle is worked it interposes its cylindrical plate between the opening in the carburetter pipe, and the opening in the cut-off, to admit a full or partial charge as may be desired. Oiling is by compression through the crank box. Gasolene is carried in the back of the seat. Wheels are 34x3½ inches. Mud guards and enameled sheet wheels. Price, $450.

The Briscoe Mfg. Co., of Detroit, Mich., shows a very complete line of radiators, tanks, hoods, fenders and guards and mufflers and manufacture also the various articles in their make up. The hoods shown are of the French type, with taper sides and roll front, taper side with open front and of the square Mercedes type. Radiators are shown in the Olds type, in multiple figure S type with large tubes having flanged washers, also in grouped small quarter-inch pipes laid side by side and running through continuous air plates. A novelty in radiators is shown in a type that presents the appearance of flat plates set on the edge. The plates are about a quarter of an inch apart and an inch high, of any desired depth. These are grouped on a centre plate, extending up and down from same, and any number of these series can be put in a bonnet. The plates are hollow and of very thin copper, giving a large number of thin sheets of water.

Jackson Automobile Co., Jackson, Mich., show a touring car of 1,050 lbs, listing at $850. It has a 7-horse single cylinder, 5x6; mechanical intake, splash lubrication, rotary pump on engine shoft, coil under front bonnet, planetary transmission, two speeds and reverse one lever, foot pedal throttle, artillery wheels, 28x2½; ball front, roller rear; spur differential and chain drive, double band brake foot operated; hand wheel worm gear steering; angle iron frame, ¾ eliptical springs; also a light runabout, 650 lbs, $650; wood frame, four springs, ¾ eliptical; 28x2½ ball bearing wire wheels; air cooled opposed cylinder crosswise under front bonnet; side steering; direct shaft drive to differential; foot throttle; clutch operating handle on steering column; spark lever at seat side; foot pedal reverse; foot pedal brake.

C. W. Russell, Springfield, Ohio, shows a single seat touring car; four springs, ¾ eliptical; wheels 30x3½; frame, tubular of oblong section; horizontal 9 horsepower motor, throttle control and shifting jump spark magneto and dry batteries; throttle and spark lever on wheel steering column; worm steering; planetary transmission; three speeds and reverse, high speed from motor; gear pump to water radiator in front; forced feed lubrication.

The St. Louis Motor Carriage Co., St. Louis. Mo., show a tonneau body on which the tonneau is detachable, and in its place a cover is put forming a luggage box. The body is mounted on a channel iron frame with full elliptic springs in the rear and platform springs in front; 30 by 3½ inch wooden wheels are used, fitted with detachable tires and Timken roller bearings. The motor is a single 9 horsepower horizontal one of 5¼-inch bore by 6-inch stroke, under the seat, facing forward, differing from the usual position, which faces backward. It is water cooled by a gravity feed. The water and the gasolene tanks are placed forward under the bonnet, which is really not a bonnet, but a tank divided into two parts. A float feed carburetter is used. The transmission is by a shifting pinion system, all on one shaft, the transmission being integral with the motor, for which method it is claimed it is impossible to get the shaft out of line. The two forward speeds and one reverse are operated by one lever, another lever being used to release the clutch. The motor has a large flywheel of 24-inch diameter. A single chain drive is used to a differential live rear axle. Rear hub brakes are used, operated by a foot pedal and ratchet. The ignition is by jump spark and batteries, the batteries and tool box being contained in a water proof locker in the dashboard. The car weighs 1,600 pounds, and sells for $1,500. The whole construction looks as if their catch phrase, "Rigs that run," is justified.

The Jones Corbin Co., of Philadelphia, Pa., show an attractive bijou car with individual seats, the body being painted a cardinal color and having long brass fenders, which almost touch the ground, at the back of the rear wheels, and brass trimmings and three brass lamps to match. It has an angle iron frame with half elliptic springs supporting the body on body irons. The wheel base is 6 feet 6 inches, the wooden wheels fitted with 28 by 3 inch detachable tires. Wheel steering is employed, having the gas and spark levers on the steering rod. Roller and ball bearings are used throughout the car. The motor is an 8 horsepower De Dion of the single vertical type, under a bonnot in front of which is placed a Mercedes cooler carrying two gallons of water. The gasolene tank, which holds twelve gallons, is under the seat. Sliding gear transmission is used, with three speeds forward and one reverse, from a bevel shaft to a countershaft having a double chain drive to the rear wheels, all the speeds being controlled by one lever and the cone clutch being operated by a foot pedal. The ignition is by jump spark and dry battery. A friction drive pump is driven from the flywheel, and a gauge on the dashboard shows its operation. Automatic side feed lubricators are also on the back. Two rattan side baskets for luncheon or luggage are on each side of the seat. The car weighs 700 pounds and costs $1,000.

The Marble-Swift Automobile Co., Chicago, show a friction driven, Stanhope bodied car, having a channel iron frame with full eliptic springs in the rear, and half eliptic springs in front, 30x3 artillery wheels with G. & J. tires. The motor is of a vertical two-cylinder type, water cooled by means of a new cooler, which consists of 36 upright flat copper tubes 3x⅛ inches, and about 14

Digitized by Google

inches long, placed in the open front of the bonnet in front of the car. It contains 2½ gallons of water. The motor is connected to the transmission by flexible shaft, having a knuckle or tumble-shaft joint. The levers are used for controlling, one lever with a thumb latch for locking the lever in position, putting the friction drive into play; the other for changing the speed. A foot lever is also provided for operating. Wheel steering is employed, a support or parallel pillar being alongside the steering rod on which three small hand levers are grouped for advancing the spark, for throttling the air, and for regulating the mixture. The gasolene tank is most ingeniously arranged in the back of the seat, between the body and the cushion, a filler cap being provided on the top of the seat so as to fill it. This tank holds nine gallons of gasolene. The car weighs 1,500 pounds, and costs $1,500. A miniature working classis is shown. It is certainly a handsome and beautifully finished car.

The Chicago Moto Cycle Co., Chicago, show their caloric motor or hot air gas carriage with a single seated body, having the front of it shaped like the toe of a lady's slipper. It is mounted on four elliptic springs on a channel iron frame. Wire wheels with detachable tires are used. Roller bearings are used on the rear axle and ball bearings on the front. The motor is of a two-cylinder horizontal type, and is started from the seat by a ratchet and pawl which is connected to it by a cord and wooden handle knob. The cylinders are of 4-inch bore by 4⅝ stroke, developing 4½ horsepower at 400 revolutions. No electrical devices, carburetters or water cooling are used. Heat is applied at bottom of cylinder by gasolene flame. Air is taken in and compressed in upper cool end of cylinder, then transferred to lower heated end, where it expands and forces piston outward; the hot expanded air is then expelled from heated end at the same time another cool charge is taken at the upper cold end of cylinder, and the operation is repeated, giving an impulse every revolution. The constant taking in of cold air in top of cylinder and passing it down the inside walls of cylinder then exhausing from heated end keeps cylinder cool. As a combination air and gas engine, the operations are the same when working as an air engine, except that gas is taken in with the air. The explosion increases the power according to amount of gas admitted. Gas is made by passing supply pipe around exhaust valve. Engine responds as readily to gas valve as a steam engine to its throttle. When engine is using gas internally gas flame is not used externally. After bottom of cylinders are red hot (this takes ten or fifteen minutes) the engine starts. The transmission on the half speed is by a planetary system, the full speed is direct and the slow speed is by clutch on a counter shaft, the reverse being obtained by a combination of these. Lever centre steering is employed and the single hand control regulates the speed of the motor. The drive is by a single chain to a differential live rear axle. The carriage costs $800. A three cylinder motor is also shown.

The Lozier Motor Co., Plattsburg, N. Y., show a handsome white launch with solid mahogany deck and wood trimmings with all metal trimmings of brass. It is twenty feet over all, with a 5-foot 6-inch beam and drawing only seventeen inches of water when loaded. It carries fourteen passengers in the cock pit. Water tight collision bulk heads are carried in the bow, which also carry enough gasolene for a 400-mile run. The gasolene supply pipe for the motor is carried along the edge of the keel on the outside of the launch, a safety fire precaution. The motor is of vertical 2-cycle type, developing 3 horsepower to 400 revolutions, at seven miles an hour. The price of the launch is $675, a reduction of $50 being made when oak trimmings are furnished.

The Rapid Motor Car Co., Ltd., Grand Rapids, Mich., did not have their touring car on view up to Tuesday. It has an attachable tonneau listing at $3,000 and weighing 2,000 pounds, varying with the equipment. The frame is of angle iron, inside of which is a sub-frame carrying the motor and transmission mechanism, and supported on five half elliptic springs. Wheels are 32x4, artillery; the motor is 15b. horsepower, two cylinder, four cycle, vertical. Cylinders are 5x6, with brass water jackets. Ignition is by jump spark from friction-driven dynamo, operating at slow speed. Battery is supplied for emergency uses. Radiation by copper tubes, with copper pins in front of car between the springs. Circulation is by pump. Three speeds and a reverse operated by one lever through what is claimed to be a transmission of new design, providing three speeds and a reverse, operated with one lever. The gears are spur type and so arranged that only these under power are in motion. An individual wheel drive is used by means of which the rear axle is constructed in one piece. Drive is by chain. The differential is of the spur type located on the counter shaft. Band brakes are on the rear wheels and on the counter shaft. They may be operated by either the hand lever or a foot lever, the hand lever locks at any point. Interlocking wheel steering is used. The equipment includes one large acetylene headlight, two oil side lamps, one oil rear lamp and brass horn with flexible tubing.

Auburn Automobile Co., of Auburn, Ind., show a neat looking car with a square but distinctly pleasing bonnet front, giving ample storage space, and attachable tonneau. The frame is of 3x1½-inch angle iron, resting on four ½-elliptic springs. Wheels are 28x3-inch artillery, running on roller bearings. Engine is water cooled, horizontal, four cycle, single cylinder, 4½x6 inches, running from 150 to 1,400 revolutions. Planetary transmission, with two speeds, by hand side lever. Reverse is by foot pedal. Brakes on transmission and rear axle operate from the same foot pedal. Spark control at side of seat. Individual seats and wheel steering. In runabout type the price is $900; with tonneau, $1,000.

Friedman Automobile Co., of Chicago show four vehicles and an opposed motor in section, driven by power, on a stand. All frames are of wood, with angle iron reinforcement carried on platform springs. Artillery wheels, 30x3 inches. Three machines have horizontal, water cooled, opposed cylinders and drive of the friction wheel type. Motors are four cycle and 3¼x3, placed crosswise at the rear of the body. One controlling handle is used to shift the friction drive wheel to either side of the centre, and this lever is at the left hand side of the seat. Handle steering is used and a foot plunger for shifting the spark. The fourth vehicle has a single cylinder horizontal motor, 4-inch bore by 5 stroke, and drives through a planetary gear and chain, with speeds controlled by a hand lever at the left and foot lever off the reverse. The brake is on a drum separate from the differential and is operated by foot lever. Spark shifter is at the left side of the seat; steering is by handle. On all models water circulation is by rotary pump through cross tubes which make up the curved dash box front.

Columbus Motor Vehicle Co., of Columbus, Ohio, show a runabout with single cylinder and tonneau and chassis with opposed horizontal cylinders. The vehicles are named Santos-Dumont. The frame is of channel iron carried along the sides and back and carried at the rear on full elliptic springs and at front with ½-elliptic springs attached to shackles. Wheels are 30x3½, of the artillery type. The steering is by handle through a worm. The cylinders set off the centre of the crank case and are 4½x5, four-cycle, water jacketed and 12 horsepower. The motor is hung just back of the centre and to the left and drives through spur transmission gear with two speeds and reverse, by chain to differential, carried near the right rear axle bearing. Spark and throttle levers are carried on the wheel steering column. A novelty in the motor construction is that the air for the carburetter is taken through a long pipe into the crank chamber and from there passed through the carburetter under compression. Intake valves are automatic and sparking is of the wipe type. Water is carried by force pump through a coil placed between the forward springs. Combined gasolene and water tank is carried under French bonnet. The transmission works on the principle of the back gear of lathe and when the vehicle is standing still, with motor running, it becomes idle. An expanding clutch connects the transmission with the flywheel and the two speeds and reverse are all operated by single lever moving backward and sideways, operating on segments.

Flint Automobile Co., Flint, Mich., show a Flint Roadster with 2½-inch angle iron

Digitized by Google

frame forming a complete loop, supporting eht motor,carried on four ¾-elliptical springs. Artillery wheels, 28x3 inches. Motor is single cylinder, horizontal, water jacketed, 5¼ bore by 6 stroke, giving 8 horsepower at 750 revolutions; speed ranges from 150 to 1,100; automatic intake; planetary transmission, with two speeds and reverse. Forward speeds are controlled by hand lever forward of right side of seat, reverse is by foot lever. Throttle and spark levers at one side of seat. Brake on differential operated by foot lever. Gasolene tank holds nine gallons; water tank, seven gallons; radiation through coil under part hood, and by rotary pump; hood is used as a tool box. Jump spark ignition with dry battery. Steering is at the side and drive is direct by chain.

The Bartholomew Co., Peoria, Ill., show three Glide runabouts, selling at $750, with single seat, and $775 with dos-a-dos. The body is supported on ¾-elliptic springs at front and long-leaf drop springs at back. Wire wheels, 28x2½ inches are regular equipment, but wood wheels will be supplied at extra cost. Front wheels run on ball bearings and rear shaft in a tube on four roller bearings. The motor is carried on a U-shaped loop, the ends of which are in leaf spring form, resting in blocks on the rear axle, and the curve supported on a toggle hanging from a cross bar at about the centre of the frame. The motor is a four-cycle, single-cylinder, horizontal, placed centrally and of 6 horsepower, with mechanical intake. Planetary transmission, with two speeds and a reverse, through a ½x1½ inch chain. Side lever control for forward speeds, with one foot pedal operating both the reverse and differential brake. Emergency brake and throttle each have separate foot pedals. Jump spark is used, with control at side of seat, through dynamo and battery. Water circulation is through a coil placed under a short front hood, and by rotary pump. Steering is by lever acting through an eccentric at base of steering column. The transmission is on an extension of crank shaft and can be removed by taking off three nuts. The foot platform is attached direct to the running gear, the body coming off independently without disturbing various controlling levers.

Kammann Mfg. Co., Chicago, show an electric carryall with three seats, the second seat entering as a surrey and the third from the rear of the vehicle. The frame is made of channel iron with many cross under brackings and two diagonals in flat plates. It is mounted in ¼-elliptic springs, which run from the body diagonally to a point close to the hubs. The wheels have tubular spokes, with 30x2 inch solid tires, and run on ball bearing rings placed at the centre line of the hub. The rings in the forward wheels are pivoted at their centre line, thus bringing the wheel and hub well over the steering pivot. The body proper is made up of sheet aluminum with frosted effect. The jar of the road is taken off by using pneumatic seat, back and side cushions. The dash is a plain straigh dash and the mud guards run through from the extreme front to the extreme rear. The motor drive is on a long shaft running to brackets a short distance forward of the rear hubs, and the drive from here back is taken by a short chain ⅜x1¼. Side steering is used and the three speeds and reverse are controlled by a handle outside the left end of the front seat. Near this handle is the switch for forward and back running, which automatically throws in when the control lever is thrown for reverse. The vehicle is an oddity in its design and finish.

The Woods Motor Vehicle Co., Chicago, was one of the earliest and most pretentious of the Western makers of electric vehicles. A recent organization placed the concern on a sound footing, and enabled it to adopt a thoroughly progressive policy. A complete line of Woods vehicles was shown, covering practically all the types known to the high class carriage builder. Of these the closed vehicles—coupes, broughams, victorias, etc. —were especially noteworthy. Exide, Porter or Helios-Upton batteries are supplied, and a radius of fifty miles on one charge is given.

Wagner Cycle Co., St. Paul, Minn., show a motor bicycle and a motor tandem with a rear drop frame. The former sells at $200 and the latter is placed at a price of $225, being a moderate advance for the additional facility.

Standard Motor Vehicle Co., Chicago, show an angle iron running gear, 32 by 4 wheels, side chain drive. Their motors and vehicles have not yet turned up.

Porter Battery Co., Chicago, show a car claimed to have been run 187 miles one charge of their 12-cell battery.

Northwestern Battery Co., Chicago, show vehicle which, it is asserted, covered 96½ miles with one charge of their 12-cell battery.

Buffalo Electric Carriage Co. show two Stanhopes and one golf brake.

Waterloo Gasolene Engine Co., Waterloo, Iowa, show the Duryea gasolene cars.

ACCESSORIES

Brecht Automobile Co., St. Louis, show a running gear without engine or transmission. The frame, made of angle iron forming a complete loop of the four sides, is suspended on half elliptic springs hung from shackles; artillery wheels, 3x30 inches; roller bearings and brake bands on rear hubs; steering wheel with worm and gear. The forward ends of the rear springs carry in their shackles the distance rods. A body shows individual seats, removable rear lid and brass French type front bonnet.

Alfred Vischer & Co., New York, show the Eisemann igniter, which consists of a light but powerful magneto and induction coil. Attached to the magneto and forming a part of it, the entire apparatus minus the coil is self contained, is the commutator device for sparking any number of cylinders automatically. This commutating device runs synchronously with the magneto armature. The armature is wound so as to be highly self-inductive, thus performing the office of a spark coil in addition to generating the current. A hot spark is obtained at slowest speeds. Uniform high speed is not required. Magneto is geared direct or run by any form of transmission. Ignition may be advanced or retarded to any part of the stroke.

Cushman Motor Co., Lincoln, Neb., show a line of two cycle water jacketed motors. A description of the 3 horsepower motor will serve to illustrate all Cushman motors of whatever size, all being built on the same general lines. This motor is 20 inches over all and weighs 100 pounds. The rating is at 1,000 revolutions. 4 b. horsepower, all claimed at 1,300 revolutions, and 5 horsepower, at 2,000. Using the crank chamber for the compression to force the mixture to the cylinder a ring device is used to prevent leaking at the boxes. Jump spark ignition is used with a mica plug. A shifting spark controller is attached to the crank shaft to prevent kicking in starting. Speed of the engine is controlled through a throttle.

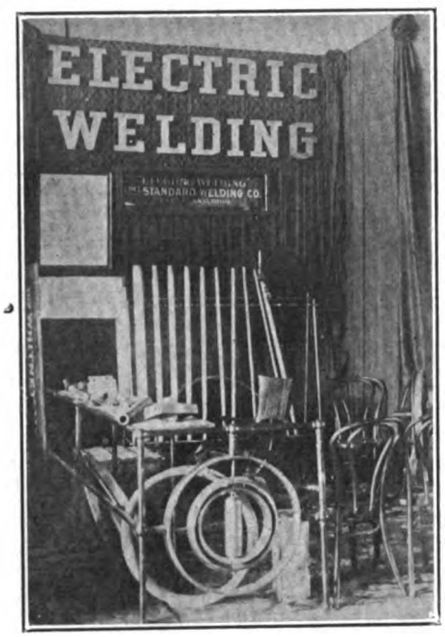
Hine-Watt Mfg. Co., Chicago, show their automatic acetylene gas lamps for both front, side and rear uses. In these lamps a gas valve regulates the size of the flame by means of a gas cock. The carbide cock is a reloadable cartridge. The water is carried through a winged distributor. The burner is removable and is non-carbonizing. A splash diaphragm in the water can prevents waste of water when lamp is used on rough roads. Gas is generated at low pressure and this, with the separable burner, gives a clean burning lamp requiring but little attention, and this is of the "quick working" kind.

Brandenburg Bros. & Alliger, New York and Chicago, are showing the Thor motor bicycle parts and Trebert gasolene motors. The latter are of four cycle upright type in two or four cylinders, with large inlet and exhaust valves, both mechanically operated. Inlet valves are on the right side of the cylinder and exhaust valves on the left, with a sparking plug placed above the inlet. The cylinders are 4⅛x5 stroke. The valves and plug can be removed by removing a yoke nut and lifting the chamber head. This makes it possible to inspect the spark plugs without disturbing the wire connections. cam shafts are directly under the valve stems, with a large roller fitted in the lifter. Crank shaft has journals between each crank. The flywheel is bolted on crank shaft disk. The cylinders are bolted to the base. Engine frames have four extending arms for attaching to frame of running gear.

Hoffman Motor Co., of Chicago, show a two-cylinder upright engine with automatic intakes, cylinders 4x5, water jacketed, giving 8 horsepower at 800 revolutions. The secondary shaft extends along the front of

Digitized by Google

the base and outside, working the exhaust valves and the shifting spark cam. Also a water jacketed horizontal motor with 4¾x6 single cylinder, giving 7 horsepower at 500 revolutions. A 16 horsepower 4-cylinder motor is also exhibited, having the same constructive features as the two-cylinder engine.



P. J. Dasey Co., Chicago, shows Ruteuber upright water jacketed motors in two and four cylinders of 4, 6, 8 and 10 horsepower. These have outside flywheels, automatic intake valves, jump spark ignition. Sizes of cylinders for 6 and 10 horsepower are 3¾x4 and 3½x4 respectively. In horizontal water jacketed motors, two types are shown; one with transmission gear attached. Cylinder size, 4½x6, giving 5 horsepower at 1,400 revolutions. Automatic intakes; transmission of sun and planet type. Full line of parts, materials and equipments. A vehicle is also shown named the Monarch, made up with horizontal motor of the type having transmission attached. The frame is of angle iron resting on full epiliptical springs at the back and ¾ eliptic in front. Two speeds forward, controlled by side lever and a reverse by foot pedal on differential that also brakes on the transmission. The spark shifter and throttle are combined in lever at side of seat. Handle steering. In starting this motor there is no compression to crank against. The intake valve butts at its top against a rubber buffer, which holds it slightly open as motor is started. The effect of the first explosion and subsequent charges is to force this valve against the buffer, which permits the poppet to come to a full seat.

Imperial Wheel Co., Flint, Mich., show artillery wheels with wood hub confined within metal flanges. The entire wheel is made before assembling the flanges. The front and rear flanges have reinforcements in which a key seat is made to fit the axle desired, thus bringing the drive of the machine on the flange at the centre of wheel. This construction leaves the axle at full size.

John F. McCanna Co., Chicago, show a line of oilers of the force speed system. These are made with any number of outlets. Sight feeders are placed on the front of a box-like metallic container, in the centre of which turns a gear wheel driven by a worm, the shaft of which carries a pulley run from the engine by belt or other means. The central gear drives as many plunger pumps as there are sight feeders, there being one pump for each outlet. Any pump in the system can be cut out of feed and all feeds are adjustable for any amount. An attached pressure gauge shows force against which pumps are working.

The Miller-Knoblock Electric Mfg. Co. South Bend, Ind., show an ignition dynamo having a magnetic generator carrying with it a set of field coils which surround the permanent magnets. The object of this is to do away with the use of spark coil, the field coils performing this duty. By passing the current through the field coils around the magnets the latter are charged with magnetism to their full capacity to give the machine at all times high efficiency. By the use of both field coils and permanent magnets it is claimed that the advantages are obtained of the dynamo and magneto combined, with the addition of eliminating the coil. The speed can vary from a few hundred to five thousand revolutions.

Chicago Storage Battery Co., of Chicago, is showing a new system of storage battery that is alkaline and trimetallic. It is charged at any rate that the cell terminals will carry. They weigh 5½ pounds per cell, with a hundred amperes per cell, and an electro-motive force of 1.4. They are made without lead grids or plates, and can be

STANDARD WELDING CO.'S EXHIBIT.

charged in one hour. At this exhibit is shown a novelty in testing by mounting a vehicle on rollers. The vehicle is run to show the speed with different numbers of cells and the distance is indicated on the large dial.

The Turner Brass Works, Chicago, show their well known line of torches and samples of aluminum castings. Their particularly interesting exhibit is the Turner carburretter. It is positive feed in that unless purposely throttled it feeds the same amount of gasolene at every suction stroke, regardless of the motor speed. The regulation is by the means of a ratchet and half gear that work together to control the proportioning of gasolene passing by the needle and the air through the mixer.

The Barton Boiler Co., of Chicago, show a flash boiler of interchangeable construction throughout. It is made up of fourteen or more units of coils. These coils are spiral in curvature and the piping is then carried twice across in a double loop, reaching to the outside of the coil, where it is connected to the next unit. It is claimed for this construction that it particularly facilitates repairs or other necessary getting at the tubes, as by loosening any two couplings all the coils above can be thrown back in order to get at the coil needing attention.

Northwestern Storage Battery Co., Chicago, show a pasted plate battery giving about six amperes per pound. The sizes ar shown for automobiles, one at 15 pounds per cell, 90 amperes, and 4½ hours, and the other at 19 pounds, 120 amperes, 6 hours.

American Gasolene Motor Co., Chicago, show a planetary transmission gear with two speeds and reverse or one speed and reverse, in three sizes, taking in from three to twenty horsepower. One brake band is used for slow speed forward and reverse. Slow speed forward is obtained by tightening brake band to secure any speed up to six miles an hour. Fast speed forward is by releasing brake band and engaging friction clutch direct. Slow speed reverse by shifting collar next to sprocket and tightening outside brake band. The features for this gear is that it has an emergency brake band without using the foot brake, giving two brakes without extra attachments. All speeds, including emergency brakes, can be attached to one lever or any other device used.

Anti-Friction Equipment Co., New York, show the Beasley tires, constructed on the principle of a truss bridge. The tire is practically made up of two parts, an outer casing with thick wall, and an inner tubular section having webs running in a zigzag fashion throughout the entire length. The tire is made in 2½ to 3 inches in cross section and 28 and 30 in diameter, with 5 and 8 lugs, of standard spacing.

National Engine Co., Rockford, Ill., show a stationary upright engine attached to a dynamo for electric vehicle charging purposes. The fuel is fed positively by a pump into the air pipe at every working cycle, and always with the same quantity, thus giving the same pressure on the piston. The engine is equipped with both a make and break electric ignition and incandescent tube.

The Standard Carriage Lamp Co., Chicago, show a complete line of acetylene lamps of all types, sizes and weights, for both front, side and rear siggnal uses, also electric lights of the same description. Generators are made that can be placed inside the vehicle, the gas being conducted through a tube. Carbide and water system is self controlling. Lamps are furnished in either nickel or brass, or combined with Japan finish.

Porter Battery Co., Chicago, show in addition to their well known type A batteries for electric vehicle use, a special battery for sparking gasolene motors, put up in dry form, that can be charged from any 110-volt, direct current lamp. The capacity is six volts, 35 to 40 ampere hours and the weight 16 pounds. It is claimed that with a 1-5

Digitized by Google

ampere coil this cell is good for 200 hours' continuous running without charging.

LONDON SHOW WAS BARREN.

In every respect save that of magnitude the British show at the Crystal Palace, London, was a poor second to the Paris function of last year. There was nothing approaching the sensational about it.

If there was little to enthuse over, however, it was apparent that British designers are not yet ready to follow the example of their Gallic rivals and assume the role of copyists. There was much to suggest the best French and German practice; but with it all there was a distinct note of individuality. A very considerable number of makers adhered to their own designs.

British makers, too, are in the majority. Slightly more than sixty makes of British cars were shown, to about twenty French, eleven American and three Germen.

Of the three German features that carried the Paris show by storm—the honeycomb radiator, the mechanical intake valve and the U shape pressed steel frame—only the first named was specially prominent at the Palace show. The others were seen on a number of stands, but were very far from being general. In fact, in the matter of frames the tubular type shows a distinct gain, although no one seems able to explain why.

As in this country, the gasolene car has a long lead. It formed the great bulk of the exhibits, comprising quite three-quarters of the whole.

But steam is far from being neglected. The traditional British fondness for this form of power is well known, and a very good showing was made. American influence was, as always, strong. The well known runabout type had a good lead, but, as at the Madison Square Garden show, the familiar gasolene form made its appearance on British as well as American cars. Of the flash and semi-flash systems of steam generation examples were shown from England, France and America, viz., the Albany, the Serpollet and the White. In addition to the latter, the Toledo, Locomobile and Weston (Grout) were shown.

In the gasolene and electric sections the Oldsmobile, Winton, Northern, Rambler and Baker were staged, most of them by their British representatives.

Scarcely a French or German car of prominence was missing.

VEEDER'S SPEED INDICATOR

Details and Operation of the Ingenious Instrument Finally Disclosed.

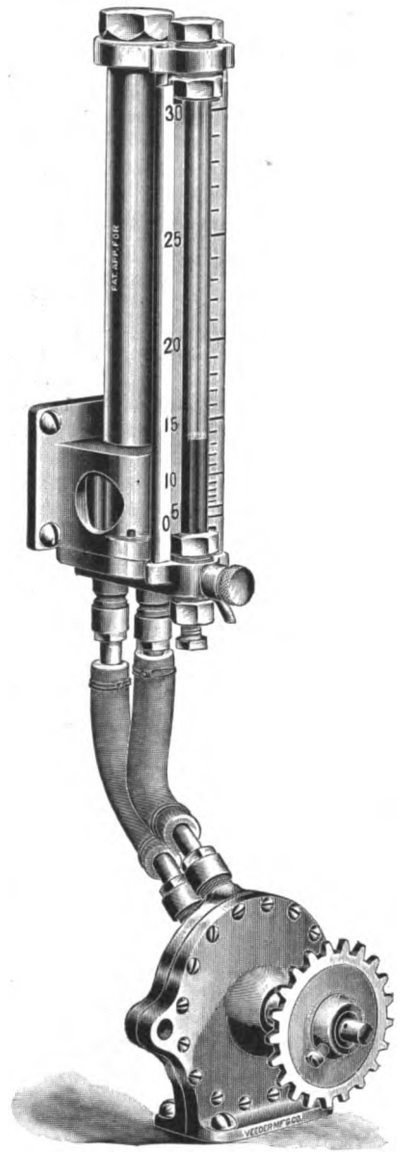
At the recent show the Veeder Tachometer attracted wide atention. It was recognized as an ingenious and eminently practicable article, and one that would tell the story of car speeds so clearly as to render mistakes impossible. The name of Veeder stamped it as sound mechanically, while even a superficial examination made it plain that the details had been carried out in a manner quite beyond criticism.

The device is compact, handsome, and so disposed as to be in the way as little as possible. It is made in two styles, Form A, for automobiles, and Form C, a portable instrument for registering the revolutions of shafting, motors, etc.

There are two principal parts: The pump, consisting of a casing inclosing a paddle wheel mounted on a shaft, and the indicator, embracing a glass indicator tube, a scale and a reservoir. These parts are connected by two rubber or copper tubes.

The periphery of the pump is connected with the bottom of the glass indicator tube by suitable passages or tubing and the bottom of the reservior communicates with the centre of the pump.

The Tachometer is filled with a suitable liquid, generally colored alcohol, so that when at rest it stands on a level with the zero mark on the scale beside the indicator tube. The surface of the liquid in the reservoir will be slightly lower than in the tube on account of the capillary attraction of the latter.



When the paddle wheel in the pump is revolved, the centrifugal force draws down the liquid in the reservoir and forces it up in the indicator tube. The vertical height between the two surfaces will be approximately proportional to the square of the speed of revolution.

The connecting tubes or piping may be of any desired length, provided there is at all points an upward inclination from the pump to the indicator.

For convenience the reservoir is placed close to the indicator tube and communicates with the top of the latter, so that the instrument may be sealed to prevent evaporation, and if the liquid should be forced by excessive speed to overflow the top of the tube it will flow back into the reservoir. If the reservoir is placed in front or behind the indicator tube on a moving vehicle, then, when the speed of the latter changes, a change in level between the two surfaces of the liquid will take place on account of the inertia of the liquid and independently of the change due to the pump. A similar change will take place when the indicator is tipped to one side or inclined when the vehicle is going up or down a hill. These changes are, however, very slight, and in ordinary practice are negligible. They may be entirely overcome by making the axis of the reservoir concentric with the axis of the indicator tube.

It will be seen that the instrument is extremely simple in construction, and can be made very durable, since the only wearing parts are the shaft and its bearings. There are no small pivots or wheels to wear out nor springs to break and the calibration is constant.

To adjust the level of the liquid to the zero mark on the scale the cap should be removed on top of reservoir tube and the liquid poured in, or the liquid should be drawn off at the bottom by a suitable cock placed there for that purpose, as the case may require.

ONE-HALF ACTUAL SIZE.

For automobiles, the scales are graduated to show miles per hour and are of two lengths, 6 in. and 12 in. The shorter scales are used for maximum speeds of either 20, 30 or 40 miles per hour, and the longer scales of 40, 50, 60, or even higher speeds if desired. The scale shown in cut is a 6 in., and will indicate a maximum speed of 30 miles per hour. The pump is driven by suitable gearing either direct from the automobile wheel or from some shaft positively geared on the wheels. The ratio of the gears used depends on the size of the automobile wheel and the scale desired. The indicator is placed in plain sight on the dashboard.

In ordering it is necessary to give make and model car, with diameter or circumference of wheel, including tire; and it is well to send also a sketch of dashboard and a dimension drawing of the axle or knuckle joint, and of the wheel.

The Diesel That Didn't.

Although widely heralded a year or two ago as the successor of the present type of gasolene motor, the Diesel engine has been but little heard of as applied to automobiles.

The Diesel engine works on a most ingenious system, and gives perfect combustion of heavy oils. Instead of consuming oil by mixing with air and then firing it, the Diesel plan is to compress air at great pressure and thus reduce its volume and increase its temperature considerably. A stream of what may be called red hot air is then allowed to pass from the compression apparatus into the combustion chamber, and oil is allowed to spray on this stream. There being a great excess of air, as compared to oil, and the temperature of the air being very high, it follows that every drop of oil is perfectly consumed and gives out its full heat value. The expansive quality of the products of the oil is used to drive the engine and also to work the apparatus for compressing the air. This compressing arrangement would be one of the drawbacks of such a system on a motor car.

To Run Motor Busses in Ohio.

With $25,000 capital, the People's Auto Transit Co. has been incorporated, to run lines of automobile 'buses in Ohio. The corporators are residents of Lorain, Huron and Erie counties, and the purpose of the company is to establish auto car routes through the thickly settled sections not covered by the electric railways. Vermilion will be the main objective point. The cars will somewhat resemble the electric cars, and will in a measure take their place. The routes as laid out extend from Oberlin and other points north to the lake. The company will begin operations this spring.

Pneumatic-Tired Steering Wheels Next?

At the Crystal Palace show, which closed last week, a British concern showed a pneumatic steering wheel. Its periphery is formed of a single-tube pneumatic tire, which can be inflated in the ordinary manner. There can be no doubt that this device will considerably reduce the vibration sometimes felt with many of the rigid wheels usually employed.

To remove tarnish from brass when it will not give way to an ordinary polish take a strong oxalic acid and rub on freely; let it stand for one minute and wash off with water.

IMPORTANCE OF OILING

"No car Lacking Facilities for Lubrication can be Called Well-Made," Says this Lecturer.

"Lubrication may be described as the art of making things work smoothly. It is a wide term, covering human as well as mechanical relationships, between which there is a close analogy," said Thomas Clarkson in an address delivered before the Automobile Club of Great Britain.

"The necessity of making things work smoothly is apparent to all, and nowhere does this apply with greater force than in the vitals of an automobile, where unsmoothness of working is a sure cause of trouble and expense. The necessity is so vitally important as affecting the life of a motor and its general fitness that no apology is necessary for introducing this subject, which will amply reward careful investigation.

"It is a fair question to ask, Why will not things work smoothly without lubrication? The answer is found in that natural resistance to motion which is commonly called 'friction,' and which it is the object of lubrication to eliminate as far as possible. Friction can never be entirely vanquished; if it could, then perpetual motion would result as a natural consequence, and once the starting inertia of a body has been overcome it would continue to move indefinitely.

"To appreciate lubrication we may with advantage first study the enemy—'friction.' Its laws are few and simple, and may be divided into two classes—static and dynamic. The first deals with the friction of rest, and is given by some the not inappropriate name of 'stiction' (belts and friction clutches come under this heading). The second deals with the friction of motion. It is with this class that we are more particularly concerned.

"The friction of motion may be so subdivided into rolling and sliding friction. The former relates to ball and roller bearings, the latter to plain bearings. In rolling friction the balls or rollers act in a manner closely analogous to the lubricating medium of a plain bearing by keeping the working surfaces apart. If it were possible to make a ball or roller bearing with absolutely no sliding friction the use of a fluid lubricant might be safely dispensed with; but there is sliding between the balls or rollers themselves, or between them and the cage employed to keep them in position. The amount of sliding friction is lessened when intermediate balls or rollers are used; but it is not entirely eliminated. The extra complication and cost of these bearings qualify their other advantages, and the friction of a well designed plain bearing, properly lubricated and protected, is very much smaller than many people imagine.

"The amount of friction between two surfaces sliding together depends upon several things: (1) The pressure applied to them; (2) the material of the surfaces; (3) their smoothness and hardness; (4) their wetness and dryness; (5) their temperature, and (6) the viscosity of the lubricating medium.

"The cause of friction and the reason why two bodies touching each other offer resistance to relative motion appears to be that the touching surfaces interpenetrate and interlock. The extent depends upon the degree of roughness or polish, and upon the facility possessed by one of the substances to mould and adapt its surface to correspond closely to the microscopic configuration of the other. I refer to substances possessing plastic properties, such as leather fibre, rubber and the like. To reduce friction to its lowest degree it is clear that surfaces must be as smooth as possible, and that at least one of them should be capable of the highest polish. The degree of polish depends largely upon the hardness of the substance—hence the suitability of case hardened steel for motion pins and valve mechanism. The surface burnishes like a mirror and gives its mate no chance of becoming too intimate.

"Although the amount of friction is generally stated to be independent of the extent of surface in contact, for practical reasons this old law needs qualification.

"If the surface is large the pressure per unit area is correspondingly small, and may be quite insufficient to squeeze out the film of lubricant—hence the active surfaces are kept at a respectful distance. But with relatively small wearing surfaces, the pressure on the lubricant is proportionately greater. The surfaces possess a more penetrative power, which—if it cannot be checked—will squeeze out the lubricant and permit physical contact. This may become so intimate as to start the force of cohesion, with 'scoring,' or tearing of the surfaces, as an immediate result.

"The principal object of lubrication is to prevent such a result. It must not be expected that lubrication alone, however perfect, will make up for errors of design in making the surfaces too small for the work they have to do; but it is possible for a well lubricated machine of inferior design to do more useful work than an otherwise more perfectly designed machine in which lubrication is defective.

"Indeed, lubrication is of such primary importance that a machine with defective lubrication, however perfect otherwise, cannot be described as well made. This applies with special force to an automobile, and investigation of this point will well repay an intending buyer. So much pleasure is lost, and the depreciation in value of a car is so rapid by imperfect lubrication that the importance of good lubrication cannot be easily overestimated. Another important condition to smoothness of working is to keep out intruders. The lubricant should be clean and free from solid substances. This medium is the only thing that should be permitted to come between the working surfaces. If particles of dust or grit are permitted their smallness of area and consequent penetration enable them to cut through the film of lubricant, to the detriment of the working surfaces; therefore intruders must be kept out.

"Next, as to the means of securing the most reliable lubrication with the smallest attention on the part of the driver. Forms of lubricators (or devices for feeding the lubricant to the working surfaces) are simply innumerable. Much ingenuity has been displayed in their construction, with the object of securing a regular feed and avoiding stoppages, which would speedily have disastrous consequences.

"A lubricator consists of a reservoir and one or more feeders. It may be portable, as in the old fashioned oil can, which is perhaps the most elementary form of lubricator. Usually the lubricator is fixed close to the bearing it is to serve, or, should this be inaccessible, it may be fixed at a distance and a connecting pipe used. The use of an oil can is extremely wasteful in lubricant, and should the interval between successive feedings be too long, permanent injury to the bearing is likely to result.

"The same general conclusion applies to all devices which depend for their action upon human adjustment and attention; and I have no hesitation in affirming that, to expect a driver to regularly fill and periodically inspect and adjust a lot of lubricators in a car is highly unreasonable and foolish. Even with a careful driver some may be overlooked—or in the act of filling foreign substances may get in—besides, the filling operation is messy and disagreeable, and, therefore, likely to be postponed unduly. In preparing a car for service attention to lubricators forms no small part; and could this be entirely done away with the time would be shortened and the pleasure of automobiling greatly enhanced."

Paris Ragpickers Protest.

Parisian ragpickers and scavengers are up in arms at the proposal to introduce automobile garbage wagogne. The Paris Municipal Council has formed a committee which is to study the project of introducing the automobile principle in the street cleaning and scavenger service.

M. Paulmier the doyen of the ragpickers, in an interview, spoke as follows on the alleged insalubrity of the business and of the proposed reforms, which, to his way of thinking, can only be intrusions: "It is asserted that our business is unhealthy. They talk of microbes, but the microbe does not exist in our field of labor. For us the greatest malady, that which may cause our death, 'c'est les riches,' who are talking of marvellous machines, all these monopolists who want to take our bread from us."

Moses Fifield has been elected assistant secretary of the Rhode Island Automobile Club. He succeeds B. S. Clark, who resigned.

WHAT ARE "MODERATE MEANS?"

Matter of Motor Costs Calls up the Question—Figures That Proved Misleading.

What is a "man of moderate means"? That question is exciting lively discussion in England, and all because an autoist recently read a paper on the above subject before the Automobile Club of Great Britain. By inference he designated himself as a man of moderate means. When he presented a detailed statement showing that his car, with accessories, cost nearly $3,000, and that he had spent nearly $1,500 additional to keep it in commission, it will be seen why there should be such a how-de-do about it.

The car was a 10 horsepower gasolene touring car, and was used pretty constantly. In nine months it covered 6,600 miles, this distance being made up of long and short journeys in town and country over every description of road to be met with in Great Britain, its owner, Captain Kennett Campbell, using it for all purposes.

The various items that go to make up the totals are interesting at least. The car and extras, for example, come out as follows:

	£	s.	d.
Price of car	525	0	0
Extras, carriage rugs, etc.	26	15	2
Tips, etc., and learning to drive	3	17	5
Delivery of car from makers	3	18	10
Total	£559	11	5

The "running expenses" are figured as follows:

	£	s.	d.
Gasolene. This works out at about ¾d. a mile, but it should not be forgotten that there is a considerable amount of waste in gasolene in using the car for town work.	21	15	8
Lubricants	6	16	7
Maps	0	5	0
Sundries	9	17	2
Repairs to car body, frame and engine. (This works out at about 2½d. a mile, and includes accidents, which resulted in two bent axles—one due to a sideslip and the other to running into a ditch to avoid a collision. The side of the car was also kicked through by a horse, the owner of which compromised by paying half the damage done.)	67	0	5
Tires, including four new tire covers, one new inner tube and two old tires with "treads"; or 1¾d. a mile	48	6	0
Making a total of (for running expenses of all kinds for nine months, or, at the same rate, £205 7c. 8d. per annuam; for the 6,600 miles' run it comes to 5½d. per mile	£154	0	10

The cost of motor, groom and coachhouse per annum is as follows:

	£	s.	d.
Wages of motor groom at 25s. a week	65	0	0
Livery, clothes and boots	20	7	3
License for groom	0	15	0
License for motor car	2	2	0
Rent of stables	30	0	0
Taxes on stables	8	17	4
Light, say	1	0	0
Water	1	12	4
Christmas present	0	10	0
Total	£130	3	11

The grand total, therefore, is £483 15s, 2d., or $4,219.

It is small wonder that other men of "moderate means" take up the cudgels in behalf of the car and contend that Captain Campbell is not one of them. An autoist, they contend, may spend a great deal more money than this on a car in a year or he may spend very much less. Summing up the matter, the Autocar says:

"At the present moment it is most difficult, of course, to arrive at the actual cost of automobilism per mile, when depreciation is taken into consideration. But if the man of moderate means is content to buy a comparatively reasonably priced car and to go about all other matters of expense in a manner which characterize him, we are inclined to the opinion that within a margin of, say, from 4,000 to 5,000 miles per annum—which, assuming the man of moderate means to be engaged in business day by day, is about all he will find time to cover—his running expenses, including insurance, should not cost him at the outside more than from 1¼d. to 1½d. per mile. As Captain Kenneth Campbell's paper was given under what he himself suggested was a misleading title, we would welcome correspondence upon the alleged subject of his discourse, viz., 'Autocars for Men of Really Moderate Means.' A man who, altogether outside cost and loss on his car can afford to pay £284 4c 9d. for his annual automobilism, does not appeal to many people as "a man of really moderate means."

That Road Across the Meadows.

That much talked of project, an automobile road across the meadows between Jersey City and Newark, N. J., is up again. It is planned to purchase of the Belleville turnpike, between Jersey City and Kearny, for an automobile driveway. Hudson County owns the turnpike, and the automobilists will first endeavor to secure it as private property. Failing in this, they will open negotiations with the Freeholders and the New Jersey State Road Commissioner.

The promoters of the scheme are mainly residents of Newark, Montclair, Bloomfield and adjoining towns, who have business interests in Manhattan. As a highway to New York the Belleville turnpike is over two miles shorter for residents of Newark, Montclair and Bloomfield than the Newark turnpike.

The Belleville turnpike is four miles in length and is used almost entirely by funeral processions from Jersey City to Arlington Cemetery. It is understood a definite proposition will be submitted to the Hudson County Freeholders at their meeting on Thursday, March 5.

THEY ROPE THE TIRES

How the New York Motor Cab Drivers Get About When Horses Slip and Slide.

"It does not take long for the average cabby to learn how to cope with a sudden emergency," remarked an observant autoist to the Motor World man on Tuesday. "On such a day as this, with a heavy fall of snow on a foundation of ice and sleet, the cabby is likely to have an interesting time of it, and that whether he drives a horse cab or a motor driven one. The horses were quite helpless. At noon on lower Broadway there was a mass of trolley cars, horse vehicles of all kinds and a few motor vehicles, so hopelessly mixed up that the stalwart policemen were at their wits end to disentangle it and keep things moving in some sort of fashion.

"Naturally the motor vehicle would have suffered, too, for when the power was applied to the rear wheels the latter would revolve without gripping the ice and snow covered surface. But the first cab I saw was gliding along as smoothly as you please and as rapidly as the traffic would permit.

Getting close to it, I discovered the reason. On each rear wheel was a coil of rope about three-quarters of an inch in diameter wrapped around the tire and rim twice and then knotted loosely. Its movement was checked by the spokes, between which it was fastened, but it was purposely left loose, so that it could move.

"Apparently that was what made the vehicle grip, and each cabby seemed to be in the secret, for each cab I saw—and I began to notice them—had the same arrangement.

"Seemingly, too, the fitting of these 'non-slippers' was done by the cabby, for all kinds and sizes of rope were used. Sometimes it was new, at others old and ragged. Evidently it had been procured haphazardly, the cabbies borrowing or buying it, as necessity compelled.

"The thing did not improve the looks of the vehicle, but it did the business, and that was what was wanted. No, there is nothing new about it, but the practical unanimity of its adoption caught my fancy."

Eschew Rubber Tubing.

Never use rubber tubing for gasolene connections, because (1) gasolene is a solvent of rubber, consequently it will become contaminated by the dissolved material; (2) gasolene will percolate through the rubber, causing much waste and a possible danger from fire; (3) small particles of rubber may become detached from the tube and be swept into the carburetter, where, sooner or later, the symptoms of a choked spray will develop.

A periodical inspection of the bolts securing the tire to the rim must be made if serious trouble is to be avoided. Creeping will inevitably set in if these bolts are not kept tight, and the first indication of it will be a valve stem sheered off.

SUPERSEDES LOCOMOTIVES

"Autonobiles" for French Railways—Saves 110 Tons Weight and Avoids Smoke, Noise, etc.

June next is the time set for the inauguration of the new "autonomobile" service on French railways. On the 18th of that month there will start from the Lyons station, in Paris, a train composed of three "autonomobile" carriages—that is to say, carriages that are both autonomous and motor cars—which will enter the Dijon station at noon. The 315 kilometres (195 miles) between Paris and Dijon will thus have been covered in three hours and ten minutes, or at a normal speed of 100 kilometres (62 miles) an hour; and the same speed may be maintained between Dijon and Lyons, Lyons and Marseilles, Marseilles and Nice, and Calais and Paris uninterruptedly, so that the distance between Calais and Nice can be covered in fourteen hours.

This invention is now neither a project nor an experiment, but exists and works, and its application is merely postponed for some months for the construction of the actual rolling stock.

As its name indicates, the autonomobile supersedes the locomotive—that is, it dispenses in every train, short or long, slow or fast, with a weight of 110 tons. It saves the considerable cost of locomotives. It abolishes smoke, steam, noise, vibration, the jolt incidental to stopping and starting, and the necessity of stopping to take up water. It also abolishes all the men in charge of a locomotive except the engine driver. The new carriage is 17 metres (56 feet) long—that is to say, the length of the present French corridor carriage. Of these 17 metres a space of 2.6 metres (8.5 feet) in front is occupied by the traction apparatus, while the remaining 14.4 metres (47.5 feet) will comfortably accommodate forty passengers and the 1,200 kilogrammes (2,645 pounds) of luggage allowed them. The cost of the autonomobile is the same as that of the first class corridor carriage, while the weight, including the traction apparatus, is also the same. Thus the abolition of the locomotive is an accomplished fact, and the rails which now have to bear the weight of the locomotive and tender, as well as of the carriages, are relieved therefrom, is the conclusion of the London Times, from which this description is summarized.

The system is one which, in an embryo form and dating back several years, has been applied to short and fast tramway lines, but never to practically unlimited distances.

Briefly, in front of every autonomobile is an apparatus producing with a liter of petroleum per kilometre (1.05 quarts per 0.62 mile) the steam power requisite for propelling the carriage with its forty passengers and 1,200 kilogrammes of luggage at a normal and almost minimum speed of 100 kilometres (62 miles) an hour, and that, too, without interruption, noise or jerk. In order to overcome the air resistance which such a speed entails the autonomobile in front and behind is so shaped as to cut the air, which thus becomes an auxiliary rather than an obstacle. As each autonomobile has its own apparatus, the carriages, of course, might go singly as easily as when coupled together. It is said that the weight of the apparatus, apart from the petroleum and water carried, is trivial. As to the latter, to go from Paris to Nice 1,100 or 1,200 kilogrammes (290.5 or 317 gallons) of petroleum and 4,000 or 5,000 kilogrammes (1,056 or 1,321 gallons) of water will be required. This will allow of the whole journey being made without a stop; only care must be taken to guard against overheating.

Sound Sense From Connecticut.

"The automobile drivers are now running up against the same kind of legislation as was met by bicycle riders when that vehicle was first introduced. There are many conservative people who would always see things done in the same old way and who, when anything new is introduced, resent the intrusion and fly to the legislature for all sorts of restrictions to protect themselves," says the Manchester (Conn.) Herald.

"The fact is the progressive men who rode bicycles when they first came out, and who are riding in automobiles to-day, are just as good citizens as their fathers who rode inrockaway carriages. They have no more desire to cause injury to life and property than their critics. The number of bicycles used now far exceeds the number of all other kinds of vehicles put together, yet bicycle accidents are comparatively rare. This immunity from accident is not caused by laws regulating the speed of bicycles or requiring the use of bells and lanterns; but it is due to the fact that all concerned have become accustomed to the new vehicle and have adjusted themselves to the conditions of its use.

"The automobile, like the bicycle, is bound to become a popular vehicle, and no laws which may be passed now will prevent the public from availing itself of the economy and speed as well as other advantages possessed by the automobile. In due time the automobile as well as the bicycle will find its place and will be accepted as a matter of course."

One Look Sufficient!

"Automobiling this year will be very popular. For instance, one look at the machinery will give any one an idea how the machine works, and it will take scarcely any time to master the works," sapiently remarks the Buffalo News.

"Things have been reduced to their simplest form, and any one who has his nerve with him can become an expert chauffeur. All one wants is confidence in his own ability to control the machine. The great mistake many people make is that they change their minds too often."

PREVENTS TIRE NIPPING

Device Employed by an Automobilist to Overcome the Evil and how it Works.

From the time the first pneumatic tire came out of Ireland there has been more or less trouble with "nipping" or pinching the air tube between the road and the wheel rim. At one time cyclists used to cover their rims with felt strips in the endeavor to prevent "nipping." An English autoist has had recourse to a somewhat similar method, and with complete success.

"The plan works most admirably, and after various experiments I can give the most satisfactory width of felt for 80 millimetre tires," he says. "The felt for this size should be just two inches wide, and long enough to encircle the rim of the wheel and lap over for two inches. This felt must be at least a quarter of an inch in thickness, and must be very close and stiff. It should be treated with three heavy coats of solution on one side and a two inch strip of canvas put on this. When dry this canvas must be solutioned with three or four coats for about three-quarters of an inch on the reverse side, and the fixed edge of the cover similarly treated. The canvas must then be pressed into position all round this and allowed to dry thoroughly. When this has been done, the ends of the felt strip can be sewn together so that it forms an endless band. When the cover is in place, and one side only detached, the felt flap will stretch across the felloe and rest over the edge of the latter. The air tube is then put into place, a hole having been cut in the felt to permit the valve to pass through, and the loose edge of the cover slipped under the felt and canvas, which will thus raise the tube into position and form a bridge across the bottom of the cover on which the tube can rest. The wing nuts and bolts which prevent the cover creeping are, of course, under the felt.

"The result is that the tire can be put on in half the time, and the air tube cannot be nipped either then or by the action of the movement of the cover. Furthermore, in the event of a puncture the canvas and felt will protect the air tube for a few yards while the car is stopped, and it must be remembered that a short distance with an unprotected tube may mean a great deal of damage."

Increasing In Knoxville.

One year ago there were but four automobiles in Knoxville, Tenn., to-day there are ten, and it is estimated that before the end of the present year there will be between twenty-five and fifty in use. So keen is the interest displayed that an automobile club is talked of, and will probably be organized within a few weeks. Cowan Rodgers is the moving spirit in the project.

AT SIXTY PER HOUR

Sensations of one who was Given an Unexpected "Treat" and why he did not Enjoy it.

Did you ever experience the sensation of travelling in an automobile at a mile a minute gait?

Did you ever after a Welsh rarebit or something equally indigestible experience the sensation of falling into space with the accompanying dread of the shock of landing?

The two are somewhat akin, as a couple of Motor World men can testify. Not that they sought the experience. Quite the contrary. Like the adage regarding greatness, it was thrust upon them.

It all happened this way: They were out at a certain factory in Cleveland examining a new and much talked of car recently built for record breaking, and with which it is hoped to capture the Gordon-Bennett Cup, when its builder and driver volunteered to take them downtown. For several reasons, some of them obvious, it is best that names be not mentioned.

They accepted the invitation with alacrity, supposing, of course, that the driver would not dream of "letting it out" within the city limits. The factory in question is located away on the outskirts and just beyond some railroad tracks. From the tracks an asphalted street fully a mile long stretches invitingly into the distance. The giant motor was started, one of the Motor World men jumped up beside the driver while the other curled up behind, hanging on to the back of the seat. In a moment the clutch was thrown in, the machine fairly bounded over the tracks, and before even a coat could be buttoned or a hat pulled down tight the great car was plunging into space. A dull roar like a tornado, a sudden catching of the breath, then water fairly running down the cheeks in a half blinding way, a confused shooting past of houses, trees and open lots; then a grinding, tearing sound, and a slow-up to round a corner gave a chance for breathing and for protest. The only answer was a chuckle, and in response to the query as to how fast we had been travelling a careless, "Oh, a little over sixty, that's all."

"Well, for heaven sake don't try it again," only brought another chuckle and a grin.

A moment later and he was at it again; this time the passengers huddled up close and held on for dear life, but it didn't seem quite so bad or goose flesh raising.

Suddenly a coal cart, which had leisurely been crawling along far ahead, suddenly loomed ahead and turned directly across the street. There didn't even seem time enough to jump, when the little finger at the wheel seemed to act automatically, the big levers were reversed, and the brake was on quick as a flash and before the brain had time to think. The big machine came to an almost sudden stop, yet without any shock, and just missed the car by an inch or so. This performance was nearly productive of a hemorrhage to the man sitting in front, yet he could not but admire the supreme skill and nerve of the driver beside him. The latter took the incident as a matter of course, and when queried regarding his instantaneous action replied with superb sang froid, "Oh, it's more a matter of experience than anything else. The man accustomed to travelling at great speed gets in the habit of acting intuitively. He has to, for he hasn't time to think."

But the streetcars or an ordinary automobile will probably carry the guest back to town from that particular factory in the future. It may take more time, but it will be cheerfully given. And yet the experience would not have been missed. At least one of the men feels much the same as he did after going through for the first time the Cave of the Winds under Niagara Falls: Wouldn't have missed it for the world, but would not go through it again for the universe.

It all seemed daredevilish, but reckless, subject to severe censure and all that, yet it is of such nerve and control that will enable this country to dim the lustre of the Fourniers and the Old World's greatest cracks as much as anything else.

Why he Favors one Brake.

"Two brakes are better than one, they tell me, and I have no doubt that it is true. But for my part I'll take one brake that I know is all right in preference to two that are doubtful," remarked the autoist to the Motor World man.

"Perhaps I have been unfortunate with cars having two brakes, and just the reverse with the one brake kind. Any how, I have always found that with the latter I keep the brake in perfect order, ready to bring the car to a stop whenever I jammed the brake on hard. I always knew what to expect, and never did it disappoint me. But with two brakes I was always having narrow escapes. The brake I used regularly might become worn a little and need adjusting. 'Next time I will fix that,' I would say to myself, and then put it off to a more convenient season, always reflecting that I had the emergency brake to fall back on. Then if I did have to make use of the latter it was never just right. Disuse interferes with efficiency, and the only way I have ever got service out of an auxiliary brake was to make use of it at regular intervals.

"Two brakes are all right if they are used constantly, but otherwise they are apt to prove a delusion and a snare."

Sold his Order for $2,000.

An Irish autoist, Dr. Colahan, of Dublin, has made a nice "bit" out of a Mercedes racing car which he had on order. The latter was placed last year, and a short time ago he was offered $2,000 premium for his bargain. He accordingly turned it over to the bidder, thus undergoing disappointment, but pocketing this nice little sum.

WASHING THE CAR

Why Soapy and hot Water Should be Firmly Tabooed—Care Necessary in Other Respects.

There are many men who, though good mechanics, have no idea as to the care required in washing a carriage body. Carriage varnish is a very delicate substance, and should be treated with extreme care. It is not generally known that it is susceptible to light and heat, both of which have a softening and dulling effect upon its surface. It should be carefully noted, therefore, that the house in which the car is stored is not subject to any strong rays of light striking through its windows directly on to the carriage. The house should also be dry and well ventilated. In any case, it is always best to keep the car covered with a large sheet when it is stabled.

A newly varnished car should stand for at least a week before being taken into regular use. This is in order to allow the varnish to set properly. Frequent washing with clean cold water and careful drying with chamois leather and exposure to fresh air in the shade will both harden and brighten the finish. On no account allow mud to remain long enough upon a newly varnished carriage to dry. If this is done stains are bound to follow, and when once they have set into the varnish nothing will remove them.

In washing a carriage plenty of water should be poured carefully over the parts; it is always a mistake to use a swift flowing hose jet. It is really better to use a large sponge, well saturating it and squeezing it over the panels of the car body, when the water in running off will carry the mud with it. Never allow water to dry on the carriage, as this is very liable to stain, almost as much so as mud. Hot water and soap should never be applied to any varnished or light colored painted surfaces.

Water in the Carburetter.

When the spray chamber of a carburetter is opened droplets of water are often found adherent to its walls. This frequently causes needless mental perturbation to the novice, for water in the carburetter is usually held up to him as one of the bogies of the motorist, and that it is so is true enough, but only if the water is present in the spray chamber in considerable quantity, or in the float chamber, and has free access to the spraying nozzle, which it may block. The vaporization of gasolene in the spray chamber produces a very low temperature, and the presence of water (which should be periodically soaked up with blotting paper) is due to condensation of moisture from the air drawn in. This has no appreciable effect on the running of the motor, unless allowed to accumulate for some time.

ABOUT BATTERIES

The Lechanche as an Illustration—Its Components and how They Act.

The battery, which is most familiar to the non-technical public, is the "Leclanche," such as is used for electric bell work. This battery is a recuperative one, and may run without attention for months, though if its circuit be closed for a length of time it will polarize or cease to give current until a further rest is allowed, when it will be restored to something like its original energy.

In the "Leclanche" cell the element is a zinc rod, the exciting fluid a solution (semi-saturated) of sal ammoniac, and the depolarizer oxide of manganese. The construction is an outer glass jar containing the liquid, the zinc rod and the porous pot in the centre. The porous pot, as its name implies, is a vessel through which water percolates slowly; in the centre of the porous pot is a carbon rod forming the positive plate of the cell, and around this carbon rod is packed crushed carbon and oxide of manganese, the whole being sealed up with pitch. In action the sal ammoniac attacks the zinc rod, the current flows through the liquid and the porous pot, and is drawn off at the carbon terminal.

When the circuit is closed for a length of time the current becomes feeble through certain chemical changes taking place; on opening the circuit current ceases to flow, and the oxide of manganese restores the original condition. This action of the battery continues until one or other of the component substances run out, usually the manganese or the sal ammoniac, or, if in a warm place, the water, by evaporation, so that to restore the action the missing substance must be added.

Each "Leclanche" cell, when new, gives a little over two volts, and quantity according to size of cell, and it may be noted that, no matter what the size of any particular form of cell may be, its voltage will be the same, thus, a quart cell, and another the size of a thimble, would each give the same pressure, but the quantity of current would be entirely dependent on the size of the cell, or, rather, the size of the elements and quantity of other contents; thus, for motor work, where it is necessary to make all as compact as possible, the cell is usually square, and contains the maximum quantity of each ingredient in the form of a dry cell. The ordinary "Leclanche" described is unsuitable, on account not only of the water splashing about, but by reason of its extra weight and bulk as compared with the dry cell, which, however, is merely a modification of the wet cell.

In the dry cell a cylinder of zinc is used, thus exposing a far larger surface of zinc and giving a correspondingly heavier current. The zinc cylinder is surrounded by plaster of paris and sal ammoniac, and the depolarizer is crushed carbon and manganese, as in the wet cell. Size for size of outer dimensions of cell much heavier currents may be drawn from the dry cell, and for longer periods on closed circuits, but the total depreciation is more rapid, and the renewal of any individual constituent impracticable.

Justice in Far Away Ceylon.

There's no nonsense about a certain Ceylon official who was called on to pass on the automobile versus the horse. It appears that at Colombo the driver of a steam vehicle was "summoned" for frightening a horse by the emission of steam, and the Commissioner of Requests in the course of his judgment said:

"Horsed carriages have no greater right to the use of public roads than motor cars have, and it is not inconceivable that at some distant date they will be as extinct as sedan chairs are now. The discharge of steam when a certain pressure is reached is automatic and beyond the control of the defendant. The defendant in this case, so far from displaying negligence, seems to have exercised particular care, for he stopped the car when he saw that the plaintiff's horse was getting frightened, and when the accident occurred the motor car was stationary.

"I see no more reason why he should be mulcted in damages than why the first man who used an umbrella in London should have been assaulted by the mob, as he was. The defendant was driving a legitimate vehicle in a legitimate way, and I cannot, from my point of view, hold him legally responsible for this accident."

"Justice" in Maine, U. S. A.

"It would seem from the verdict given on Saturday last in the automobile case that a man driving an automobile has no apparent rights on our public streets," writes H. M. Jones, of Portland, Me., to the Press of that city,

"A man may be a taxpayer and pay for street privileges, and while enjoying these rights in an automobile he drives into the gutter to let a horse pass that is going ten or eleven miles an hour; the horse bolts, smashes the team, and the automobile driver is, according to the above verdict, held responsible for damages. The person owning the horse is allowed to drive in the streets, and with such an animal can go to the Western Promenade and in company with others race back and forth to the danger of those who are out for a pleasure drive, and nothing is said.

"I am not protesting against the horse racing, as I believe that those who enjoy the sport should have the privilege of so doing; at the same time I do not think it just that a person should have the right to charge the damages caused by a dangerous horse to those who enjoy another kind of riding, and who take precaution against frightening horses or those driving them."

INDUCTION COILS

Some of the Conditions That Make for Proper Sparking—As to Plugs.

The successful action of the induction coil and its trembler depends largely on a rapid break, and tremblers on the principle of the Charpentier are being widely adopted. The principle of all these lies in mounting the armature that is attracted by the core of the coil on a weak spring, while the contact points are on another spring separate from the former. The armature, on being attracted, does not touch this latter till it has partially completed its travel, and so is already moving fast. Thus a more rapid break and more powerful spark is obtained. In the Eiseman system a magneto generator is substituted for the acumulators, the current being sent in the ordinary way through a coil.

It was not, however, necessary to have a coil, or rather the secondary winding, as on breaking the primary circuit a high-tension current was induced in it. To utilize the spark from this, however, the break had to take place in the cylinder itself, and this is the principle of the magneto ignitious, most widely known and used. In the reciprocating form of this a coil of wire is alternately screened and exposed to the magnetic flux of a powerful pair of magnets by an oscillating screen of soft iron. The break in the cylinder is adjusted to take place as the screen begins to uncover the coil, the result being a powerful and efficient spark. With regard to sparking plugs, a broad surface of insulation inside, whether obtained by grooving the porcelain or otherwise, diminishes trouble from fouling. Sparking across the outside surface, sometimes troublesome in damp weather, may be cured by the application of vaseline.

One Cause of Poor Compression.

After grinding in the exhaust valve the compression is sometimes unaccountably poor. This may be due to uneven grinding, so that part of the valve does not fit closely to the seating. To test this smear the seating with a tin film of oil colored with red lead and place the valve gently in position. Now remove the valve, and notice whether the colored oil is uniformly distributed round it. If any part is left uncovered this indicates the badly fitting portion, where the leak of compression takes place. The valve must then be reground, the operator's pressure being so distributed as to remedy the defect.

The Week's Exports.

Cuba—2 cases motor vehicle material, $18.

Colombia—1 case motor vehicles and material, $148.

Hamburg—4 cases motor machinery, $800.

Havre—1 case motor vehicles, $165.

Liverpool—4 cases motor vehicles, $5,500.

London—23 cases motor vehicles and material, $19,134.

Mexico—1 case motor vehicles, $1,000.

ELECTRICAL ECCENTRICITIES

Some Observations Growing out of the Recent Sparking Discovery Abroad.

"The discovery made by Messrs. Panhard and Levassor illustrate very strikingly the behavior of electrical discharges such as occur between the terminals of a secondary coil, between the coatings of a Leyden jar or in a lightning discharge, and the explanation of the action is a very simple one," says a correspondent of the Autocar.

"It should be remembered that the discharges from a secondary coil, or from a Leyden jar or other condenser, are not the same as the usual form of electric current such as we use in our incandescent lamps, motors, etc. When we allow a spark to pass across the terminals of a secondary coil we see apparently only a single discharge, a flash, larger or smaller, according to the amount of energy passing, and that is all; and we are apt to imagine that what we have seen is simply a form of current and nothing more. Really, it is a succession of waves giving rise to a succession of other waves in the ether, the sets of waves passing alternately in opposite directions.

The discharge is oscillating—that is to say, there is a discharge in one direction followed by a counter discharge or recharge—a surge backward, in the opposite direction, followed again by a discharge in the first direction, and so on, till the whole of the energy available for the discharge has been dissipated. The action is, in fact, similar to that of a pendulum, which, when set in motion in one direction, swings back to the point from which it started, then moves to a certain height in the opposite direction, returns to the vertical position, then moves to a certain height in the first direction, returns to the vertical again, and so on.

"As is well known, if allowed to do so, the pendulum gradually comes to rest, each swing in each direction being over a smaller arc than the previous one. We know also that the reason the pendulum swings over past the vertical to a position on the opposite side is because of the momentum acquired in falling from the position to which it was first propelled. We know also that if, instead of allowing the pendulum to come to rest, we give it a second impulse at a certain point of its swing, in the same direction as the first, or in the direction in which it is going at the moment, its swing may be increased and the motion may be maintained for a much longer time than would have been the case if no second impulse had been given it. In fact, as our clocks tell us, the motion may be maintained indefinitely, provided that a succession of impulses are imparted at the right moment.

"Also we know that if, instead of imparting the second impulse at the right moment, when it accelerates the motion of the pendulum, we impart it against the direction in which it is moving, the second impulse tends to bring the pendulum to rest sooner than would have been the case if left to itself. The opposing force of the second impulse uses up some of the momentum acquired in falling—provides negative acceleration, in fact. The same thing takes place with electrical discharges from condensers. If there are two discharges or similar actions taking place in the same circuit, as in the case of the secondary coil if the two discharges are in unison, in time, the oscillations are added together just as the impulses imparted to the pendulum are, with the result that a much higher pressure is reached, and discharges may take place over a space that would not have been possible with only the one discharge in the circuit.

"It will have been noticed from the experiments that a certain length of spark in the additional spark was necessary or the result was not obtained. This means that it is necessary to have the sparks—the waves which form the discharge—in unison, assisting each other, not retarding. The waves forming the second spark must not be passing in the opposite direction to those of the first spark or damping will result; and this method is employed in some cases in electrical work where damping is desirable. It is possible, of course, that the waves of the two sparks may not travel the whole distance together, but the amount of opposition must be so small as not seriously to reduce the total acceleration."

Why Pneumatic Tires.

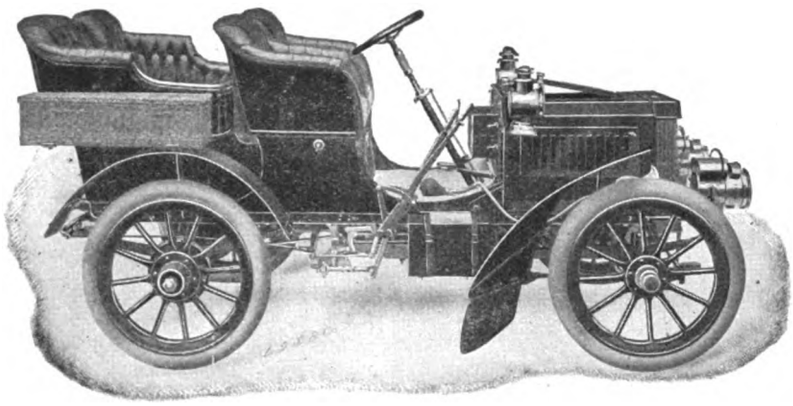
In their report on the tire trials held last September, the judges of the Automobile Club of Great Britain summed up the respective merits of pneumatic and solid tires. "It is claimed for the pneumatic tire that by its great resiliency and consequent reduction of vibration, the engine, gear and carriage work are preserved from the constant succession of shocks from road contact which must arise from speedy travelling over the highway; and that consequently cars shod with pneumatic tires are not so liable to breakdown from engine, gear, or frame failure, and the life of a motor and carriage is considerably prolonged, while the comfort of riding and facility of steering are greatly increased," they say.

"It is beyond argument that the reason why motor owners incur the very considerable additional expense which is involved by the employment of pneumatic in preference to solid tires, and are willing to suffer the delays and annoyance which may arise from puncture of pneumatic tires, is because of the additional speed and general smoothness of running which result from the property of absorbing obstacles, which is the main characteristic of a pneumatic tire. It is possible to manufacture a pneumatic tire which is practically unpuncturable; but if, in order to avoid puncture, the tread and walls of the tire are so thick and so unyielding, and therefore sluggish, that the tire fails to absorb concussion better than the solid rubber tire, nothing is gained by the use of such semi-solid tires."

MALTA AS A MARKET

Opportunities that Exist, Motor Wagons Being Among Those Wanted—Influence of Catalogs.

"There are already several automobiles in use, and correspondence is now being carried on between probable purchasers and American makers," writes Consul Grant from Valletta, Island of Malta. "One gentleman recently went to England and, after looking at the various makes of machines there, ordered one of American origin, which is giving good satisfaction. This machine is of the steam variety, being the only one of its kind here. The others are operated by gasolene. One firm desires to secure large vans for delivery of goods. No fault is found with gasolene machines except that it is somewhat difficult at times to procure gasolene, on account of local laws. It is imported from New York and other places, but the supply is apt to be limited.



"American manufacturers of automobiles should bear in mind that Malta does not possess, as a rule, long, level stretches of road. There are many steep hills—some of them having a grade of 1 in 9. The machine should be much more powerful than is the rule in the United States. Another thing to be remembered is that, in giving price, the manufacturer must quote f. o. b. New York; otherwise the inquirer will not know what his machine is going to cost him. Peole here know nothing about distances or freight rates between ports of shipment and our interior cities. Several negotiations have failed because the dealer in the United States insisted upon quoting prices f. o. b. Chicago or other place of export. When possible, it is even better to give prices c. i. f. Malta. In other words, when the buyer at Malta writes for terms, he should be given information which wil enable him to figure exactly what the machine will cost him, landed here. If information as to the cubic measurement of the machine as crated or boxed for shipment can be given, it will add to the satisfaction of the buyer.

"Some time ago an American carriage manufactured in one of our interior cities was sold here, and, to my own knowledge, one of the greatest points considered was the completeness of the information given in the catalogue. I provided other catalogues, which were prepared in attractive style and showed desirable goods, but information as to terms, etc., was very meager and they were not considered. It must be remembered that transportation from New York to Malta is now ample by way of a direct line of steamers.

"My assortment of automobile catalogues is somewhat limited, and I should be pleased to receive such as manufacturers may see fit to send me."

The Goodyear Tire & Rubber Co., Ltd., has been registered in Great Britain. Its capital is $25,000.

THE CHAUFFEUR'S STORY

What it Means to Operate a Car in a Big City —Parts the Police Play.

Some people think it a cinch to operate an automobile in the city," remarked the chauffeur plaintively, "and others don't give a fellow credit for doing anything except when he runs down somebody. Then he gets it in the neck and everywhere else. Probably the life of a chauffeur isn't quite what it's cracked up to be. Certainly I don't think so after trying it for one summer and winter. I used to be a driver on one of the old horse cars that ran up the Boulevard before they tore the subway up; then I took a job as motorman on the Third avenue line, and I would have been there to-day if it hadn't been for these automobiles. When they came along I thought I could better myself, and I took lessons in running them, and here I am getting my $60 a month and board. It seemed like a cinch at first to me, but that was before I knew.

"When anybody tells you it's fun to make a living doing this sort of work put him down for a greenhorn. What with the cops watching your speed, and the mobs of kids ready to besiege you if you touch one of their number, or run too close to some old woman who can't see or hear, and the magistrate ready to fine you for doing nothing wrong, life isn't as pleasant as it might be. I was nearly mobbed on the East Side the other day just because I ran close to a kid who jumped from the curb right in front of me. The crowd that got around me said that I was running at a reckless speed, and they looked as if they wanted to lynch me. For once the policemen were my good friends, and they rescued me, driving the mob back with their clubs.

"Do you know, it's as much as a chauffeur's life is worth to go down some of the East Side streets? If you go slow the kids pile on the automobile from behind, and if any one tumbles off you are blamed for it. If you run fast to get away from them somebody starts up a cry that you are running faster than the law allows. Then at the corner a cop will nab you, and up you go. Now, what is a man going to do in such a case? My plan is to keep away from the East Side, where an automobile is looked upon as some sort of a thing to stone and kill as soon as it appears. As luck would have it, I don't have to go over there very often, and so I'm relieved of that terror.

"But there are other things pretty nearly as bad. In Central Park and Riverside Drive every policeman—mounted, bicycle and foot cop—is the declared enemy of the chauffeur. Why this is so I can't tell. I suppose it's because some reckless fellow does once in a while run up against it and forgets to shut off his speed in time. Just now there is so much feeling against automobiles that every policeman considers it his duty to arrest one to keep popular with headquarters. There isn't anything easier to make out that you are doing something than to arrest a chauffeur and charge him with running his machine at too great a speed. How can the policeman tell how fast the machine is running? He must guess at it, and there isn't any proof, and so the judge accepts the cop's story and turns down the chauffeur's. I hope they'll soon invent something to put in the automobile which will indicate the speed one is travelling at, and then when the smart cop comes along and arrests you he'll be shown up in fine style.

"Well, as I was saying, it is hardly safe to run faster than five miles an hour in Central Park or Riverside. That's about the limit. If you go much beyond that somebody will say you were travelling at fifteen or twenty miles an hour. I was only arrested once for fast speeding, and then I wasn't going more than ten miles an hour. When the cop took me up I asked him if he knew how fast I was going. He said he did, but I knew better. Then I asked him to let me show him what fifteen miles an hour was like. Well, sir, he let me, and I put her through, but I didn't stop at fifteen. With a bluecoat alongside of me I thought I'd have one good spin. I just let her out and sped down the drive at twenty miles an hour. The cop grasped his hat and gasped for breath, and told me to slow up. I pretended not to hear. A bicycle cop was soon chasing us, but I kept right on, and ten minutes later there was a double arrest. But I was not alone in this. The policeman at my side had to go along, too. It soon turned out that the bicycle policeman was his enemy, and he took delight in telling his story to the magistrate. It did me good to get him in a little trouble, too. I had the fun of showing the cop how fast an automobile could go, and I don't think he'll take another free ride with a chauffeur after he arrests him.

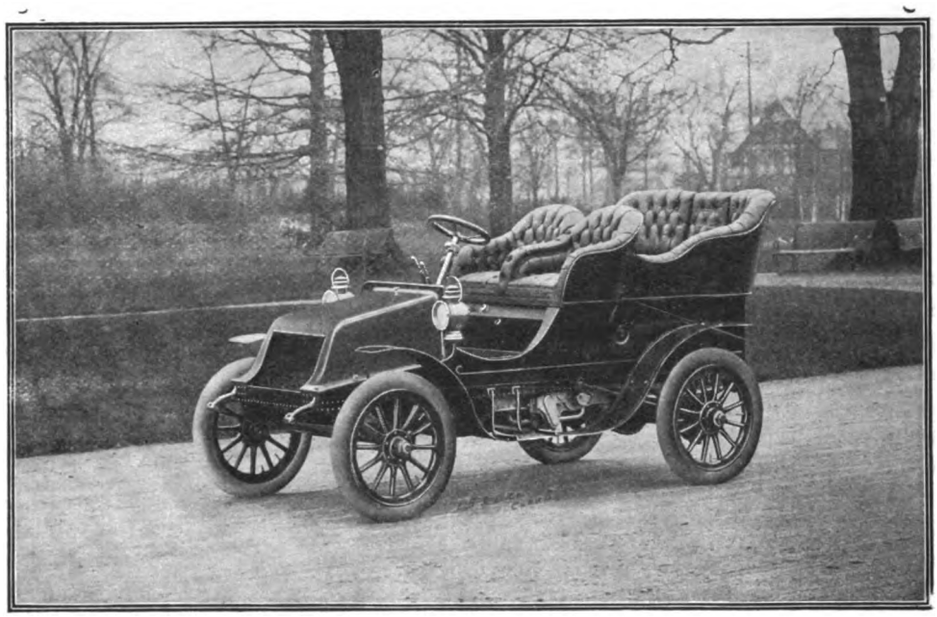
"But the best case of this kind I ever had was out on Long Island. One of those fellows who measure the roads and sets a time watch against you, took me up one day. He was one of these smart country policemen who thinks he knows it all, and he ordered me to go along with him to headquarters. I told him to jump in, and then I turned the machine toward New York. He protested and threatened, but it wouldn't go. He didn't know anything about running automobiles, and he couldn't save himself. I put on a good speed, and we covered more than twenty miles an hour on some of the good roads. Several times he shouted to passing pedestrains, hailing them and calling for help. I guess they thought he was a lunatic or a drunken man, and they only laughed.

"I brought him to the city and then released him. He didn't have any authority to arrest me in Brooklyn, but he had my name and number, and, of course, the court's summons. However, I had my fun out of it, and that was what I was after. You may just as well be killed for a sheep as a lamb. When a fellow is arrested for nothing he's bound to get all the fun out of it possible. I think that's the way the chauffeurs in the city feel. The public is against them, the cops run them down whenever they can, the judges give it to us when they have the chance, and now I hear the legislators at Albany are going to increase our fines and make it harder for us. Say, it won't be such a cinch then to be a chauffeur, will it? But, then, of course, the harder they make it for us the higher our wages must me, and maybe in time we'll get enough for me to retire before I'm an old man."

AWAITING HIS MASTER'S CALL.

"Idiocy of the Crusade."

It is a good sign to see a glimmering of sense like this from the Lowell (Mass.) Citizen:



"Whether or not drivers of automobiles ought to be licensed, as is proposed by a legislator, is doubtful. Some day it will probably be as absurd as it would be now to require every driver of a horse to be licensed."

Some day the idiocy of this whole crpsade against automobiles will become plain. However disguised, it is really but a form of the widespread resistance to progress of any sort that has marked the tories of all ages. They would, if they could, prevent all progress. But automobiles are another, and a most important, step in the direction of anihilating distance, and, like Stevenson's locomotive, it will be bad for the bovine-minded individuals who get in its way.

If ever a car made a good impression wherever introduced, and won out on its merits, it is the Oldsmobile. In speaking recently of cars that run quietly on slow speeds, as well as on fast ones, the Autocar cites the Oldsmobile as a conspicuous example

$2,500

WILL YOU

pay two thousand, five hundred dollars for a genuinely good automobile which represents the present highest standard of excellence in design and manufacture?

If you do not appreciate the vital difference between superficial perfection and construction that is honestly good and thoroughly scientific from wrist-pins clear out to the last coat of finishing varnish, then you will not be especially attracted by the new twenty horse-power

WINTON TOURING CAR

We hope, however, that you will recognize our latest successful efforts and accord this new model the consideration it deserves. You who have been conscious of the rapid development of the successful American automobile, who have watched it through its various stages since the time—years ago—when Mr. Alexander Winton ran upon the roads his first "horseless carriage," will recognize the great strides we have made toward the goal of perfection in automobile building, and can appreciate in no small sense the genuine pride we feel in this latest triumph.

It is not intended as a "sensation." It does not incorporate a vast number of rare features for which we, in justice, can claim no more than theoretical excellence. Its construction does not embody a vast number of untried experiments, and we do not, therefore, ask anyone to share in a manufacturer's gamble. In presenting this model we give the very essence of practical and thoroughly tried out experience.

Consider the matter of delivery: During the current season we will be able to manufacture just one thousand of these twenty horse-power Winton Touring Cars. A liberal percentage of the total output has already been sold. Supply will not meet the demand, of this we are quite sure. Would it, therefore, not be an act of wisdom to file your order early and allow some one else to be disappointed as the result of procrastination?

Keeping the Lamp Clean.

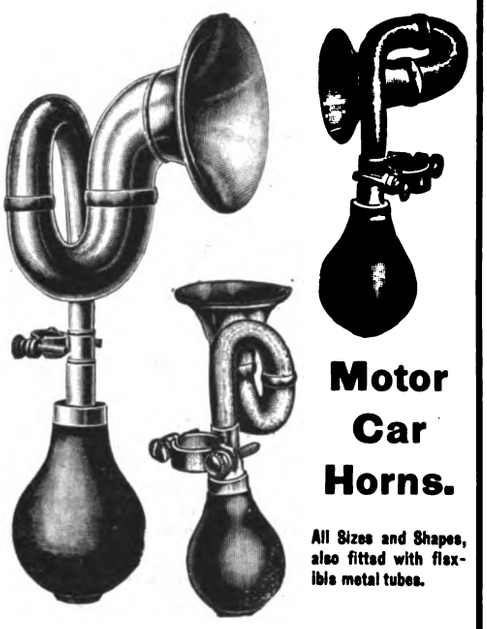
Every one who has given the matter attention knows that acetylene gas lamps must be looked after carefully to give good results. The trouble, when it occurs, usually lies in the lamp not being kept properly cleaned or through being improperly charged. To keep the lamp at its best light giving powers, and to give the least trouble, clean water should be put into a tank every time the charge is renewed, and not merely fresh water added to that already contained in the tank. Fresh carbide should be put into the generator, and should there be any remains of the previous charge this should be removed and carefully cleaned of all the free lime which may have accumulated around it. The deposit left by the dissolution of the carbide should be thoroughly cleaned out, the generator being washed and dried before the new carbide is put in. The burner should be kept perfectly clean, and the small holes are best kept free by using the wire pickers which are usually supplied with the lamps, and then by clearing out any of the carbon deposit by attaching it to the tube of a tire inflator and well blowing through it.

Automatic vs. Mechanical Intake.

It has been urged as one of the great advantages of the mechanically operated inlet valve that the valve must be of necessity open at the correct moment, when the piston begins descent, whereas, with the type operated by suction, the valve cannot open until the piston has descended a short distance. This is perfectly true, but it must also be borne in mind that a cam can only come into action gradually, and consequently that the inlet valve is not fully opened until the piston has descended a short distance, whereas the automatic valve, when it begins to act, opens practically instantaneously. Therefore, on this score, the advantage in favor of the mechanically operated inlet valve cannot be great. If the cam should wear it will have an effect on the timing of the valve, and to put this right will be beyond the power of the owner, as it is a workshop job. Of course, such wear should not take place for a considerable period.

Inspect the Steering Gear.

No part of an automobile is more vital, from a driver's point of view, than the steering gear, for a failure leaves him suddenly and absolutely helpless, and if the speed is fast and the road a dangerous one a very serious accident may occur. For this reason the connections should be inspected regularly and carefully. As a rule, the nuts securing the various joints are strongly pinned, and as long as the pins are in position they cannot drop off. They should be glanced at before each run. If there is no safeguard of this description the autoist should make a point of attaching some arrangement which would secure the connections, no matter how loosely, should they come adrift, so that the car could be steered long enough to enable the driver to pull up. This ought to be comparatively easy.



To Prevent Short Circuits.

Electric terminals which happen to be in such a position as to be subjected to water or mud accumulating upon them can be effectually prevented from possible short circuits by painting them with a varnish composed of ordinary red sealing wax dissolved in a little gasolene. This varnish is made by putting into a small bottle a quantity of small pieces of sealing wax, covering the latter with spirit and occasionally shaking it. If the varnish should prove too thin, add a little more wax or leave the cork out of the bottle until some of the spirit has evaporated. If it is too thick, add sufficient spirit to bring it down to the required consistency. For those who do not care to go to this trouble, a little melted paraffin wax can be used for the same purpose. Either of these methods is as satisfactory as binding with insulating tape.

The Best Compression.

No definite opinion as to the best compression pressure to use can be given, as conditions vary so much, but five atmospheres, or 72½ pounds to the square inch, is generally regarded as the limit of useful compression.

To arrive at the cubic capacity of the compression space in a cylinder multiply the area of the bore in inches by the stroke in inches; then multiply the result by 14.7 atmospheric pressure, and divide by the compression in pounds per square inch required.

Motor Car Horns.

All Sizes and Shapes, also fitted with flexible metal tubes.

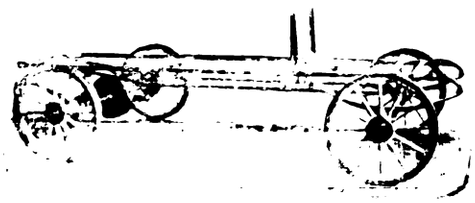
MANUFACTURERS OF

GASOLINE MOTORS, DIFFERENTIAL SPUR GEARS, TRANSMISSION GEARS, TUBULAR RUNNING GEARS, RADIATING COILS, MUFFLERS, ALUMINUM AND BRASS HOODS, WOOD AND WIRE WHEELS, CARBURETERS.

WYOMA GASOLINE MOTOR

Single Cylinder, 8 H. P., 135 pounds
Double Cylinder, 14 H.P., 205 pounds.



Our Motors are of French Type, Water Cooled, and Equal in Finish and Service to Best Foreign Makes.

WYOMA DIFFERENTIAL SPUR GEAR

8 pitch, — 60 teeth.

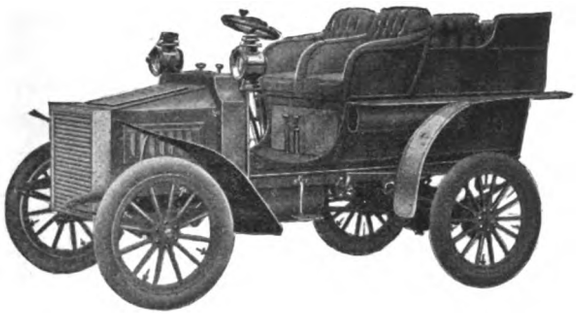
The Differential Gear has Manganese Bronze Bevel Gear. Fitted for either 1¼, 1⅜ or 1½ inch axles. Is made for Direct Drive, Rod Transmission, and also with Chain Sprocket.

TUBULAR RUNNING GEAR FOR TONNEAUS.

80-inch Wheel Base. 54-inch Tread.

The transmission Gear is built on a new system. No Bevel Gears. Gears always in Mesh. Ball Thrust at each end of Shaft. Enclosed in Aluminum Case. Will transmit up to 20 H.P.

We make a Tubular Running Gear for Tonneaus that is a marvel of workmanship, finish and construction. All material is of the best and the Bearings are extra heavy. The Differential on this is fitted for either Sprocket or Bevel Gear.



WYOMA TRANSMISSION GEAR

3 Speeds forward and 1 Reverse.

Digitized by Google

The NEW WHITE Steam Tonneau for 1903.

AN AUTOMOBILE THOROUGHBRED.

In the 500-mile Reliability Contest from New York to Boston and return, arranged by the Automobile Club of America, three **WHITES** covered the distance without stop or trouble of any kind—a perfect performance.

The White Steam Generator is absolutely non-explosive, gives pressure in five minutes from cold water, and once in motion is self-regulating. In touring, the **WHITE** will make 100 miles without adding a drop of water or fuel to the original supply.

Write for full particulars, including Prof. Thurston's report on our steam generator, and the official reports of important endurance contests.

WHITE SEWING MACHINE CO.,

WALTER C. WHITE, European Representative,
19 Princes St., Westminster, London, England.

THE HAYNES-APPERSON

is unique. It is its own type. It has proved the best for American roads, better than foreign types—better than the so-called "American type" of motor car. It is the oldest make in America—one of the oldest in the world—the most thoroughly developed.

It is interesting to note that the 1903 "Improvements" of the Paris Show have all been features of the Haynes-Apperson Car for years. Our throttle control and sparker with magneto is superior today to the best foreign practice; also our band clutch, free from end-thrust.

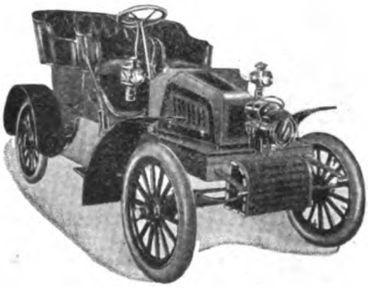
We have issued (in addition to our regular catalogue) an interesting booklet that tells why it is the best. Shall we put you down for one? You will greatly oblige us by naming THE MOTOR WORLD when you write. Catalogue free, too.

Runabout, $1200; Phaeton, $1500; Surrey, $1800.

TONNEAU—READY BY SPRING—PARTICULARS LATER.

HAYNES-APPERSON CO., Kokomo, Ind., U.S.A.

"Eastern representatives, Brooklyn, Automobile Co., 1239-41-43 Fulton Street, Brooklyn, N. Y. New York Location to be announced later."



THE SHELBY MOTOR CAR CO.

MANUFACTURERS OF

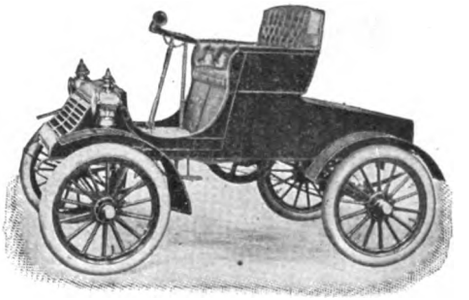
The Shelby

GASOLENE 10 AND 20 H. P. CARS.

OUR MOTOR. Two PISTONS in one CYLINDER; takes charge in the center, forcing both pistons in an outward direction, reducing vibration to a minimum. Over 40% better efficiency than in a single acting motor.

This is only one of the many superior points found in the SHELBY CARS. For further particulars,

Address Department "F"



THE SHELBY MOTOR CAR CO.,

SHELBY, OHIO.

YOU

have no idea how much good there is in an

AMERICAN GASOLENE AUTOMOBILE

Why not look into the matter, and get the most solid comfort possible at a minimum cost? You wont regret it. The best material money can buy goes into the construction of this GUARANTEED SUCCESS.

You will be interested in terms to agents. Write for catalogue.

The Week's Patents.

719,615. Support for Rubber Tired Wheels. Wilhelm Schulze, Gera, Germany. Filed May 15, 1902. Serial No. 107,383. (No model.)

Claim.—A support for rubber tired wheels comprising two curved blocks one of which is provided with a transverse slot and a plate on its outer face projecting slightly into said slot, a toothed plate pivoted to the other block passing through the slot and normally spring-pressed into engagement with said plate, a pin at the outer end of the blade to prevent the entire separation of the blocks, and springs mounted in sockets in the inner faces of the blocks, normally pressing the blocks apart substantially as described.

719,660. Electric Battery. Henry Halsey, New York, N. Y., assignor, by mesne assignments, to Halsey Electric Generator Co., Jersey City, N. J., a corporation of New Jersey. Filed Apr. 18, 1902. Serial No. 103,642. (No model.)

Claim.—In a battery, the combination with the electrolyte and the elements, of means for maintaining movement of one of said elements, and means for freeing the electrolyte from precipitates, substantially as described.

719,670. Steam Boiler. Henry A. House, jr., Hampstead, England. Filed Feb. 25, 1902. Serial No. 95,595. (No model.)

Claim.—1. In combination with a steam boiler, a removable vessel b having a plurality of openings near the upper end thereof and a feed water pipe depending vertically within said vessel, said pipe having a closed lower end and a plurality of openings in its wall, substantially as described.

719,806. Controlling Means for Motor Vehicles. Daniel E. Johnson, Hartford, Conn., assignor to Frederic C. Billings, Hartford, Conn. Filed Apr. 11, 1902. Serial No. 102,430. (No model.)

Claim.—1. A motor vehicle containing power governing means for governing the application of motive power to the vehicle, means for controlling the same, and separately operated braking means for the vehicle adapted respectively to cut off and on the power rendered available by the controlling means upon application and release of the brake.

719,822. Motor Vehicle. Shirley S. Lewis and Albert Lewis, Syracuse, N. Y. Filed Nov. 23, 1900. Serial No. 37,429. (No model.)

Claim.—1. In a motor vehicle, the combination with the front and rear axles and a transverse and convex bar on each of said axles curving upward of two longitudinally extending reaches, comprising a lower and an upper bar suitably secured together, and transverse crosspieces connecting the two upper bars and the two lower bars of the reaches with each other, substantially as described.

719,836. Gas Engine Lubricator. Harry Morningstar, Detroit, Mich. Filed Nov. 18, 1901. Serial No. 82,623. (No model.)

Claim.—1. In a lubricator of the character described, the combination with the cup, of a hollow leg depending from the bottom of the oil cup and communicating directly with and forming an extension of the oil space of the cup, a discharge arm secured to the lower end of the leg having a passage through which the oil is dascharged from the lubricator, a pipe extending from said passage upwardly through the oil space into the space of the cup above the oil, and a sight feed having a glass tube located alongside the leg and substantialy coextensive therewith and provided with an oil inlet leading from the bottom of the leg into the bottom of said sight tube and terminating in a drop nozzle projecting vertically in the axis of the sight tube and an oil outlet leading from the top of the sight tube at or about on a level with the bottom of the cup into the discharge arm, the upper end of said sight tube being provided with a fill-opening for filling the tube with water.

719,855. Stroke-Varying Mechanism for Explosive Engines. Albert F. Parks, Brooklyn, N. Y. Filed Jan. 23, 1902. Serial No. 90,913. (No model.)

Claim.—1. The combination with a pair of connected cranks, of a pair of connected differential eccentrics loosely mounted on said cranks, and a pair of elements coacting respectively with said eccentrics and controlled thereby.

719,937. Storage Battery. Bruce Ford, Philadelphia, Pa., assignor to Electric Storage Battery Co., Philadelphia, Pa., a corporation of New Jersey. Filed Dec. 19, 1902. Serial No. 135,902. (No model.)

Claim.—1. In combination a cell containing an electrolyte and its complemental elements, separators buoyant in the electrolyte, and a holder arranged above the separators to prevent their rising, substantially as described.

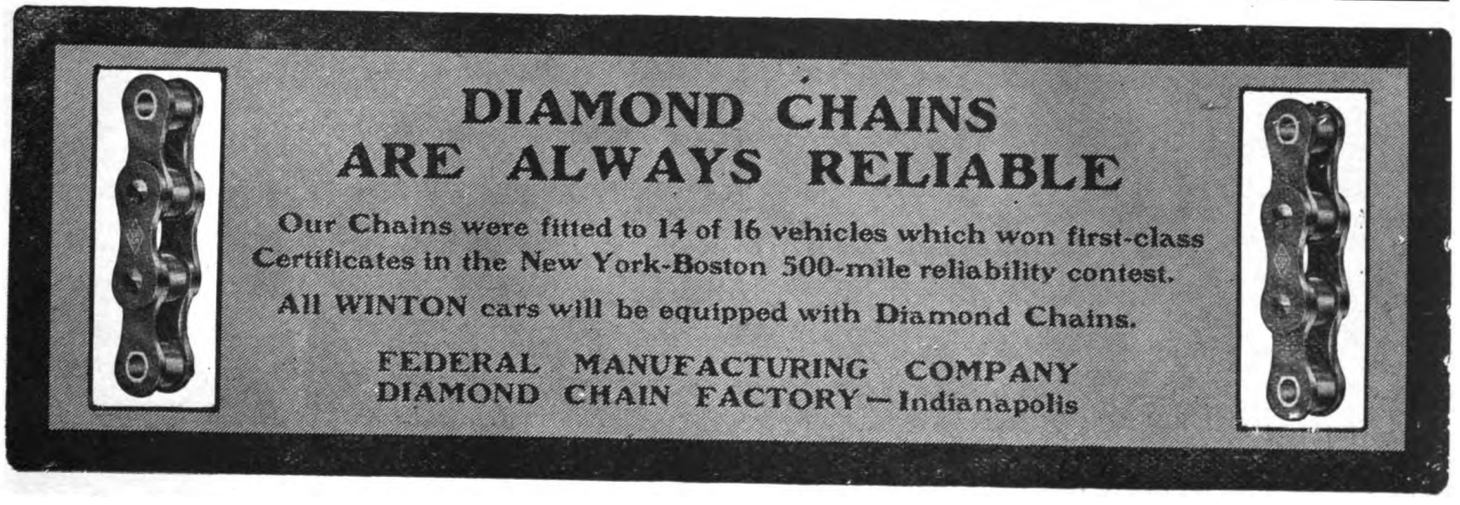
719,970. Vehicle Wheel. William R. Wood, St. Louis, Mo. Filed Dec. 5, 1902. Serial No. 133,984. (No model.)

Claim.—In a vehicle wheel, the combination of a hub and spokes, sleeves fitted to said hub, flanges carried by said sleeves, wings carried by said flanges to bear against the sides of said spokes, and reinforcing ribs arranged to strengthen said wings, substantially as set forth.

720,126. Speed Regulator for Explosive Engines. Lee A. Frayer, Columbus, Ohio, assignor to Columbus Machine Co., Columbus, Ohio. Filed Nov. 10, 1902. Serial No. 130,783. (No model.)

Claim.—1. In a gas and gasolene engine, the combination of a rotating side shaft, a governor actuated by said side shaft, a trip latch having a slotted end, a latch actuated by said governor and engaging and disengaging with said trip latch, a clutch cam consisting of a collar rigidly and a part loosely mounted on said side shaft, springs and oscillating dogs within said collar, a pawl carried by the loosely mounted part of the cam for operating said dogs by the action of the trip latch and a stop within the head of the cam for engaging the dogs and carrying the cam with the collar in its rotary motion.

720,253. Vehicle Wheel. Richard E. Jeffrey, Grass Valley, Cal. Filed Oct. 27, 1902. Serial No. 129,027. (No model.)



Claim.—1. The combination in a wheel hub, of opposing perforated plates between which the ends of the spokes are engaged, lateral projections at right angles to the plane of said plates, a hollow conical wedge passing through the perforations in said plates and bearing against the ends of the spokes, said wedge having peripheral corrugations in which said lateral projections may be engaged, and means upon the hub for compressing and locking the parts.

720,294. Carriage Body. Roy Stone, Washington, D. C. Filed May 28, 1901. Renewed July 17, 1902. Serial No. 115,950. (No model.)

Claim.— 1. The combination with a suitable supporting frame of substantially U shape, two supporting wheels and springs, of a vehicle body of substantially U shape and conforming with the frame and hung within the same, an interior concentric seat to the vehicle body and a low entrance platform at the forward open end, substantially as set forth.

720,821. Secondary Battery. Frank Buchanan, Dayton, Ohio. Filed March 18, 1901. Serial No. 51,763. (No model.)

Claim.—1. A secondary battery, the electrodes of which consist of three or more concentric tubular lead electrodes, the said

Digitized by Google

electrodes being separate and disconnected so that each containing electrode separates the solution from the next adjacent outer electrode, the outermost one of each tubular electrodes, forming the main containing cell and constituting an electrode of single polarity, and insulating means between said electrodes.

720,241. Motor Vehicle. Charles L. Haase, Jr., Milwaukee, Wis., assignor to Northwestern Furniture Company, Milwaukee, Wis., a copartnership composed of Charles L. Haase, Rudolph C. Haase and Rudolph C. Forrer. Filed Dec. 8, 1902. Serial No. 134,315. (No model.)

Claim.—1. In a motor vehicle, the combination with a pivotally supported speed changing device actuated by a slidable member, of a distance rod, a movable agent for sliding said slidable member in engagement therewith and freely movable thereof, and means for moving said agent.

720,336. Vaporizer for Gasolene Engines. George A. Ede, Cobden, Ill. Filed July 29, 1901. Serial No. 70,113. (No model.)

Claim.—1. In a vaporizer, the combination with a housing having a vaporizing chamber, one of the walls of the housing being removable, of a hollow perforated member carried by the removable well, and a feed pipe communicating with the interior of the member.

THE
PLEASURES OF AUTOMOBILING
WILL BE GREATLY ENHANCED BY THE USE OF

HARTFORD or DUNLOP
PNEUMATIC TIRES

The ORIGINAL and "MODEL" TYPES of SINGLE AND DOUBLE TUBE TIRE CONSTRUCTION

Appreciating the fact that requirements vary as to Single Tube and Detachable Tire Construction, we offer the most reliable of both types—*The Honest Standards.*

THEY WERE BEST YEARS AGO, AND YEARS OF INTELLIGENTLY PERSISTENT, CAREFULLY DIRECTED EFFORT HAS MADE THEM BETTER TO-DAY.

Where Quality is desired—where Comfort, Durability, and Protection against Annoyances is wanted—where All-'round Satisfaction is demanded—these tires should be adopted. Let us prove this to you by sending you signed statements from some of the most prominent makers and users in this country.

A High Appreciation of

GOODRICH CLINCHER AUTOMOBILE TIRES

THE ORIGINAL AMERICAN CLINCHER.

White Sewing Machine Co.
Automobile Department
Rose Building.

Cleveland, O. Dec. 24, 1902.

The B. F. Goodrich Co.,

Akron, Ohio.

Gentlemen:

We have been using the Goodrich Clincher Tire on our automobiles for the past two years, during which time we have found it thoroughly satisfactory both to our customers and ourselves. The facility with which repairs can be made at any time, as well as its most excellent riding qualities, make it the most practical tire on the market to-day.

Wishing you the usual compliments of the season, we are,

Yours very truly,

The Oldsmobile

ACTUAL proof of the reliability of the OLDSMOBILE is shown by three years use under all possible conditions.

Is not this more satisfactory evidence than the theoretical arguments of manufacturers who have yet to prove they can make a machine which will stand every day use?

PRICE, $650.00.

BOUGHT ONE OF THE FIRST OLDSMOBILES MADE.

OLDS MOTOR WORKS, Detroit, Mich.

Gentlemen:—Please quote me price on Dos-a-Dos seat for my Oldsmobile. I feel pleased to express satisfaction with my Olds carriage. As you probably remember, I bought the first Olds carriage sold in Detroit. I have just completed a short trip in Canada of about four hundred miles, this being the third trip of the kind in one year, and in that same time my repair bills have not amounted to $10.00, and my carriage is still in perfect running order.

Awaiting your reply in reference to seat, I am,

Respectfully yours, P. DILLON.

Volume V. New York, U. S. A., Thursday, February 26, 1903. No. 22

OWNERS ASSURE SUPPORT

Join With the A. C. A. and Make Commercial Contest Possible—Makers Oddly Placed.

A spendid response was made last week by business firms who own motor delivery vehicles to the invitation of the contest committee of the Automobile Club of America to meet with them and confer about a competitive event for commercial motor cars. Ten different firms sent representatives to the meeting held at the clubhouse in New York on last Thursday, and the sense of the meeting was that a contest such as had been outlined. Sufficient support was pledged to warrant the contest committee in going ahead with its plans.

Messrs. J. A. Hill, Emerson Brooks and Roland R. Conklin, of the committee, were present, and among the institutions represented were the United States Express Co., by L. P. Starkweather; Adams Express Co., by A. Hirschman; National Express Co., by J. S. Getty; American Express Co., by G. W. Singerland; Bloomingdale Bros., by W. G. Lipsey; Arnold Constable Co., by G. W. Wilson; Stern Bros., by J. E. Kent; Simpson Crawford Co., by W. Krummer; Niles-Bement-Pond Co., by H. M. Cleaver, and the West End Storage Co., by A. Blumenthal.

An interesting statement was made by the representative of the Arnold Constable Co., who said that his firm had run motor wagons a total of20,000 miles at a cost of six cents per mile. The average cost per day for each wagon had been 95 cents, not including the wage of the driver.

Some manufacturers were present at the meeting, but they kept very quiet. After the session was over a man was heard to remark: "I don't know whether the contest committee intended it or not, or whether it even appreciates the fact, but what it has done puts it up to the manufacturers in a peculiar way. If these business houses enter vehicles they are apt to have men on them who may be good for delivery work, but not the ones for a competitive test. Is a manufacturer going to stand by and see one of his vehicles get the worst of it in a contest because it is not in the hands of a thoroughly skilful man? I should think not. I'll bet you will yet see the manufacturers running to cover by volunteering to furnish operators for the vehicles, and I reckon they will enter cars themselves, too."

Now the matter rests until the governors of the club meet next week and receive the report of the contest committee.

Remington Reorganization Effected.

Success has crowned the efforts to reorganize the Remington Automobile & Motor Co., of Utica, N. Y. Incorporation papers have been prepared and will be forwarded to the Secretary of State. The capital stock has been placed at $100.000, of which one-half is preferred. The shares are $50 each. The corporators are Philo E. Remington, of Ilion, and O. S. Foster and W. H. Owen, of Utica. The following are the directors for the first year: J. B. Wild, O. S. Foster, W. H. Owen, L. M. Graham, A. E. Omens, Charles Xardell and A. J. Baechle. John B. Wild will be chosen president, and the management of the business will be under the direction of W. H. Owen. As soon as possible the plant will be opened and set in operation.

Obtained Judgment by Default.

Judgment by default was given at Providence, R. I., last week in the case of the Frazer Bros. Co. against the Eastern Automobile and Supply Co. The case is one in which the plaintiff claims damages of $1,000 from Chester I. Campbell and Edward R. Bancroft, copartners, doing business as the Eastern Automobile & Supply Co., to compensate them for the loss of a "Baldwin automobile runabout" with a red running gear, which they allege the defendants did "convert to their own use."

Rainier Moves Uptown.

The Rainier Co., selling agents for the Vehicle Equipment Co., the Berg Automobile Co. and the Neftel Automobile Co., has located its offices and salesrooms temporarily at the company's charging station, Twenty-seventh street and Ninth avenue, New York. The offices will be there, instead of at 393 Broadway, until he new Rainier Building, at Broadway and Fiftieth street, is completed.

TO SELL SPAULDING

Sale set for Saturday but Bankruptcy Proceedings may Head it off.

On Saturday of this week the effects of the Spaulding Automobile & Motor Co. will be sold at auction at Buffalo. The terms of sale are 25 per cent cash and the remainder on delivery of goods.

Nelson P. Baker, temporary receiver, announces that he will take this step in pursuance of an order of court granted on February 23. It authorizes him to "expose and sell in bulk at public auction to the highest bidder, for a sum not less than $2,500, at No. 63 Chandler street, in the city of Buffalo, N. Y., on February 28, 1903, at 10 o'clock in the forenoon, all the merchandise and raw materials, tools and shop equipment, patterns, machinery and office furniture, set forth in the inventory contained in Schedule A annexed to the petition upon which said order was granted, a copy of which inventory may be seen at the office of the receiver or his attorney, or on file in the office of the clerk of Erie County."

It is understood, however, that certain creditors are not pleased with the situation and believe that the failure should be probed. These are making an effort to have the concern thrown into bankruptcy.

Darracq's New Depot.

A new establishment is soon to be opened in the automobile row on West Thirty-eighth street, New York, between Broadway and Seventh avenue. This is in the two-story brick building at No. 147, between the store of the Banker Bros. and that of the Cadillac Co. The new place will be a show room and sales department for Darracq cars, under the immediate charge of Mr. Taylor, who is now associated with Frank La Roche, the American agent. The work of refitting the interior of the new place is now in progress.

Making One Hundred for Marr.

The Marr Automobile Co., Detroit, Mich., have one hundred cars under construction. The work is being done by the Fauber Mfg. Co., Elgin, Ill.

SEEKING JUSTICE IN JERSEY

Automobilists Find a Friend in Assemblyman Williams Whose Bill Lessens Scovel Strictures.

On Wednesday a hearing on the obnoxious Scovel bill was held before the Committee on Municipalities of the New Jersey Legislature, and it was then revealed that an entirely new phase has come upon the situation. Assemblyman Scovel is a member of the committee to which his bill was referred and he was steadfast in trying to urge through his measure. In this he was opposed by a delegation of automobilists, headed by Winthrop E. Scarritt, president of the New Jersey Automobile Club. The automobilists favored the passage of an entirely new bill, which was introduced into the legislature at their instigation by Assemblyman Edgar Williams, of Essex County, on Tuesday.

The reasons for this new situation are that, after the automobilists had objected to certain features in Mr. Scovel's bill and drafted amendments, Mr. Scovel looked them over and said that if he could take them and fix them up a little he would incorporate them. He "fixed them up" in a way that was decidedly objectionable to the automobilists, and when they tried to get him to modify his changes, he told them to get out and he would go ahead and push through his bill as he wanted it for all he was worth.

This was all explained to some of the members of the Automobile Club of America on Tuesday night before the hearing by W. E. Scarritt. The result was that a number of the members at once sent telegrams to Assemblyman Williams, indorsing his bill and encouraging him to stand by it.

The Williams bill, as explained by Mr. Scarritt, is not very favorable to automobilists, because it was deemed best not to arouse fresh antagonism, but to get rid of the "iniquitous" features of the Scovel bill "by working along the lines of least resistance." For this reason no changes were made in the speed limits fixed in the Scovel bill, the features most objected to being those which would enable any constable to arrest a man at any time, even a year after the offense, for a slight infraction of the law, take him before any justice and have that justice impose any fine or imprisonment he might please.

The objections made to the Scovel bill at Wednesday's hearing were urged by the counsel of the New Jersey Automobile Club. The sections most opposed are given below in quotations. The remarks following the sections are those of the counsel made in a draft of the bill previously prepared for the occasion. Both have been somewhat abridged.

The objection to the Scovel licensing section, which comes first, is that, as worded, it makes a man liable to arrest if he takes a vehicle home into the stable before he gets a license. The Williams bill reads that the owner shall file a declaration of competency and a written statement and that the certificate shall be issued for each motor vehicle instead of for each person.

"Section 5. . . . Such person may lawfully maintain, but shall not exceed a rate of speed of eight miles per hour where such street or highway passes through the built-up portion of a city, town, township, borough or village, and a speed of one mile in three minutes in the open country, meaning thereby portions of such communities, or otherwise, where the houses are more than one hundred feet apart, excepting in the open country upon sharp curves, and at cross roads, where the speed shall not exceed one mile in ten minutes."

The Williams bill contains a provision that the speed limit shall not apply to physicians and surgeons.

"Section 9. Any person driving a motor vehicle upon any public highway, or other public place in this State in a race or on a bet, or wager, at a speed exceeding that herein provided for, shall upon conviction be fined in a sum not exceeding $50, and in default of payment thereof be punished by imprisonment in the county jail for a period not exceeding twenty days."

The original bill as printed provided for a penalty of $25 for a general violation of this act, but the Scovill bill omits this section and leaves it quite free to the justice to impose any penalty he may see fit so far as this bill is concerned.

The difference between six miles an hour and six and a quarter miles an hour must be, in the absence of accurate mechanical speed indicators, a matter of opinion. The driver of the automobile must, in the majority of cases, guess at his speed. The officer who arrests him must also guess at his speed. The justice is the last guesser, is likely to guess with the officer, and the effect of this action is to leave no limitation by statute upon the power of the justice who enforces his guess by fine or even by imprisonment.

"Section 10. Upon oath or affirmation made according to law, that any person has violated any of the provisions of this act, any magistrate of the county where such offense is committed may issue process in the nature of a summons or warrant in his discretion, at the suit of any person. . . . If the magistrate before whom such trial is had, shall find the defendant guilty, he shall give judgment for the penalty mentioned in the section or provision herein violated. In default of the payment of the judgment and costs the defendant so convicted may be sentenced to the county jail for any period not exceeding thirty days."

There is no limitation on the time when the complaint may be made and filed. It is possible to wait two years and to charge a man with having run 6¼ miles an hour for 10 feet where he ought to have run 6 miles an hour for the same 10 feet, and have him arrested for it two years later when all knowledge of the transaction has passed out of his mind. The language of the act in reducing the limit of speed to almost an impossibility renders the penalty of infringing the law so imminent that it ought not to be within the power of a constable, or any other person, to guess that a man is going at the rate of one mile in 9½ minutes, while he is walking faster than the automobile, and have this automobile driver arrested.

Sections 12, 13, 14, 15, 16, 17, 18, 19 and 20 do not differ materially from the Williams bill.

Summing up, the objectors to the Scovell bill say:

"1. The principle of the Scovel bil is to fix arbitrary rates of speed. The Williams bill accepts these rates of speed.

"2. The theory running through the Scovel bill is that the automobilist who exceeds unintentionally and unknowingly these very low limits a criminal, to be arrested and put in jail.

"The Williams bill provides that for the first offense, unintentional infraction of the speed limit, the offender is to be summoned before the magistrate and to be given a hearing.

"3. The Scovel bill permits the automobilist to be arrested at any time after offense and complaint made by any one, and allows the arrest of the automobilist in any part of the State at any time upon such complaint.

"The Williams bill differs from this in this respect, that it does not permit a man to be arrested for the first offense, that it limits his fine to $25 for infraction of speed limits, under ordinary circumstances.

"4. The Scovel bill contains no limitation upon the punishment, whether by fine or imprisonment, upon the man who infringes the speed limit. It makes it a crime for the man to exceed the speed limit whether unknowingly, unintentionally or otherwise.

"There is a startling absence in the provision of the bill. It makes the infraction of the speed limit a crime, but does not limit or define the punishment of the crime, which remains in the discretion of the justice whether to fine, imprison or otherwise punish as he pleases."

The Law Favored by Connecticut Fire-Eaters.

Remarkable in its simplicity and directness is the infamous Warren bill introduced in the Connecticut legislature a short time ago. One can understand its author declaring, as he did, that the rifle could be used to advantage in dealing with autoists.

The measure in full is as follows:

"Section 1.—That no automobile, locomobile, electric carriage or horseless vehicle of any description shall be allowed to run over the country roads in this State at a rate of speed greater than eight miles an hour.

Section 2.—That any automobile, locomobile, electric carriage or any vehicle propelled by steam, gas or electricity, shall, upon approaching any vehicle drawn by one or more horses that show signs of fright, come to a full stop and so remain until such horse or horses shall have been brought under subjection or allowed to safely pass.

"Section 3.—Any person or persons violating either provision of this act shall be fined $300 and thirty days' imprisonment, or both. One-half of the fine to go to the person giving information leading to the arrest of the offender and one-half to the town where the arrest is made.

WITH OR WITHOUT BODIES

The "Chassis Only" Policy Arouses Discussion and an Interesting Diversity of Opinion.

"It will come to that, but the time is not yet."

This in brief is about what the trade opinion is concerning the selling of the chassis and body separately, or having the makers of the motors produce the chassis only and sell them to customers, leaving the latter to get any style of body fitted he may choose.

A partial canvass of the trade in New York City shows that while there is now quite a general opposition to the idea of the builders doing this, the majority of the agents think that the change is likely to come in another year or two and business be done here as it is in Europe. Of course the makers of runabouts are least bothered about different styles of bodies. They make one pattern and it is a case of "take it or leave it" for the customer. If he doesn't like the style of the body he will have to buy some other make of runabout with a different engine. This may seem hardly the thing to the customer, but at present he cannot help himself, for the maker will not make a special body for him. The dealers in runabouts say, however, that they are not yet troubled by any demands for bodies different from what they offer, the buyers seeming to be content to take what is offered.

With the buyers of tonneau cars, though, the story is different, and already there are evidences of a growing inclination on the part of customers to designate some special style of body. This condition is being met by the makers, a number being willing to build bodies of special design to order in their own shops, or when this is not satisfactory, to sell the chassis only. Most of the New York agents seen on this subject by a Motor World representative objected to being quoted, because they did not want to be put in the light of dictating to the factory, but several agreed with the sentiment expressed by one, who said:

"If the factory people could have my experience in selling complete cars they would not extend their body building connections. To make cheap and satisfactory bodies it is necessary, as in every other line of manufacture, to produce in quantity. One or two or three styles of bodies are not enough to please every one. If a customer wants something different from any of our models and orders one made, he is delayed in getting his car. It would be better to sell him the chassis and wash our hands of him by turning him over to a body building firm who turn out enough varieties to please every one. That would be the logical method, and that is what is bound to come."

Another dealer, one of a firm handling French cars, was much more outspoken, taking strong ground against the proposition.

"For heaven's sake, don't advocate such a thing as selling the chassis alone," he exclaimed. "We have trouble enough as it is, without adding to it. Why, a special body can't be built inside of three months. You can't hurry the painting without making a bad job of it, and in a little while it will look like slop work."

"But couldn't a certain number of bodies be kept in stock to select from?" he was asked.

"It would not do any good. Each purchaser would want something different from the stock patterns, and no body concern could do more than keep a few of the styles most likely to be used. These could hardly be sold, for then there would be no sample to show; and if they were kept on hand they would be of little value at the end of the season.

"It was only the other day that I sold a car to a customer. The body didn't quite suit him, and in preference to having a new one made for him I talked him into having some changes made in the body already on the chassis. Now, it will take six weeks to have those alterations made, and delivery will have to be deferred until then. Now, what kind of business is that? If we could have persuaded him to take the car as it stood the transaction could have been completed at once. Now we have to wait and maybe the body won't just suit when we go to deliver it, and that will mean more trouble.

"No, sir, we don't want any chassis business in ours. The worst thing that could happen to the trade, just now at least, would be the advocacy of such a policy."

Still "Expecting" Edison's Battery.

A Motor World man felt inquisitive about what the Edison battery might be accomplishing about this time. According to the statements made by the talk-charged representatives of the battery at the New-York show, the batteries should now have been in use by B. Altman & Co. for several weeks, for the statement was made at the show that this firm was to have several wagons equipped within a couple of weeks.

The Motor World man therefore sought the superintendent of the Altman store, and asked him if he had any wagons in service which were using the batteries. The answer was:

"No, not yet. We are expecting to get the batteries every day now. We have been expecting them for a year."

"But I thought you had a lot ordered and were assured of delivery about the last of January. That is what was said at the Edison stand at the show."

"No, we have no order placed. We are like every one else, simply looking for the thing that will do the trick. We have been promised some of the batteries to try, and we are waiting for them. We expect them day by day."

IMPROVED TOWARD THE END

But at That, Chicago's Show Fell Far Short of Anticipation—Some Opinions of it.

The Chicago show, which closed on Saturday night last, proved disappointing to the end. In point of attendance and sales the last half of the week was a distinct improvement on the earlier half, but the general satisfaction that marked the New York event was as markedly lacking.

The exhibitors who reported "good business" were the exception and not the rule, and while many were averse to having their opinions put into print, in private conversation they did not attempt to conceal their disappointment. Several went so far as to say they would never again exhibit at Chicago, while at least two seriously remarked their belief that one national show—that in New York—is sufficient for all purposes.

These are not pleasant truths, but, unpleasant though they be, it is only fair that they be recorded.

It is not designed to convey the impression that none were satisfied with their sales during the week, for there were those who "cleared expenses" and had small fault to find, while questioning was not necessary to disclose that the Olds Motor Works had done well. There were also a few, like the E. R. Thomas Motor Co., who were immensely pleased, their sales having exceeded even their orders booked at New York.

But against all these was the preponderance of opinion that the show, save as a spectacle, had fallen far short of expectations.

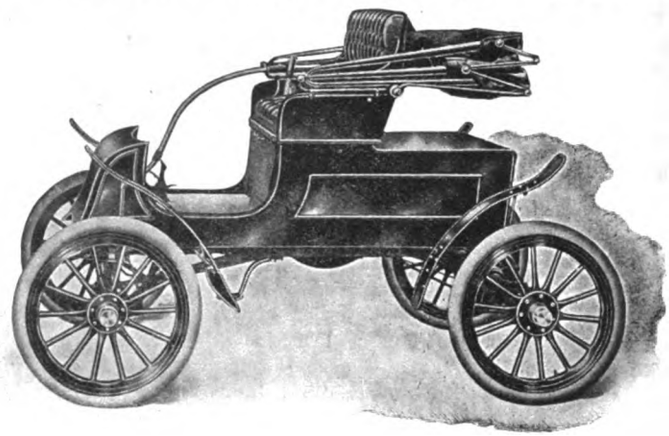
Course for Boston's Christians.

Boston's Young Men's Christian Association pays unusual attention to practical subjects. It has classes in mechanical drawing, etc., and makes a specialty of fitting its members for business life. Consideration is now being given to a course in automobile and gas engine construction, which is a possibility for next year.

All Ready in Philadelphia.

At the Philadelphia show, which opens on Saturday at Horticultural Hall, all the space devoted to complete vehicles has been taken. Under the arrangement of spaces, the cars and sundries are separated. The former occupy what is termed the upper hall, and the latter the lower hall.

Recent Incorporation.



Hartford, Conn.—The Hartford Motor Vehicle Co., with $50,000 capital; to manufacture and deal in motor vehicles of all descriptions. Corporators—Albion B. Wilson, Lucius F. Robinson and Frank A. Hagarty.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y, Post Office, November, 1900.

New York, February 26, 1903.

Anchors to Windward.

Some papers and people are prone to prate of the "automobile boom" and to bring to bear comparison with the "bicycle boom." Usually the talk is coupled with prediction or fear that the slump that followed the tidal wave of cycling interest will mark also the newer interest.

It is not to be denied that the trade lacks boomish symptoms and that men with idle factories and little capital or no capital at all are attempting to break into what appears a new Eldorado, and undoubtedly some of these will be "bitten" and cry out for pain and disappointment. But all other considerations aside, the automobile industry and the bicycle industry differ in this vital respect: Any one could make a bicycle that would run; not all who try can make a motor car "mote."

This is one safeguard. Another is the great number of bicycle manufacturers who are now successful and substantial manufacturers of automobiles. If lessons learned in the school of stern experience are of value these makers should be able to distinguish and to guard against either upward or downward tendencies of the boom, what ever size or shape it may assume.

One Test Badly Wanted.

Next to the development and furtherance of commercial vehicles, we fully agree with our coutemporary, the Horseless Age, that the automobile interests require nothing so much as a public cold weather test.

The impression that the motor car is essentially a fair weather vehicle is too general, and something is necessary to eradicate it and to prove the motor's utility and practicability in "rain or shine, hail or snow and every kind of weather."

It is now too late to promote an event of the sort, but the Automobile Club of America or some other body of influence should make note of the fact and not permit another winter to pass without public demonstration of the sort. Private performance, however meritorious, is of little, if any, effect.

The "Embattled Farmer."

Of late years the ruralist has been undergoing a belated and very necessary rehabilitation. His fondness for blocking the wheels of progress appeared to have abated, and he seemed to awaken to a realization of the fact that the role of chronic kicker did not pay. His distrust of everything associated with the "city man"—unless he carried the implements for playing a shell game—relaxed a bit. He even began to admit, grudgingly, to be sure, that good roads benefited him quite as much as they did the urban resident.

But the inborn tendency to obstruct dies hard. The automobile—that transportation agent that is destined to still further revolutionize the life of the country resident and to carry on the work the bicycle and the trolley car has begun—is looked upon as his natural enemy. The loneliness of the farmer's life, and the life of his wife, son and daughter; the remoteness from the centres of thought and intelligence and life—this has been the chief factor in emptying the countryside and sending its onetime inhabitants to the congested cities. The annihilation of distance will start the tide in the opposite direction. The urbanites, or many of them, sigh for suburban delights, and it only needs to place the country within reasonable distance, measured by time, to secure them as residents.

Here lies the farmer's opportunity. The automobile makes it possible for him to get to the city whenever he wishes, and brings the denizen of the city to the country. Its multiplication is of vital interest to the farmer. Instead of opposing, he should encourage it. By its use the suburban limits will undergo a great extension, the land of the farmer will advance in value, his comfort and pleasure will be promoted. Every consideration urges him to welcome it, to encourage its use.

But we are to-day confronted with the sight of the "embattled farmer" erecting himself in opposition to the motor vehicle. To him it is like a red flag to a bull. Like the Irishman, for him to see an autoist's head is to hit it. If the automobile becomes a common sight in remote rural districts it will be in spite of rather than by grace of him.

The present flood of anti-automobile legislation is largely the work of the rural legislator. He is "agin" automobiles. They must accommodate their speed to that of his slow-going nag, taken from the plough to draw the buggy. If the horse or its driver should show fright it is the automobile that is to blame. Best of all it would be to keep it off the road altogether; but, failing that, the proper thing to do is to load it down with restrictions that will prevent its increase and multiplication.

Of course, the time will come when the egregious folly of all this is perceived. The farmer will finally have it borne in on him that the automobile is his friend, quite as much as that of the city man. And the motor vehicle will fulfil its destiny in spite of this and other forms of opposition. But it does seem a shame that it should meet with such treatment, and be hampered and bullied and baited as if it were the enemy of mankind, instead of its best friend.

Why no Installments.

For the present the automobile business is, and probably will be for some time to come, a clean one. Installment sales are unknown. The purchaser of an automobile must pay cash, or its equivalent, before he can indulge in what in some quarters is termed a rich man's pastime. The insidious practice is certain to be followed some time, of course; but in these halycon days no would-be autoist is daring enough to ask for, and no dealer foolish enough to grant, easy terms for artlcles as readily saleable as automobiles. In a sense, the autoist must live up to his repu-

Digitized by Google

tation if he hasn't money he parted with it for his automobile.

In all seriousness, however, the evil day of instalments is one that should be put off as long as possible. In itself the practice is not necessarily harmful; good men—desirable autoists—may have recourse to it and no stigma attach to them. Sales can be greatly expanded by the simple expedient of retailing at so much down and a specified sum per month. Thousands of people will thereby have the horseless vehicle placed within their reach who otherwise would be utterly unable to acquire them. And, as stated, the time will surely come when the bars will be let down and the short pursed public permitted to swarm in.

But all this is a matter for the future. It can safely be left to take care of itself. Certainly there is nothing to gain by hastening the matter. With factories taxed to their utmost capacities and an abundance of buyers on the regulation terms, there is every reason why the old order should not be changed.

Where More Light is Needed.

Travelling through the different localities occupied by the big automobile agencies and garages, there is to be noticed a striking lack of enterprise, or misguided economy, in the absence of electric lighting and general display.

There is no business that is above this sort of thing. Brilliant lights in front and within and artistic window dressing are considered indispensable by the greatest merchants. Automobile stores have not much scope for window display, but the windows can be so draped or set off with palms that they will not present a barbaric bareness that jars the eyesight, as some windows do now. The window trappings are, however, secondary.

First of all is the matter of electric lights outside. They are expensive, yes; but not so costly as the passing by of thousands and tens of thousands without knowing what sort of a place they are passing. Men and women cannot get past the brightly illuminated places on the thoroughfares without taking note of them, and just at present in the development of the automobile business is the time when every establishment of the sort should somehow be made to "stick out" so as to obtrude itself upon the notice of the casual wayfarer. No matter whether the place is one that is kept open nights or not, there are persons happening along in cities at all sorts of odd times, and every now and then there will be one to exclaim, "Hello! I didn't know that place was there before. I'm glad to discover it."

If the place is on a side street near a busy avenue, as most places in big cities are, there is all the more reason for lighting up and catching the eyes of the throngs on the thoroughfare. The word "automobiles" and the name of the owner or manager or make of car should always be coupled in the display. At the very least the interior of the stores should have electric lights and not left looking like country shops at night.

It is useless to try to be superior to the need and use of such display. A bright light attracts men and women as surely as it does moths, unless the men and women are blind, and there are not many automobiles being sold to the blind nowadays. It is not to be considered as "cheap" to make a display. A "fine front" is not necessarily a "bluff," but it necessarily does command attention. Automobile agents are as yet cultivators in a new field, and they want to attract attention. They should not hide their light under a bushel or anything else, but should let it so shine in front of their establishments that the unconverted may behold it. The good done by store illumination will be a direct one to the storekeeper, and an indirect one to the industry at large, by impressing the public with the number of automobile establishments and their evident prosperity. The effect of such an impression is a subtle one. It sends home a person with the conviction, gained unconsciously, that "the automobile is the thing."

As the great Goethe said, "More light." If we have it we will have more buyers.

Steam's Increased Radius.

Only a very short time ago the user of a steam car had it impressed upon him that he must oil early and often. Every fifteen or twenty miles at the most he must stop, get out his oil can and lubricate his engine. Neglect of this simple precaution might mean ruin, it certainly meant trouble and a repair bill.

At the same time, and considerably later, too, he was confronted with the necessity for making frequent stops for water.

A gallon of the precious fluid for every mile travelled. Such was the formula, and it still holds good. Tanks holding more than twenty or twenty-five gallons were rare, consequently the user of a steam car knew that he was due to hunt for a water trough every twenty or twenty-five miles—perhaps oftener. If he could not find a trough he could carry the water from a stream or hydrant in a pail, for get the water from somewhere he must.

A great change has come about since then. Automatic oiling devices have abated the lubricating nuisance, and condensers have performed a similar service for the water tank one. It is not uncommon to find steam cars with a guaranteed radius of fifty to one hundred miles. In this respect gasolene cars are emulated and frequently equalled. A load has been lifted from the mind of the steam user in consequence, and he is able to take long jaunts with infrequent stops.

To "turn on the light," in electrical matters is to prevent a host of troubles. A naked wire never conceals a breakage, as does one insulated in the usual manner. In the same way, a wire fastened to a terminal by means of the regulation thumb screw may very easily give imperfect contact and yet conceal the fact. Present practice is all in the direction of looking after such matters, and we shall be surprised if there is not a marked improvement noticed this season.

When the automobile no longer attracts attention—when the pedestrian ceases to stop and watch it pass—it may be said to have become a part of the busy city life, almost indistinguishable from trolley cars, elevated railroads, etc. Such time has almost come for the greater number of motor vehicles. It is only the big touring cars, with befurred chauffeurs and passengers, that claim notice now.

There is one type of horse drawn vehicle that has not yet been pressed into service as an automobile, and it is not due to its having been overlooked by designers of the latter, either. The dog cart and similar two-wheeled carriages have been left severely alone.

From effete Boston comes the fantastic term, "Aumobs." This is enough to fill even the best behaved horseless vehicle with a desire to rise up and protest.

If silence is golden, as we are told, then many "gasoleners" are still a long way off from that delectable condition.

The season's crop of "freaks" is much smaller than of old. Clearly the day of uniformity is getting close at hand.

Commentary

I clip what follows from the columns of a daily which proudly boasts that if you read a thing there 'it it so": Thomas A. Edison, in a stain-spotted suit and an old slouch hat drawn well down on his forehead, straigthened himself up from a dilapidated little table over which he had been bending, threw a stub of a pencil down on a yellow pad of paper, and settled back in an arm chair. 'At last,' he said, 'I've finished work on my storage battery, and now I'm going to take a rest." He gazed thoughtfully out of a window of his laboratory office for a moment. 'For I'm tired—very tired,' he added simply. 'I'm all worn out.'"

While not by any means believing all the foregoing, excepting the very appropriate color scheme of the pad of paper Mr. Edison is credited with using, I can assure Mr. Edison that he and the public are certainly as one in regards to this battery yarn —both are "tired—very tired."

* * *

The problem of how to make an automobile progress at the rate of a mile a minute is very much less difficult of solution than is the question of how to stop it at the same speed is. Inventors and space annihilators please note.

* * *

That particular brand of idot which devotes itself to the creation of the alleged comic valentine for his friends and relatives to purchase and send through the mails in the perpetration of what they undoubtedly imagine is something exceedingly witty, could not have been expected to have let the motor vehicle pass unnoticed. For once the expected happened, and the automobile was duly comicalized and valentined. The result was naturally something any admirer of wit or wisdom might indeed be proud of. One of these valentines which reached me had something on it which was between a scrambled egg and a nine of spades, but which the artist probably meant to be an automobile. Under this was these touching lines of "poetry":

Water, oh! Water, oh!
Every mile or so
You auto give your auto water
Water, water, oh!

* * *

I am an admirer of the Automobile Club of America, please don't forget that. But because of this admiration of mine I am not blinded to the faults of this very progressive organization. Even the sun, bright as it is, could not be a citizen of Spotlesstown, as you well know. To remove these spots nothing it likely to be successful as the sapolio of criticism, hence mine in the present case. The club recently issued a call for its opening run on Washington's Birthday to Lakewood. After this announcement had been duly heralded, another bulletin was issued saying that on account of the muddy roads, which were the exception between here and Lakewood, the run to that aristocratic resort would not be undertaken, but one to Philadelphia would be attempted in its stead. Now, it was all right enough to call off a run the route of which contained to many miles of unsatisfactory roads, but was not the choice of such a course a reflection upon the automobile club in the first instance? Then when it was decided to substitute another course, would it not have been quite as well to have avoided calling attention to the reason for the change being made? Do you think the public is likely to form a high opinion of either the automobile or the automobile club when neither of them is deemed capable of travelling on, over or through a muddy road? It is just as well not to be too frank in some things, things like these particularly.

* * *

In these days of clutches, carberetters, gears, spark plugs, differentials and what not, it is indeed a wise father who knows as much as his own son.

* * *

Men have been seeking to solve the problem of perpetual motion for hundreds of years, and tens of thousands of the wisest of them have died with the problem still unsolved. But the coming of the automobile meant the passing of the perpetual motion problem, though so modest was the man who made the discovery that he was content to proclaim it in the following little advertisement tucked away in an obscure corner of a daily paper:

"Gall's touring car; the only automobile made that runs as if on wings; positively no vibration or friction. New York agents, Barkin's Auto Station, East —th street."

Of course, anything which ran as if on wings would be something out of the ordinary, but when you combine the act of running, that is to say, motion, with "positively no vibration or friction," you have there and then the impossible—perpetual motion. I have not had a chance yet so see Gall's touring car, but if the New York agent of it is not Barkin up the wrong tree I am sure he has a mighty good thing in this Gall vehicle, provided he has not claimed too much for it in his advertisement.

* * *

There are always two ways to remedy a defect in the design or construction of a motor, and it's a short cut to the wrong way.

* * *

So, Columbia University has added automobile engineering to its curriculum, eh? Well, there's more trouble ahead for us all. In the near future each year will see a host of B. M.'s—Bachelors of Motorology—turned out by Columbia and the other universities which will quickly follow the lead of the Morningside Heights institution in this matter. The blue print army will thus be insured a never failing source of recruiting, and the automobile trade will have to pay for it all. Since the dawn of the motor vehicle era five years ago, it has been estimated that the college graduate with his blue-print drawings of an automobile has cost the confiding motor and purchaser of that particular class of green goods which are made for promoters to sell and folks to buy more than $13,000,000, without the demand for this kind of goods having been exhausted. With the coming of the B. M. we may reasonably expect that the supply of blue-prints will be increased sufficiently to permit of the hard working promoters seing to it that the would be purchasers of stock in concerns which announce they are going to build the most wonderful and most scientific automobile in the world will be duly accommodated.

* * *

The tourist who sees things as they ought to be is certainly a great deal happier than he who sees them as they are, but improved roads or improved anything else would alike be impossibilities if the world was made up entirely of those in whom imagination takes the place of observation.

* * *

Shoemakers' children go barefoot. Likewise the head of the Standard Oil Company cannot bear the sight, much less the smell of a vehicle which uses any of the Standard company's products for its propulsion. Queer, isn't it? Upon every available spot in the great estate of John D. Rockefeller, amid the Pocantico Hills above Tarrytown, are large signs which bear this notice: "No motor cars allowed." Some way it seems to me that if I was the largest owner of the Standard Oil Company's securities, I'd at least be passively in favor of the use of oil as a power producer, since nothing will eventually tend so much to make this giant of the monopolies the greatest money maker of them all as will the perfecting of the explosive engine and the use of oil as fuel for steam generating. If anything can hasten the coming of this it is the automobile, which has in the last five years done more in this direction than was done in the fifty years which preceded the vogue of the mechanical carriage.

* * *

When it comes to resenting the uncomplimentary remarks of corner loafers and burly teamsters, silent contempt is responsible for many an automobilist's unblacked eye.

* * *

Over in Switzerland people go about with what they call "curse cards" in their pockets, and whenever they hear an oath they present one of these cards to the swearer and ask him to sign it. Upon the card is printed a pledge to keep from swearing for a specified time, or to pay a small fine to some charity. Nearly 40,000 of these cards have been distributed recently. It should be observed that the Swiss have only lately taken to automobiling, and they have three languages to swear in.

FAVORABLE TO IRELAND

Bill in Parliment to Permit Cup Race Well Advanced and Probably Will Pass.

After a sudden and unexpected hitch on Tuesday, the passage by Parliament of the bill authorizing the running of the Bennett Cup race in Ireland seems certain.

The bill was introduced in Parliament by John Scott Montagu, and passed its first reading on Saturday. On Tuesday it came up for second reading, and consternation was caused by an objection made by W. J. Galloway, M. P., from South Manchester, no reason being given. On Wednesday, however, he withdrew the objection, which he stated was based on technical grounds. The bill will come up again to-day, and as absolutely no opposition is now in sight, there is every prospect that it will pass the Commons this week and the House of Lords next week.

It is quite probable that in connection with the International Cup there will be a hill climbing contest. A suitable course has been found in County Kerry, on the road from Killorglin to the top of a hill outside Tralee.

The Lord Lieutenant of Ireland is also to be asked to authorize the holding of a race to establish the kilometre record in Phœnix Park, Dublin.

Harkness and his Cup Car.

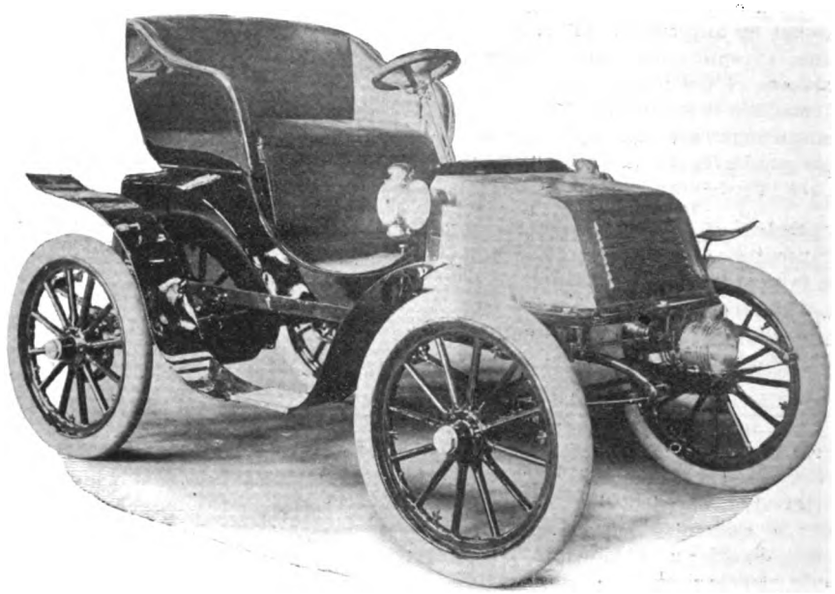
It has been positively ascertained that the cup race cars being built by H. S. Harkness is being put together at a certain establishment in West Thirty-eighth street, New York. With regard to the car, Mr. Harkness told a Motor World man on Tuesday that it will surely be completed by March 15. Then the following conversation ensued, beginning with a question by Mr. Harkness:

"What do you hear about the plans for the elimination contest?"

"Nothing. That is what every one would like to learn something about."

"Well, if they have any contest on a track I wont go in it. My car is not built for track racing. It is built for the road, and it would not go within 23 or 25 seconds as fast on a track as on a straightaway course. If they hold that road race on Long Island I will not able to run the car on the high speed—not on Long Island roads, but I can do it on the French roads."

"What do you think of the suggestion that the committee order all the candidates to go to France and have the elimination contest over there?"



All I can say is that I am willing. I am ready for anything except a track race as a trial for a road race. That would be absurd."

Owned by Five Millionaires.

Five of the leading millionaires of America in the automobile world to-day are said to own one-quarter of a million dollars' worth of automobiles, with a total of fifty machines in the five stables. John Jacob Astor owns fifteen, of which his $17,000 Mors machine, lately purchased for April delivery, will be the most expensive. Charles Schwab has three in America, and will return with three more of the most expensive sort. Jefferson Seligman is reported to have twelve, George Gould about the same number, while W. K. Vanderbilt has five, the latter undoubtedly being the most expensive stable.

The Newest National.

That the new electric two passenger touring car first shown at the Chicago show by the National Motor Vehicle Company, Indianapolis, deserved the attention it attracted and the praise it evoked, the accompanying illustration will serve to show, an interest that was, and will be, heightened by the moderate price—$1,000.

THE NATIONAL'S NEW $1000 ELECTRIC.

As will be seen, it follows closely the lines of the gasolene cars, having a bonnetted front and being a wheel steerer. It has four speeds both ways; front lever brake on rear wheels; springs half front, full rear; artillery wheels, 32x3½; foot plunger cutout; control handle left seat, with button for reverse; the motor and differential are inclosed within one dust and waterproof case, which forms part of the rear axle housing. The batteries are divided—sixteen front, twenty rear.

Maxwell Succeeds Tivy.

The L. Maxwell Mfg. Co. has been formed at Williamsport, Pa., to undertake the manufacture of automobiles, carriages and bicycles. It succeeds the Tivy Cycle Co. Work will begin at once.

PROHIBITS NICE RACES

French Government Decides That They are not of General Interest and Upsets Plans.

Road racing in France has been dealt a severe blow by the interdiction of the Nice races. Last year the race was prohibited by the Italian Government when all the cars were ready to start; and now the French Minister of the Interior has formally declared that the Automobile Club of Nice will not be allowed to run off its projected race from Nice to Salon and back.

The interdiction is all the more singular as the club had decided to make it an alcohol event, so that apparently a propaganda in favor of the new fuel cannot always depend upon the support of the government.

In his letter to the Prefect the Minister of the Interior states that he cannot give permission unless the races have a "general interest," and he also applies another reservation in terms so ambiguous that they may mean anything. To give them the most liberal rendering, it would appear that the government is only disposed to sanction races which have come to be regarded as annual events, and only when they offer an interest for the development of automobilism generally. Of course, this does not commit the government to anything, as its ideas of what is necessary for the interest of the industry may not be the same as those of the makers themselves; and it is to be feared that very few races will be authorized in France during the present year.

The first week in April will be observed as "show week" by Indianapolis, Ind., dealers. Four of them—H. T. Hearsey Co., C. G. Fisher Automobile Co., Conrad Mueller and S. W. Elston—will keep open house. Special efforts will be made to draw the public to the stores, where the latest models will be displayed.

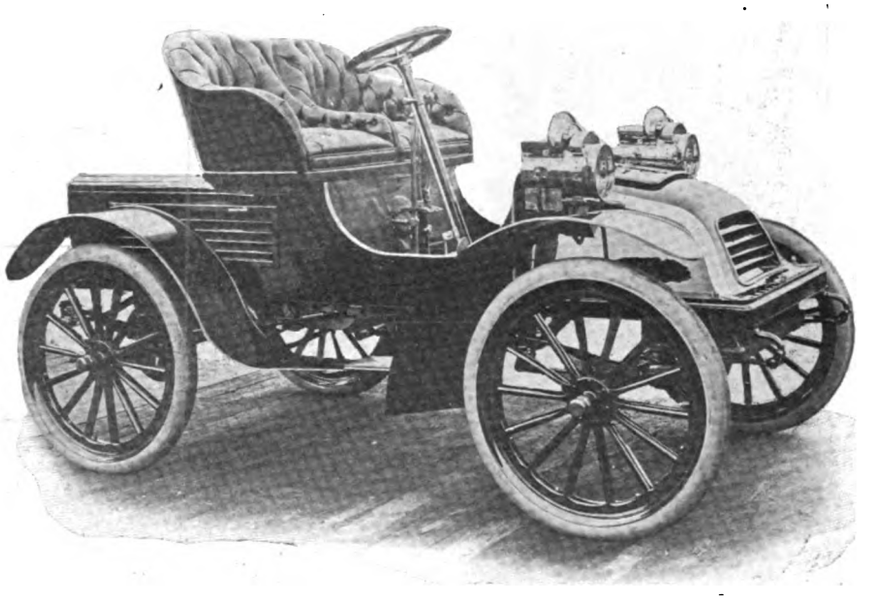
FAVORS MECHANICAL INLETS

Longridge Does so Unreservedly and Criticises Cylinder Modifications Adopted by Some.

"The extended use of mechanical inlet valves in the motors of 1903 has received frequent notice in the press. But there has been a somewhat obvious tendency to abstain from criticism, to withhold judgment, and await the results of experience. I see no reason for this policy of reserve. Mechanically operated valves were bound to come, and it is equally certain that they have come to stay," says Captain Longridge in The Autocar.

"There can be no doubt of the superiority of the mechanical over the automatic valve, and this is the reason for its advent and for its stay. But in the matter of present designs and existing applications, as portrayed in the recent shows, there is scope for both criticism and doubt as to permanence. To introduce the mechanical valve is a step forward, but to accompany it with such modifications of cylinder design as are distinctly opposed to good practice is a pace to the rear. It is to mix evil with good and to counterbalance the advantage of prompt and certain valve action by a disadvantage affecting the power of the motor. It is in this respect that the motors of 1903 appear open to criticism.



"With rare exceptions—notably, the Maudslay and the Mercedes 1903 type—all this year's engines fitted with mechanical valves have adopted this improvement at the expense of increased irregularity in the shape of the combustion chamber and of enlarged area of cooling surface. For these results attend the introduction, seen in most cases, of valve boxes and ports on both sides of the cylinder head. This modification of design is, no doubt, due to a desire to keep down the height of the motor, and by introducing symmetry to build a pretty engine.

"The result cannot but be prejudicial to combustion and the operation of the motor. A leading rule in gas engine design is to reduce to a minimum the area of cooling surface in contact with the hot gases. For this reason the combustion chamber should have a minimum surface for its volume, and as regular a form as possible. This is no purely theoretical rule, nor is it limited to gas engines. It applies to all internal combustion engines, and its influence or efficiency is abundantly proved by experience. The observation of this principle is perhaps of special importance in the case of gasolene motors. Gasolene mixtures are slow burning, and the cooling effect of increased wall area must tend to produce slower flame propagation and lower temperature, and, therefore, loss of power. A few makers, such as the designers of the new Mercedes, have evidently appreciated the influence of the explosion chamber on combustion, and have recognized that for this and perhaps other reasons valves are best placed directly in the head of the cylinder.

"Whatever may be the experience of others, I believe that these makers will have no cause to find mechanical valves anything but distinct improvements on automatic action. In connection with valves, another improvement is noticeable in some motors—that is, a combination in which both the valve and its seat are detachable from the cylinder, thereby giving greater facilities for grinding-in operations."

The $1000 Beauty From Belvidere.

When it was first announced that a concern of the resources of the National Sewing Machine Co., of Belvidere, Ill., was about to embark in the automobile business, it was taken for granted that the product would be of a kind to bear watching. The car has been a long time in coming, but it is here at last, and, as the accompanying illustration attests, it is an inviting creation. It will be styled the Eldredge.

ELDREDGE FOUR-CYLINDER, 20 H. P. GASOLENE CAR.

As will be seen, it is a two passenger vehicle and contains a four cylinder engine, stroke and bore of which is 3¾ by 4 inches, developing 12 horsepower at 800 revolutions per minute, and 20 horsepower, at 1,800 revolutions per minute. From this it can be seen that the motor is an unusually powerful one for this type of car. The transmission is of the slide gear type, driving direct on the high speed. The usual three speeds forward and the reverse is obtained, but the car is intended to be driven on the high speed most of the time, governing by throttle. The car is wheel steering, weighs 1,500 pounds, has a wheel base of about seventy inches and will list at $1,000.

Everything, with the exception of tires and ignition, is made by the company at their enormous plant. They do not expect to turn out many this year; but, if the sale of the car comes up to their expectations, they are likely to be an important factor in the trade next year.

HALSEY'S NEVER-DIE BATTERY

New Jersey Lawyer Enters the List With Edison and Explains his Wonder-Worker.

Another epoch marking battery has seen the light. It is the invention of a Newark, N. J., man, Halsey by name, who has been at work on it for four years.

"Stripped of technicalities, the lawyer's battery is nothing more than an ordinary battery, in which the carbon disk is made to revolve in the sulphuric acid and water," it is stated. "The zinc plates are, as in the common batteries, stationary. From the disk the element of power is taken by brushes against which it revolves. These connect with posts through which wires are passed leading to the motor."

Contradictory as it may appear, the motor run by the battery in turn revolves the disks by which the sustained power is furnished. This was explained by Mr. Halsey:

"There is as much power in all primary batteries as in mine," he said. "The only difference is it does not last. The ordinary battery will make an electric light, it will run a motor, but for a few minutes only. It is this short lived power that I use. In each cell the carbon disks are cogged, and they fit into cogwheels at the top of the cell. In a chain of cells the cogwheels are joined by a rod. When the current is first turned on there is power enough to turn the wheels of the motor for several seconds. This, of course, turns the cogwheels, which produces the sustained power. The force of the battery therefore never dies out.

"The whole idea is simply explained thus: The primary battery which operates a doorbell lasts, say, for six months. I simply cut its life down to six or seven hours by the revolving brushes, gaining, therefore, so much more power."

MAN AND MACHINE

Intelligence From one Necessary if Efficiency is Expected From the Other.

Much is expected of a machine. It is a thing of iron or steel, free from the weaknesses that flesh is heir to, tireless, proof against accidents, able to go on forever and anon. A little oil, a little attention, a little intelligence—these given, it will rise superior to failure.

But even the unmechanical mind grasps the fact that these little things are necessary if the machine be expected to properly perform its duties. The ill kept tool is a byword and a hissing in the mouth of expert and layman alike. As a laborer is worthy of his hire, so a piece of machinery is entitled to as much attention as will keep it fit for the work it is called upon to do. Then, and then only, can there be any assurance that the work will be done, and well done.

If the horse drawn vehicle is turned to, an equal—nay, a greater—solicitude is expressed, and the limitations of the equine are given most careful consideration. He must be well fed and watered, protected from the heat and cold, spared fatigue at whatever cost. He is driven carefully and never too far. If it is desired to make a long journey the horse is crossed from the eligible list. Some other mode of travel is adopted, and this without a thought derogatory to the four-footed beast. He simply is not in the long distance class; and if constant and extended use must be made of some horse, more than one is maintained, or hired in emergency cases.

When it comes to the automobile, however, the matter is viewed in an entirely different light.

With it the endurance and reliability of the machine is required quite as a matter of course, just as the limitations of the horse are left out of the case, naturally and without hesitation. And this is looked for without a return in the shape of the intelligent care that a machine must and does get.

The manufacturer who sends out a piece of machinery for installation in a factory knows that it goes into good hands—those of men experienced and in the custom of operating the most complicated, as well as delicate tools. They are men who have spent years at this sort of work, beginning with an apprenticeship when mere boys, and gradually working up until they are accounted fit to be entrusted with the most difficult classes of work. These men, if any, would know how to install a new tool and operate it to advantage, without any further assistance than is furnished by the printed descriptions and instructions always furnished with machinery.

But no maker stops at this if the machine is anything out of the ordinary. He sends a man with it to see that it is set up right and to "break in" the man who is to operate it. Not until the latter is deemed proficient is he trusted to do the work alone, and only then does his preceptor depart, to repeat the work at some other factory.

With the automobile there exists some reluctance to classing it as a machine. Instead, it is viewed in much the same light as a horse. A person of ordinary intelligence can drive a nag of well regulated habits after a few lessons, and he runs no great danger of getting into trouble during his novitiate if he keeps his wits about him. Ergo, he should be able to do the same with an automobile, the motor vehicle being the counterpart of the horse drawn one, and its natural rival.

The fact is frequently lost sight of that the automobile is much more than this. It is a machine, and although apparently a very complicated one, its principles at least are very simple and easy to understand.

"IN THE GRAY SHADOWS OF THE EVENING."

Digitized by Google

Being a machine, it must be treated with some intelligence. It gives the best results when it is tuned up to concert pitch, i. e., when it is in perfect order. Any falling off from this ideal state is visited by a loss in efficiency—the greater the fall the more pronounced the loss.

Some users understand this and govern themselves accordingly. Mindful of the old adage, they take the stitch in time—lubricate when necessary, see that all nuts, bolts and connections are tight, all adjustments made, deleterious substances of every kind removed from the working parts. If something goes wrong in spite of these precautions—and they may properly be regarded in the same light as accident insurance—they are able to bring sharpened wits to the task of diagnosing the case, and nine times out of ten cope with it successfully.

Intuition is a quality that is capable of cultivation. The autoist learns to sharpen his by taking note of past happenings, of making a mental memorandum of each mishap, of pondering on its cause and remedy, of keeping on the alert for their recurrence. He soon makes the discovery that the motor never stops without a cause; and, furthermore, that such stop, or even a loss of efficiency, is never unheralded. The false chord can always be detected by the ear attuned, the premonition of trouble had by the mentally alert. A slipping clutch, a non-exploding cylinder, a clogged pipe—these and a hundred other occurrences that are Sanscrit to the uninitiated are deciphered without trouble by the autoist who knows his book.

At the present time the automobile world is on the threshold of a new era. The old stage of experimentation is past, the last pages have been written, the volume closed and laid away. The motor vehicle is no longer a toy, a vehicle for enthusiastic sportsmen to take up, play with and ultimately drop. The sport no less than the pastime will continue to flourish, and must always have a place. But the use of the automobile as a transportation vehicle, a means of annihilating distance, is about to undergo an immense extension, to pass into the hands of thousands of men who hitherto have regarded it with indifference or curiosity or even hostility. This is to come about by reason of the ever growing belief in the possibilities of the new vehicle, and the knowledge that it is really "making good." The world has outgrown the old methods of horse transportation, and is ready to admit the fact. Coincident with this admission—brought about in part by it, as a matter of fact—is the knowledge that the something better, so long looked for and ardently desired, is here and ready for utilization. Put flint and steel and tinder together and a blaze will result. The juxtaposition of a freely acknowledged want and an ideal means of filling it renders the result a foregone conclusion.

In view of this boundless extension of the motor vehicle's use, this approaching worldwide use of the once derided, cumbersome, complicated, unreliable self-propelled car, the method of its future treatment should receive some of the attention that it merits.

The pleasant fiction that the automobile is a carriage and not a machine has served its purpose. Some pills require sugar coating, but it is because they are abominably tasted, and might not be taken at all if they were not first sugared. Time was when the automobile needed the pleasant accompaniment of the product of the cane; when the mere thought of the experience in store for the autoist would have occasioned as violent a retching as might have followed the taking of a pill sans sugar. But such time is no more. The automobile pellet needs no disguise, requires to sail under no false colors. As it is now it is its own recommendation, and none other is needed.

By all means, therefore, let the automobile go forth as a machine. The autoist who expects any motor vehicle except an electric to run in season and out on the push button theory, and is unwilling to learn its mechanism, should either engage a chauffeur-mecanicien or abstain from the more than doubtful pleasure of owning and operating one. He would come to his senses sooner or later anyway, so let him go, and peace be with him.

In his place there will be found the user who wants the best and simplest mechanism that mortal skill can produce. And having got it he will use the sense that God gave him to treat it intelligently, in order that he may reap the fullest possible benefit from it.

As a Battering Ram.

Ye tournament at joust was revived in a most modern and up-to-date fashion on Fifth avenue, New York, recently, and manufacturers will please take notice of what may be required of their cars and build accordingly.

In the gray of the early evening the jehu of a horse cab and the chaffeur of an electric cab approached each other, head on, at Forty-seventh street. Neither he who guided the horse nor he who held the steering lever was willing to give way and turn aside to let the other pass. The electric cab was empty, while the cab behind the horse contained a passenger, in the person of a prominent lawyer. These conditions made no difference whatever to the men in charge of the vehicles. Each continued on his course as if they were under the impulse of a hereditary hatred and the cabs came together with a crash. The two cabbies then jumped down and went for one another in true prize ring style. After one round at fistcuffs there was another one at ramming. The automobile operator sprang back to his cab and drove it into the cab with such force that it and another cab behind it were both forced up on the sidewalk. Then the electric was backed a bit and sent forward for another charge, ramming in on the horse drawn cab like a torpedo boat destroyer. This time the cab, horse and all, was jumped backward several feet and the electric kept on pushing it until a policeman who had been summoned by the lawyer passenger ended the battle. A signal victory for the automobile over the horse-drawn cab as a ramming vehicle had been gained, however, and the chauffeur paid his fine the next morning, satisfied that he had vindicated the cause of the motor vehicle as a public hack.

Rockefeller's Ninth Purchase.

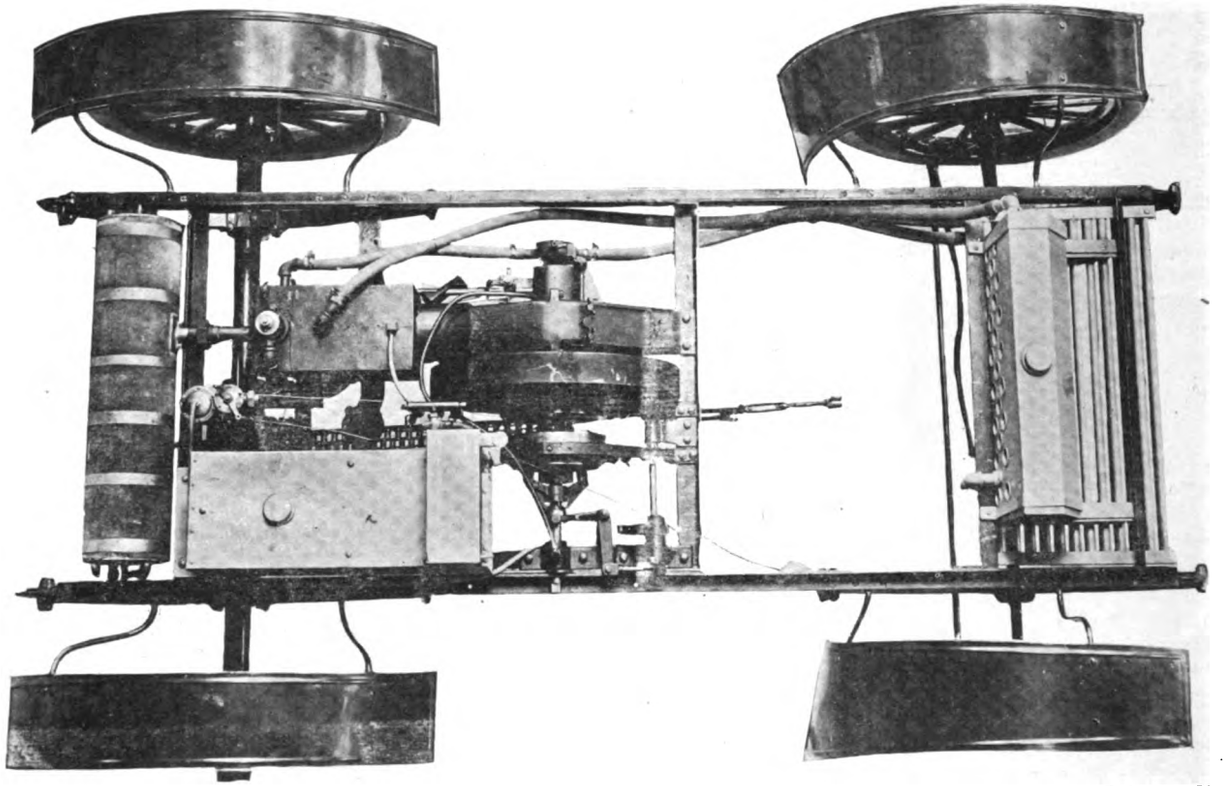
It is frequently remarked with a considerable amount of flippancy that the purchaser pays for the experiments conducted by the maker. The early product of the latter is far from perfect. The user generally learns this to his cost, and changes from one car to another in the endeavor to obtain one that will give him satisfaction.

It is seldom that a maker is able to sell a number of cars in succession. In obtaining from William Rockefeller an order for his ninth Packard car, therefore, the Packard Motor Car Co. finds ample cause for self-congratulation. The sale was made just after the New York show, and the car concerned was one of the new four cylinder Packards. For this the price paid was $8,160, a special design of body being specified.

The Packard was not Mr. Rockefeller's first automobile. He had used several different makes before he purchased a Packard, but once the latter found a place in his stable he has confined himself to it. He has for some time been in the habit of purchasing them in pairs. As stated, the new car, which was one of the sensations of the show, is Mr. Rockefeller's ninth Packard.

Much-Handled French Cars.

Just as an illustration of the way French cars are handled before they get into this country and the number of commissions there are on their price by the time they get here, Norris N. Mason, the new American manager for A. Clement, tells how the American Georges Richard Co. got their cars when he was a member of it and the company had the exclusive control of American sales. He said: "We dealt directly with Overton & Mann, of London. They control the Georges Richard output through having bought in France all the cars secured by other agents there. Lejay is the representative of Overton & Mann in Paris, but he does not deal direct with the factory. He buys through Ernest Cuenod and, I think, there is still some one else between Cuenod and the factory."



This year the Paris-Madrid race is to have a woman competitor. The aspirant for speed honors is Mme. Lockert, the proprietress of La Chauffeur, who is no stranger to the French automobile public, having taken part in the touring section of the Paris-Vienna journey last year.

AMERICAN'S GOOD POINTS

Cleveland Concern's Gasolene Car's Chassis—Some of its Special Features.

Among the cars of recent origin that have met with a favorable reception is the American, manufactured by the American Motor Carriage Co., Cleveland, Ohio. The car was first put on the market commercially early in 1902. For the present season it has been materially improved, and has been placed in the hands of well known concerns in nearly all the leading cities. Of the estimated factory output of 1,000 complete cars 500 have been sold.

The American Model A car is what is usually termed a light touring car. It is a two passenger vehicle, selling at $1,000 and having a radius of 175 miles.

The chassis, shown in he illustration, is constructed with a special angle iron frame, giving the greatest strength with the least weight, which carries the entire mechanism. The single cylinder water cooled motor of 7 horsepower is hung centrally. The transmission, an adaptation of the planetary system, gives two speeds forward and one reverse, the drive being direct on the high speed. All bearings are bushed with a special phosphor bronze, and receive perfect lubrication by gravity feed from a large copper tank, through a system of sight feed oil valves. The transmission and crank pin receive lubrication through the centre of the crank shaft. The same lever that operates the electric switch starts and stops the flow of oil.

The contact is of original design, operating with a plunger in an airtight case, insuring a perfect protection from dust, and is so controlled by a governor that the spark is advanced and retarded automatically. Eight cells of batteries are provided, four being held as a reserve. A Longuemare carburetter is used, giving a mixture that insures perfect combustion under all conditions, and is at all times under control of the operator by means of a foot lever connected with the throttle. A copper gasolene tank is located near the carburetter, obviating the necessity of a long connecting tube, hence avoiding the danger of leaks. The water tank and radiating coil are located in the front hood of the body, while the water is circulated by a positive gear pump, keyed direct to a stud in the end of the crank shaft.

The car is controlled by a hand lever, giving the two speeds forward, while a foot lever operates the reverse, and is conveniently located so that it may be used as an emergency brake. The engine is always under perfect control with the throttle, while powerful brakes are located on each rear wheel. The steering gear is equipped with a large expanding wood rimmed hand wheel, so arranged that it may be easily handled under all conditions.

Especially noticeable in this vehicle are the accessibility of all the parts, the extreme simplicity of construction, the cars exercised in points of detail. In the construction only the best of materials and parts are used, and the claim is made for great reliability, durability and ease and satisfaction in operation.

U. S. Long Distance cars will be handled in Poughkeepsie, N. Y., this year by H. Von der Linden. He has just acquired the agency, and will stock these cars at his Market street wareroom.

Miller Takes on Two Foreign Accounts.

Brampton chains will be handled in this country. Charles E. Miller, No. 97 Reade street, New York, has just been appointed sole United States representative of the makers, Brampton Bros., Ltd., Birmingham, England, and will carry a stock for replacement on imported automobiles. Attractive quotations will also be made to American manufacturers who desire to adopt these chains.

Another recent acquisition of the Miller house is the agency for the Almond Tire Mandril Co. The concern's mandril is used in the vulcanization and repairing of double tube tires. They are inexpensive to operate, and will be found of great service to repairers.

What Made the Chicago Show!

A wealth of rich yellow light streams through the windows of the skylight, and those above the balconies, which, together with the prevailing black and automobile red finish of the several hundred cars, of many types and styles, gives to this exhibition a luxuriousness of tone and a certain soberness and solidity of character never before attained by any automobile or bicycle exhibition in the Western Hemisphere.—From The Automobile.

The Week's Exports.

Argentine Republic.—Three cases motor machinery, $345.

London.—Three cases motor vehicles and material, $135.

Liverpool.—Seven cases motor vehicles, $1,370.

Mexico.—One case motor vehicles, $539; six cases motor vehicles, $1,410.

Digitized by Google

FLOOD OF LEGISLATION

The Seven Bills Before the Bay State Legislature —Opposition now United.

On the summit of Beacon Hill, where the dead and gone worthies of the old Bay State look down on their pygmy successors, a battle royal is in progress over automobiles. Autophobes and autoists have locked horns. As stated last week, no less than seven measures for the regulation of automobiles are now before the Massachusetts legislature's Committee on Roads and Bridges, and the probabilities are that hearings will be announced for February 24 and 25, although those dates have not yet been decided definitely.

Of these bills those of Henry L. Higginson, shutting out all autos capable of making more than twenty miles an hour; that of the Boston Automobile Dealers' Association, that of the Massachusetts Automobile Club and that of Colonel James T. Soutter, for the New England Automobile Association, have already been referred to in these columns. The first mentioned is savagely hostile, while the other three are favorable to the automobile.

A summary of the new bills is given below:

House 936—Petition of Robert M. Shaw. Requires a license from the chief of the district police for every person operating an 'automobile or other vehicle' on a public way. Persons operating cars and trains for railroads or railways are excepted, but no mention is made of persons driving horse drawn vehicles; if licensee is convicted of an offence relating to automobiles his license is voided and he may not receive another thereafter; license fee to be $1, penalty $50 and three months' imprisonment.

House 937—Petition of Frank J. Stanley: Amends act of last year by cutting down speed limit from ten and fifteen miles to twelve and eight.

House 933—Petition of Thomas J. Grady: Requires automobile owners to register machines with the chief of the district police; makes it unlawful to operate an unregistered machine; places fee at $1; the registration to be voided if person registering is convicted of violation of law; machines numbered by chief of district police and to bear the number of a size directed by him, unnumbered machines being contrary to law; autos owned outside the State to be registered in State where owner resides and to be legibly numbered, but if from a State where no provision is made for registering it must be registered in Massachusetts in order to make its use here lawful; requires brakes, horn or other signal, with two lamps on the sides; ten-mile limit for thickly settled parts of cities; park provisions remain intact; no city or town to establish any regulation inconsistent with State law, except that speedways may be separately controlled; chauffeurs must be licensed, fee $1, chief of district police to examine as to "qualifications, character and habits," and to be authorized to revoke license for misconduct; licensee to wear his number legibly displayed on his cap or hat; stop for frightened horses, slow down for cross streets where travel is frequent.

The arrangement of a truce between the Boston Dealers' Association and the New England Automobile Association places the opposition to adverse legislation on a better footing. There was a conference last week between Elliott C. Lee, Frederick Tudor, jr., and George R. Alley, on the part of the Massachusetts Automobile Club, and W. E. Eldridge, Harry Fosdick, S. K. Dingle, H. E. Marvel and A. J. Coburn, on the part of the dealers, and under a new arrangement is is likely that the legislation proposed by both factions will be looked after by the same counsel. Bordman Hall, who as a lawyer member has been taking the lead in legislative work, moved that the club accept ex-Judge Dewey and Robert Southworth as its legislative agents. These are the gentlemen who have been acting on behalf of the dealers. The club voted to leave the matter to its legislative committee, but it is likely that there will be no further differences over the question of counsel.

Four of the automobile bills have been set down for hearing before the Committee on Roads and Bridges at the State House on March 6. These are the two licensing bills of Thomas J. Grady and Robert M. Shaw, and the bills proposed by Robert Clement and Colonel James T. Soutter on behalf of the automobile clubmen to extend the speed limit. No date has been set for hearing the Higginson bill or the bill put in by the Automobile Dealers' Association.

Gave Governor a Ride.

There is nothing like having a friend at court. In view of the flood of automobile legislation in Massachusetts, the importance of having the Governor familiar with the behavior of an automobile is obvious. Last week, therefore, Governor Bates was approached and readily consented to take a ride. He was placed in a Winton touring car, and, in company with Judge Dewey, Harry Fosdick and a chauffeur, was taken out Commonwealth avenue to Auburndale, Boston's show suburban road. Object lessons were given him in the manipulation of a powerful car, and at the conclusion of the ride the Governor expressed himself pleased as well as astonished at his experience.

More Chicago Assininity.

As befits the Windy City, Chicago has gone the limit in autophobe legislation. Alderman Bellfuss will introduce an ordinance requiring the placing of a safety appliance on the front of every automobile. Fenders and pilots are mentioned as safety appliances.

Georgia Legislator Goes the Limit.

In the Georgia legislature recently a bill was introduced prohibiting the driving of automobiles on the public roads. There is no likelihood of its passage.

TRUCE IN BOSTON WAR

The Dissenting Organizations Reach an Agreement and First Show Opens Harmoniously.

An adjustment of the differences between the rival Boston organizations, the Boston Dealers' Association and the New England Automobile Association, has been arrived at. Several meetings were held last week for the purpose of promoting harmony. The upshot of it was a virtual agreement to bury the hatchet and work on a common basis.

It was too late to combine the two shows, but a plan has been agreed to which differentiates one from the other so completely that they can no longer be regarded as rivals. The show planned under the auspices of the new organization, the New England Automobile Association, to be given this week from Tuesday through Saturday, in the main hall of Mechanics' Building, will take the form of an automobile carnival, at which all kinds of tricks and contests and demonstrations will occupy the programme to the exclusion of any mere still-life exhibition of vehicles. The Massachusetts Automobile Club will conduct it, club members will use their own machines, and the local dealers have joined in with them to assist with demonstration vehicles. The affair will be, therefore, not so much an exhibit of the latest models of machines as a five day object lesson in what the automobile will do, and the ease with which it may be managed and controlled. Brake tests, grade climbing and various other stunts are to be included, and it is likely that some of the legislators who are to pass on the automobile bills now in the hands of a committee will be invited down to get the benefit of the demonstrations.

While the dealers join in with the club to make the week's carnival a "go," the club, on the other hand, has formally given its approved of the dealers' show set for the week of March 16, in Symphony Hall, and that show will be primarily the exhibition of latest models of all the automobiles purchasable at Boston agencies.

In the presence of several thousand people, many of them prominent in society, the "Automobile Carnival and Exhibition" was opened at Boston on Tuesday night.

The evening programme included fancy riding and obstacle and slow races. Robert Ross successfully performed on a tether board and rode among ninepins placed to embarrass him. A big Pope-Robinson touring car was also driven on the tether board. There were four competitors in the slow race, which was won by Mr. Peabody.

The exhibition will continue throughout the week, and frequent changes of programme will be made.

No less than 230 entries have been received for the Paris-Madrid race. This is considerably in excess of the number entered in any previous event.

How the Colony is Growing.

In the neighborhood of Thirty-eighth and Thirty-ninth streets there are now so many establishments that there is prospect of this locality becoming the busiest automobile centre in the city. The Electric Vehicle Co. now has its sample cars in its new place at 134-138 West Thirty-ninth street, and the entire block looks like an automobile row because of the spacious, showy front of this store. A few doors below the Electric Vehicle place, at 146-148, a new interior is being built for the Smith & Mortension Co., now at 150 West Thirty-eighth street. They expect to move in some time this week.

The new store has a frontage of 55 feet, a depth of 85 feet and will be two stories in height. With this change the Smith & Mortensen concern will take on some new lines. The Knox Automobile Co. will have a part of the place as a sub-tenant, and show Knoxmobiles, while the Whitney, the Kensington and probably the Automotor lines will be handled by the Smith & Mortensen Co. The Kensingtons they will sell through an arrangement with Homan & Schulz.

Peerlesses and the Bankers' Palace.

C. G. Wridgway, of the Banker Brothers' "palace," in West Thirty-eighth street, New York, is a very busy man these days. He returned on Monday from a trip to the Peerless factory at Cleveland, where everything is being rushed, and he says that Banker Brothers will take practically the entire output of Peerless cars for 1903. On the two floors of the store there are sixteen of the two-cylinder touneau cars, and of these only five are unsold. Six of these cars have been sold within a week, Jesse Lewisohn and his brother Oscar being two of the buyers. The five left can be delivered on the spot for spot cash. The demand for the four cylinder cars is not so great as for the two cylinder, but they are being turned out more slowly and orders for them taken now are for delivery in May or June. The Peerless racing car, Manager Wridgway says, will surely be finished by April 1. The branch place of Banker Brothers at 50 West Forty-third street, will be retained for storing and repairing, and also will be used as a painting shop. A considerable business in renting Peerless cars is being done.

To Satisfy Insistent Customers.

A neat way of managing so as to satisfy customers with deliveries is followed by Homan & Schulz, the pushing New York agents for Northern runabouts at 134 West Thirty-eighth street. Shipments are now being made very regularly from the Northern factory, but Homan & Schulz are selling them as fast as they can get them, and if it was not for good management would often be without any new model to show.

The firm makes a rule to keep four new cars unsold on the floor of its store. When a customer buys a car he is told that he can get it in ten days or two weeks, depending upon the way sales are going and the way shipments are arriving. As a rule this is all a man wants, but if a man insists upon having a car at once he is accommodated by turning over to him one of the four held in reserve. Sometimes a buyer accepts a promise of delivery two weeks later and comes back in a day or two to announce that he has changed his mind and wants the vehicle for use on Sunday. Instead of being obliged to turn him away, the concern pleases him by handing over one of the reserves. The reserve sometimes dwindles to three or two, but it is never allowed to happen that there is not one car on hand ready for an insistent cash customer. It is simply a matter of diplomacy in booking orders so as to always provide for the reserve stock. Homan & Schulz express themselves as highly delighted with the new carburetter in the 1903 Northern, which, they say, "works like a charm!"

How Oldsmobiles are Sold.

"How do you deliver cars to your customers? That is, do you let them go to the freight depot and get them, or do you take them to their homes or place of storing?"

"Neither, exactly," replied R. M. Owen, manager of the Oldsmobile Co.'s place, at No. 138 West Thirty-eighth street, New York. "We never deliver a car until after we have tested it ourselves, and we never relinquish possession of one until the last dollar of the purchase price has been paid and we are sure the buyer thoroughly understands the management of it. We are getting about a carload of cars a week now. They come six in a car, all set up, ready to be charged and run. After we get notice of their arrival we send a couple of men up to the depot, usually Thirty-third street and Eleventh avenue, with five gallons of gasolene, which is enough to run six cars from there to the store here. In a couple of hours they are all here, and then the buyers who are waiting for them are notified, but not until after every car has been overhauled. The best record of sales we have had this winter is seven in one day."

Deal for Darracqs That Failed.

Darracq cars are not to be sold at the Automobile Evchange and Storage Co., 133-139 West Thirty-eighth street, New York. The Darracq store of F. A. La Roche, at 652 Hudson street, is the headquarters in this country for the crack hill climbers. Manager Robinson of the exchange was negotiating to represent the Darracq, but the deal has fallen through, and Mr. Robinson is now looking for some good American car to sell. He has taken on the Orleans French car, which here will be sold as the King of Belgian car. Since the alterations have been completed, the establishment of the new company presents a very attractive appearance, and a good business in second hand cars is being done.

When one Chauffeur is Happy.

It now appears that it is a Peerless car which Police Commissioner Greene has been using for his weekly peering excursions to police stations and Raines law hotels. The car is one of the 1903, two-cylinder models, with a green touneau body and, as has been published, it has acquitted itself creditably so far as speeding goes. It is a great opportunity for an automobile concern to show the efficiency of its car when it has the Commissioner of Police for a passenger, and a perfect picnic for the chauffeur in charge, who can then "let her flicker" without fear of police interference. The car used by the police commisisoner is hired in in the ordinary way at the Banker Brothers' "palace," at 141 West Thirty-eighth street, and the chauffeur who operates it always makes it a point to get the commissioner or the accompanying inspector on the front seat, where he will be in plain view. Thus guarded the chauffer is only too happy when the commissioner admits being in a hurry, for he is then delighted to get up speed and take the chances of arrest.

Carried Four up Fort Lee.

Of the numerous hills that uprear their heads in the vicinity of New York none is more famous than that at Fort Lee, on the New Jersey side of the Hudson River, opposite One Hundred and Twenty Fifth street. Long, steep and with a surface none too good, it is calculated to test the power of any car, and has in the past been a favorite trying out ground.

During show week particularly it is visited by operators who wish to prove the hill climbing ability of their cars. Many succeed in ascending it, but not a few fail ignominiously.

By conquering it with ease the Cadillac last week made good its claim to efficiency, and may be said to have made its Eastern debut in an impressive fashion. On Saturday last a Cadillac, with tonneau body and laden with four passengers averaging 175 pounds, was sent up the hill without a falter. The occupants were J. F. Cutting, of the Cadillac Co., of New York; two prospective customers and a chauffeur.

How the French Creeps in.

"Defense de fumer" is the sign that encounters the eye at the Barry & Hayes establishment and other stores where French workmen are employed. On the same wall is the English version of the warning or command, "No smoking." There are few visitors to the garage who do not understand one or the other admonition.

Cadillacs in New York.

The report that John Wanamaker would handle the Cadillac gasolene cars at his two stores proves to be only half true. It is the Philadelphia establishment only that will do so. In this city the Cadillac Co., of New York, has secured the agency, and will sell the car at its new store, No. 151 West Thirty-eigth street.

PAINTING THE CAR

Not Such a Simple Task as it may Seem — The Care and Materials Necessary.

"Ability to determine what is really good economy is an important part of the carriage painter's trade. Good economy dictates the purchase and use of the best brushes to be had. The best costs but a comparatively small advance over the poorer sort, and better and faster work can always be accomplished with the good tool. Besides, the best furnishes a greater term of service," says The Hub.

"Pitting of varnish not infrequently comes from varnishing over a surface of color not quite dry. Better postpone varnishing until the color is absolutely dry and thus escape the pitting deviltry.

"The premature display of fire checks upon the finished surface can with accuracy be attributed, generally speaking, to coating up a surface too rapidly and not giving each coat of paint or color adequate time to dry. Fire checks may be drowned out with a fresh application of varnish, but in due time they may be expected to reassert their presence.

"A few years ago much was heard of the eggshell gloss coat, but the deceptive nature of these coats has been freely demonstrated, with the result that the eggshell gloss has in the main been severely let alone. In the economy of the modern system of quick painting the eggshell gloss has no place. It is the cause of surface disorders in plenty.

"A handsome belt panel color for a light delivery wagon is deep buff. Gold or aluminum letters and ornamental effects on this color, with red or green shadings, yield dignified and aristocratic conception in color. Deep buff is made of white, yellow and red, the depth of the buff being regulated by the greater or less proportion of yellow and red used.

"The velvet or wool sponge that has a fine, soft, fleecy texture, but withal tough and leathery in its fibre, is the only economical sponge, regardless of the cost, for the average painter to buy.

"Even to-day the paint shop visitor does not need to go way back to find the pig trough style of brush holder, into which paint and color brushes, including camel's hair brushes, are thrust indiscriminately. This way of keeping brushes ought to be obsolete, and, as a matter of fact, is obsolete in the up to date shop. All brushes should be hung upon wire supports and kept in dust proof compartments.

"The leading factory finishers invariably strain their varnish before using, and if these experts find the practice conducive to the best results the jobbing shop painter may well accept it as a good one to follow. Straining the varnish before using is an important safeguard.

"For use upon an old vehicle, such as often rumbles into the paint shop during the spring months, with gaping checks about the hubs and felloes, etc., a putty that dries hard, but remains elastic and grips fast with bulldog tenacity, is made of four parts whiting, one part dry white lead and one-fourth part litharge, these pigments being mixed to an easy handling consistency with boiled linseed oil.

"When sponges and chamois skins are used they should be washed out in soap and water and then carefully rinsed in clean water until all traces of the soap are removed. Then dry out gradually and naturally. If dried too quickly by stove or steam heat the skin gets harsh and breaks easily. The old witchcraft notion that washing sponges and chamois skins in soap and water is dangerous has been buried as securely as Captain Kidd's treasures.

"The party who shakes varnish before using—and you will find them quite numerous—deserves a like treatment. Never shake varnish. Take it from the can in a normal condition. Use it in a common sense way. Give it a chance.

"A good glazing putty may be made of white keg lead thickened with coach japan, seven parts, and hard drying finishing varnish, one part, the mass then being thinned to the proper consistency with turpentine.

"The natural pumice stone, or lava, the product of the untamed volcano, is no longer largely used in surfacing carriage work. The composition rubbing stone, uniform in texture, less easily chipped or broken, and superior in other ways, has taken its place. The composition stone rubs to a very fine surface, and that economically.

"The real worth of a glazing cover depends to a large extent upon the quality of the ground over which it is used. A perfect ground provides for a perfect glaze coat, other things being equal, and an imperfect ground invites a disordered glaze coat.

"The bulging of putty, so-called, put upon a plain basis of fact, is not due to any eruptive tendency of the pigment. Unseasoned wood causes putty to mis-shape itself after being placed in position. Moisture working below the putty ejects the pigment from its place and leads to the misapprehension that putty swells. Properly mixed, putty does not swell.

"Insufficient ventilation has ruined many a painter's health and caused a multitude of paint and varnish surfaces to go wrong. Ventilate, if it has to be done, by raising or lowering the windows. In the paint shop fresh, pure air is as necessary as paint or a painter.

"Never allow sponges and chamois skins to remain immersed in water when not in use. Dry them out and lay them away in a dust proof receptacle. Rancid and dirty shop accumulations, if allowed to settle upon the sponge and chamois equipment, work a quick and permanent injury to it.

Cheap, inferior rubbing varnish is a snare and a stumbling block to the painter who sincerely desires to make his work both comely and durable. A strictly fine, reliable rubbing varnish, regardless of the price, is in the end the most economical.

"The ring cracks on carriage running parts so common in this 'paint your buggy while you wait' age are due, as a rule, to crowding one coat of paint upon another before the first is properly dry. Lead coats should be dry from top to bottom, otherwise the whole paint structure is menaced.

"In the clean paint shop the workmen can accomplish better and quicker results than in the dirty one, with less loss of energy and avoirdupois. Why not clean the shop out at least every other day, and thereby make more money and live longer? Think it over and resolve to hereafter keep the shop a little cleaner.

"Only light reds and light wine colors look well striped with aluminum. The dark shades of red and wine color appear to bleach the aluminum until it looks like white paint, whereas the light shades reflect the aluminum at its true color and lustre.

"To eliminate the verdigris property from gold bronze and thus render it less susceptible to change from the action of atmospheric elements or to the ordinary flow of varnish mix the bronze in benzine and stand over night. The verdigris will work to the top of the mixture, and can be poured off.

"It is advisable to grease the new pencil and lay it aside for a time before using. The grease softens the hair, increases its elasticity and gives the pencil 'hang' and 'poise.' To straighten 'kinked' or frizzly pencils heat a piece of tin, run grease over it and then work the crippled pencil in this. It will straighten a badly kinked pencil or brush.

"The purchasing painter should own a hydrometer, if only to expose the shifty scion of adulteration. The turpentine that registers above 31½ degrees or below 30½ degrees is unmistakably adulterated and should be rejected. A Baume hydrometer registers pure turpentine at 31 degrees.

SWEET INNOCENCE.

Automobilist (with his eye-protectors on): "Why do you wish to give me a penny, my child?"

Unsophisticated Child: "Aren' you blind, then?"

SWEET ON STEAM

Lecture by Cornell Professor Brings Out Interesting Points—Why Boilers Don't Explode.

On Tuesday night the members of the Automobile Club of America were invited to listen to a lecture by Professor John E. Sweet, of Cornell University, on "Steam Power for Automobiles." Professor Sweet said that he was not prepared for a lecture and he gave a detailed account of the building of an engine after designs of his own. It was an interesting recital, for the engine was a novel one in being devoid of packing boxes and having a far lesser number of working joints than most engines. It was one that developed 10 horsepower and had two cylinders, one high and one low pressure, set at right angles. He expressed it as his opinion that there was no economy in small compound engines, in none much less than 100 horsepower.

President Shattuck presided at the meeting, and he inaugurated the discussion by telling of his experience with one of the first Serpollet motor cars, eight or nine years ago. He said that Serpollet heated his boiler until the tubes were a cherry red, then said: "Now I am going to pump water into it and we will start. Climb up on the seat." Mr. Shattuck said that he had always believed that pumping cold water into a hot boiler would cause an explosion, and he climbed on the seat and sat over that boiler after saying a prayer, only because he was not going to be outdone in courage by a Frenchman. If Serpollet was going to stand by during such a crazy proceeding, he would. However, no explosion occurred and they rolled along merrily until it was desired to stop. The stop was effected by stopping the engine and putting on the brake. The vehicle came to a halt after slewing around in a complete circle. The inventor said that was the usual thing.

A discussion concerning the liability of steam boilers to explode and the danger therefrom was entered into, and the question was asked why the little Locomobile boilers never exploded. It developed that tubular boilers of this type cannot be made to explode. President Shattuck told of watching an experiment made to prove this, when a Stanley boiler was placed in one cellar and watched from another cellar until it had been run up to a pressure of 1,500 pounds. Then it was found that the tubes had expanded until the steam had forced its way out quietly and that was all. J. A. Hill told of similar experiences and said that instead of exploding boilers of this type would yield at the ends of the tubing, one tube after another giving way, until the excess pressure had been relieved, the same as through the slow working of a safety valve. Another member explained that this peculiarity was largely due to the copper shell of the boiler being heavily wound with piano wire, so that its power of resistance was much greater than that of the boiler tubes.

J. A. Hill provoked roars of laughter several times by his droll way of narrating personal experiences. He said once there seemed to be an idea that there would not be much harm done by the explosion of little boilers. He learned differently when he was a boy. He and a chum made a toy steam engine of about "four louse power." The boiler was an old copper tea kettle. One day they thought it would be great fun to explode the boiler, so they stopped up the valve (spout) and put it in the furnace of his father's wheelwright shop when all the hands were at dinner. The bellows were worked by means of a pole from outside the shop until the boiler exploded. When it did so it blew the cinders about so that all the windows were broken. Mr. Hill says he ran, but his father saw him, and after he had seen his father that night he changed his mind about the explosion of a small boiler not being a serious thing.

Mr. Scarritt—"There seems to be an idea abroad that in the future steam will be used for heavy tracking and gasolene for touring purposes. How do you think about that, professor?"

Professor Sweet—"I guess that is about right."

Mr. Hill—"Why do you think so?"

Professor Sweet—"I don't know. You can control a steam truck better than one with a gasolene motor."

Then the question was raised whether motor vehicles ever would supplant horses for general hauling work in cities. Professor Sweet said he thought they would, not entirely, but to a large extent.

Mr. Shattuck—"If they do we have got to have the roads.

Professor Sweet—"Well, all roads would last longer if used by automobiles only, and not by horses, and they would be much smoother and cleaner. This is a consideration that may be just enough to turn the balance in favor of motor trucks, as against horse-drawn vehicles."

In his preliminary remarks, before introducing Professor Sweet, Mr. Shattuck alluded to the objectionable legislation being attempted in New Jersey, and said that members of the A. C. A. were in sympathy with their New Jersey fellows in their opposition to the Scovill bill, and then referred to the vexations of the automobilists with the anti-automobilists at Albany, who generally come from Long Island. He said that the automobilists would draft amendments to the Cocks law, and that the antis would then graft on some oppressive clauses of their own, which would start the argument all over again, so that thus far nothing had been done. If the automobilists could only keep up the argument until the 1st of May, he said, the legislature would adjourn without anything having been done. He was afraid, though, that the argument could not be prolonged till then.

OLDSMOBILING IN MEXICO.

Being Built for Nourse.

A new wonder worker in the way of a big, high-powered car is being built in New York City by N. W. Schlater, formerly with the Automobile Co. of America. H. R. Nourse, a dry goods merchant, is to be the owner of the car, which may be but the first of a new line of production. It is to be of 60 rated horse power, but capable of developing ninety miles an hour. It has a four-cylinder engine and many original features. It has been in process of construction since September, and is nearly completed.

Winton touring cars will be handled in Utica, N. Y., by the Miller-Mundy Car Co. The concern expects to do a considrable business in this well known make.

ADVENTURES ON THE ROAD

A. C. A. Members Tell of Thrilling, Amusing and Instructive Experiences.

"Danger Points in Automobiling" was the suggestive theme chosen for the "Tuesday talk" of the Automobile Club of America last week, and with President A. R. Shattuck in the chair, several of the members contributed to the stock of information, useful and amusing, previously possessed concerning accidents on the road.

At first the talk revolved about the mishaps due to punctured tires, especially those on the front wheels, and several testified to having been ditched or forced into a collision by the car suddenly swerving because of a punctured front tire. President Shattuck said that he had run for three miles, noticing a repeated bumping, before he discovered that it was due to a punctured front tire. Mr. E. B. Galleher explained that the bumping was due to the pulling in or the breaking of the valve stem, and pointed out that sudden, severe bumps caused in this way were apt to cause a spring to break, for which reason a flattened tire should be attended to at once.

George B. Adams said: "I have had one accident. I was out with a customer, and going along at a pretty good pace when he asked to go faster. I let out a little, and very soon we overturned and the car lay on its side with two wheels up in the air. We were thrown out, but not hurt. I do not know whether the wheels struck something or whether the spill was due to skidding, but am inclined to the latter belief."

Mr. Shattuck—"When it is slippery enough for a car to skid the car is not apt to overturn unless you strike suddenly a dry spot while the wheels are skidding; then if you are going fast you are apt to have a bad time. When a car is skidding in one direction it is natural to turn the steering lever in that direction, and unless you are very expert you will turn it too much and will begin to skid in the opposite direction; then the impulse is to turn back again, and this is apt to cause an upset." President Shattuck then told about his experiences with Street Cleaning Commissioner Woodbury on a cold, frosty morning last fall, when he ran his car over the wet asphalt and made the Commissioner gasp by showing him how it would skid.

This brought up the matter of street sprinkling, and the question was asked what was to be done about the matter. One member, who seemed to be familiar with the Board of Aldermen, told about the Mayor's disapproval of the Marks ordinance, and said that a bill would probably be passed making some arrangement with the present sprinkling association for one year, but under the supervision of the Street Cleaning Department. This member then added:

"I understand that the vote on the Marks ordinance by the aldermen was prearranged, with the understanding that the Mayor would veto it."

J. A. Hill complained that he had experienced narrow escapes because of carriages and wagons on country roads not showing a light in the rear. A general discussion on this subject ensued, and it was agreed that there should be a State law compelling all vehicles to show red lights behind.

James MacNaughtan said that most of his troubles had been experienced when attempting to pass vehicles in the country going in the same direction. He had also had some hardships because of skidding when he was using a Gasmobile with a heavy engine behind, and once he had a front tire punctured in Fifth avenue and the car swerved so that it ran into a team of horses. Then he told of the following:

"Once I was approaching a buggy drawn by a horse. In the buggy were two country women and a big basket of eggs. They were travelling in the same direction I was. I was close up to them and about to turn out and pass them, and I blew my horn. For some unoccountable reason the horse suddenly stopped stock still in the road. My car struck the rear wheel of the buggy and overturned it. The women and the basket of eggs were pitched into the ditch in one conglomerate mess, revealing a most remarkable color scheme. Fortunately the women were not hurt at all, but the eggs were beyond repair and the gowns of the women and their faces were badly mussed. A pecuniary compensation settled matters satisfactorily."

Some one asked about the accident in which Charles Fair and his wife were killed in France. Mr. C. J. Glidden, who went past the scene of the accident soon after it, said that a quarter of a mile from the fatal spot there is a steep hill that has a danger sign on it. Before that there are forty miles of superb road. He saw deep ruts in the grass at the side of the road, which is kept like a lawn. The ruts were six or seven inches deep. From them he judged that Mr. Fair had started to apply his brake on the hill while running at high speed, that the brake had set suddenly and the car had swerved toward a big tree, as indicated by the ruts. Mr. Fair had then evidently turned to avoid the tree and had turned suddenly. The wheels sank into the soft sod about ten inches and the car was overturned. The car, he said, did not hit the tree, although the passengers might have done so. He knew nothing about any punctured or bursted tire.

Mr. Shattuck then said: "We all know that it isn't safe to drive an automobile at fifty or sixty miles on the road, and we know that it is not safe to run at thirty miles an hour unless the road is straight and broad and smooth and we are familiar with it."

Mr. Adams then told of how on one occasion he had blown his horn when he wanted to pass a carriage and one of the women in the carriage had leaped out.

Mr. Shattuck told of an amusing experience with a horse that ran away when he was approaching, going in the same direction. When he overtook the runaway he had stopped and the man was standing in the road gazing straight up at the sky. Mr. Shattuck asked him what was the matter, and he replied:

"Well, I guess I'm drunk. Say, have you got any whiskey with you?"

Emerson Brooks told of a close shave he had from a big smashup with a trolley car while going across the Hackensack meadows. His chauffeur was inclined to show off, and he ran full tilt toward an approaching trolley car until very close to it. Then, when he attempted to turn out short, the wheels skidded on the tracks and the car grazed his shoulder so closely that his heart seemed to stop beating.

E. E. Britton told how he mastered frightened horses which reared and plunged at the sight of his automobile and could not be made to go ahead, turn or back up. He stopped his car, got out, went to the horses and picked up one foreleg of one and held it up for a minute or two while pating him on the neck. Then he let go the leg and pulled the horse's tongue out of his mouth while continuing to pat. After treating the team this way he had no difficulty in taking the bridles and making them do whatever he wished. He explained that the horse's brain could only conceive of one thing at a time, and that it was necessary when a horse is frightened simply to give him something else to think about.

E. B. Galleher said: "In my opinion, the danger of accidents is almost wholly a question of the operator. The speed cuts almost no figure; it depends upon the man; it is the personal equation that decides nine times out of ten whether there will be an accident or not. To illustrate this, I will relate my experience with two different men who represent each an extreme of the personal equation. One of them is a man who was one of the first in the automobile business in this country. He is familiar with the operation of every sort of car, and is the poorest operator I know. He does not go fast, but continually gets into all sorts of scrapes. If there is a pocket of vehicles in the street he gets into it. Trolley cars, carriages and women are always getting into his way. He is constantly having close shaves, and frequently accidents. Finally the concern he is with has stopped him from taking out a car because of the damage bills it has had to pay. His fingers seem to be all thumbs, his hands are both lefts, his feet are both lefts and the lobes of his brain are both lefts. He does not seem to see things quickly, nor to think how to navigate nor to act. Mr. Britton has been out with the man I mean, and he knows how it is."

Mr. Britton—"It made me sick, positively."

Mr. Galleher—"The other man is Fournier. I have ridden down Fifth avenue with him at forty miles an hour. He is chatting, smoking and looking at you and all about,

Digitized by Google

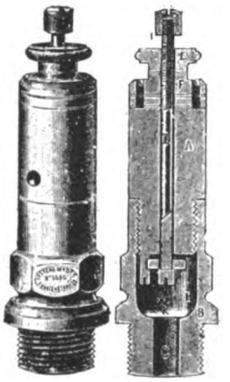
and apparently not at the road; yet he gets through every tangle. If there is a hole in the traffic he finds it. If there is not he goes straight for a place that seems hopelessly blocked, and behold! there is an opening by the time he reaches it. He seldom slows up; he does not have close shaves, and he does not have accidents. This is simply knack, or intuition, as you choose to call it."

A Voice—"How about his accident with the Long Island Railroad train?"

Mr. Galleher—"That was a case where a wildcat engine bore down upon him without warning. Fournier was probably going fast, but there, again, his intuition showed itself when, as quick as thought, he turned his car up the track in the same direction that the engine was going so as to run along ahead of it if possible. That intuitive act saved the lives of his passengers. The car was struck in the rear. If it had been struck broadside the story would have been different."

Mr. Shattuck—"A better way would have been to have approached the crossing slowly and looked about to see if there was any train in sight. I never go over a railroad crossing unless I can first look up and down the tracks."

To corroborate Mr. Galleher's idea of the personal equation E. E. Britton next told of a thrilling experience he had one foggy evening coming in from Sea Cliff, Long Island, with his chaffeur, Fred Walsh: "While running along at a pretty lively pace we came to a place where there were carriages on the right hand side of the road. Suddenly Fred Walsh shot way over to the left, ran into the ditch, slipped the clutch and applied the brake. When the machine had stopped he remarked: 'I don't know whether it was a log or a man.' I had not seen anything. We went back a little distance in the fog and found a drunken man lying in the road. Both wheels on the right hand side of the car had run over his hat and missed his head by a few inches. I have the hat yet as a souvenir. The incident illustrated that quickness of perception, thought and action which Mr. Galleher calls intuition. If Walsh, when he saw what he could not tell whether it was a log or a man in the road, had turned six inches to the right we would have crashed into the carriages and there would have been a frightful accident. As it was, he saw the man in the middle of the road and the carriages on the right simultaneously, and with the perception swung way around inside the man and ran off the road to avoid him. Other men would have avoided one danger by running into a greater."

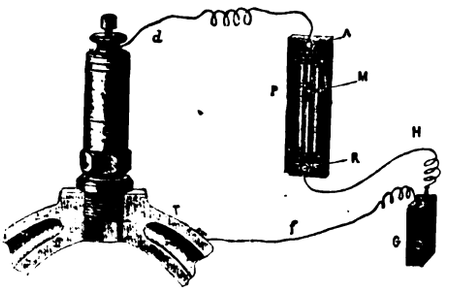


C. J. Glidden told some details of his notable European tour, and recommended the use of wooden blocks for chocks under the wheels when a stop is made while climbing a mountain. They are better than sprags, he said.

Mr. Shattuck indorsed the idea of wedge shaped wooden chocks, and said that he had an idea for a contrivance to be carried along, connected with the axle and dropped by means of chains behind the wheels without leaving the seat.

THAT AUTOMATIC IGNITER

After Being Forgotten it is Again Brought Forward, "Perfected," it is Claimed



Not much has been heard of the electro-catalytic igniter of late. Considerable attention was given to it at the time of its presentation to the public, in 1901, and since, and on several different occasions, it has been put forth in an alleged practical form. But it never made any headway. Announcement is now made that an English concern,

H. M. Hobson, Ltd., is prepared to supply it in a perfected form.

As its name implies, the electro-catalytic igniter utilizes at the same time as electricity the effects of catalysis offered by metals of the platinic series. Certain alloys of these metals, such as iridium, rhodium, palladium, osmium, ruthenium, etc., possess in a high degree the catalytic power. The alloy which enters into the composition of the electro-catalytic igniter is claimed to possess this property of automatically igniting the gases of explosion motors in the highest degree.

The igniter (Figs. 1 and 2) consists essen-

tially of a body, B, screwed outside of the thread of the ordinary sparking plugs, with an inside passage C, leading to a chamber H in which is fixed a coil K of a special alloy, producing by its intense incandescence the ignition of the gases driven into the chamber by the compression stroke of the motor. The coil K is supported by the piece A screwed in the body or shoulder B. At E is a milled nut, under which the wire *d* (Fig. 3), conveying the electric current to the device, is clamped. The apparatus is entirely of metal, porcelain being wholly excluded, so that there is no fear of breakage.

The fitting of the apparatus is extremely simple. It can be effected in a few seconds in the following way: 1, Screw the igniter C in the place of the ordinary sparking plug; 2, fix, by means of a screw, within reach of the driver, at the most convenient spot for operation the small rheostat P (Fig. 30); 3, place the small accumulator, or battery, G in its usual place; 4, connect the terminal A of the rheostat P to the igniter C by means of an insulated wire *d*; 5, connect the terminal R of the rheostat P to any one of the terminals of the accumulator G by means of an insulated wire H; 6, connect by means of a third insulated wire *f* the remaining terminal of the accumulator G to earth by attaching it to any point of the motor T. To start the otor with the new ignition, after having carefully regulated the carburation, the slide M of the rheostat P is placed about midway between A and R (advance retardation) and the starting handle turned. If after a few attempts the motor does not start, the slide M is moved a little more toward A, and so on. When the motor is started the advance or retardation of the sparking is obtained by shifting the slide of the rheostat P toward A or R. After some time, when the igniter is quite hot, if the carburation is perfect, the electric current can be cut off by bringing the slide of the rheostat right over to R, when the ignition will be effected automatically simply by the catalytic effect. The advance of the sparking will also be effected in this case by moving the slide of the rheostat toward A. The motor is stopped by suppressing the admission either by interrupting the carburation or opening the compression valve—after first cutting off the electric current by bringing the slide of the rheostat to R.

Among the advantages claimed for the electro-catalytic igniter are (1) entire absence of porcelain; (2) no transformer or induction coil is necessary, and (3) advance and retardation of the sparking obtained instantaneously. If the electro-catalytic igniter is used on a motor cycle the adjusting rheostat can, if necessary, be dispensed with; in its place a simple switch is inserted, which may be the ordinary switch handle or the handle bar of the machine. In this case the speed is adjusted either by varying the exhaust, if the motor has such adjustment, or by varying the cut off of the gas, or by slightly varying the carburation.

Additional factory space is required by the Century Motor Vehicle Co., Syracuse. Several buildings are being examined with a view to leasing if found suitable. A five story building in the vicinity of the present factory is sought.

Dr. Auer von Welsbach, the inventor of the incandescent gas burner, has devised a new storage battery, the novelty of which lies in the use of cerium salts.

DISCOVERED ONCE MORE

"First Steam Automobile" Again Crops up Surrounded by an Interesting Story.

From Lowell, Mass., comes a wonderful tale of the "first steam automobile ever built." Its history is, if the chronicler is to be believed, an interesting one, the story of its wanderings over the length and breadth of New England, made to do "stunts" at village fairs for yokels who gaped at it in amazement, a fascinating one. It made fortunes for its owners—not its inventor, however. He was the traditional inventor, unhonored, unwept and, until now, unsung.

"When was the first automobile built?" asked the reporter of the Lowell Sun of James Roberts.

"In 1865," quickly replied Roberts. "We called it a steam wagon," he continued, "but it was built on pretty nearly the same principle as the automobile. A fellow by the name of Roper built it. He lived in Roxbury, and he was a genius.

"I suppose I could tell you enough about that wagon to fill a book. I haven't seen it for a long time, but I know it is stored somewhere in Howard street in this city." Roberts went on to describe how the wagon was constructed, and when he came to tell about the steam it carried he chuckled. "The outsider never could tell how much steam we had on. The indicator didn't tell the truth. The men who owned it wanted it to lie, and it did. When it registered fifty pounds we had 100 on, and we could raise it to 150.

"I don't suppose there ever was anything invented that made more money than Roper's steam wagon. I handled it for about a year, I think. I made a mile in Poughkeepsie, N. Y., in 2 minutes and 20 seconds, and a little later I cut the record to 2 minutes and 12 seconds.

"I ran the steam wagon from Boston to Springfield in 1865. We gave an exhibition there and at New Britain, New Haven and in different parts of New York State. We went to Saratoga, and while there I took General Grant twice around the track. We led the Spaulding & Rogers circus for six weeks, and we took in cattle fairs and everything else in the West and Canada.

"I had great fun while we were with the circus. We used to parade in every city and town. We took the lead with the steam wagon and the elephants followed. I have seen people in various towns and cities so scared of the wagon that they would run away from it.

"The money that the wagon made at fairs and such places was as nothing compared to the money that the four slick articles who owned it made on the side. I know that one of them made $30,000 in one day. I drove it in some of the races that the four men had fixed and on which they had money bet.

"I tell you that wagon was a gold mine. All of the four men who owned it made fortunes. They weren't on the level, and the man who stacked up against them with a horse or anything else was sure to get the worst of it. The men that owned it were betting on the outside, and people didn't know who they were. They didn't care whether they bet on the wagon or the horse. It was all the same to them. The driver had instructions, and he was supposed to know his business.

"Charcoal was the fuel used, but we also used camphene. One fire would carry the wagon about three miles. I remember once in Hudson, N. Y., there was a man bet me $50 that I couldn't carry him up the hill to the Mansion House. I carried him there in double quick time and he paid me the $50. He said it was the fastest uphill ride he ever had in his life.

"Of course," said Roberts, "you understand that I was under contract to drive the machine as the owners ordered. I obeyed orders without asking why, although in some places I understood the game that was being played, but I had to keep to my contract.

"There are a thousand little incidents that I might tell you about the fun we had with that wagon. As to the character of the owners, I don't know as I would care to tell all I know about them. There's one story, however, that I think you ought to hear. In some place in New York, I'm not sure just where, a horse with a record of 2:26 was matched to race the wagon. His owner believed that he could make a mile in 2:20. He was a fast horse for those days, and if everything had been on the square he would have won the race. The wagon men tried to put their money on the horse, but the outsiders wanted to bet the same way. The four men then turned around, took all the horse money in sight—several thousand dollars, I don't know just how many—and then they issued their instructions to the driver.

"The start was made, and in spite of all he could do the driver of the wagon could not get away from the horse. The fellow in the sulky did not try at any time to pass the wagon. It was serving him as a pacer, and the driver of the wagon the last time around realized that he would have to resort to strategy if he would win the race and save the management's money. The wagon refused to duplicate the speed it made on two other occasions. Before the home stretch was reached the fellow on the wagon took two balls of twine saturated with camphene from a box near his seat, and threw them, unnoticed, into the firebox. Up from the firebox came a sheet of flame. It shot into the air about ten feet and frightened the horse out of a seven years' growth. He went into the air and was acting like a bucking bronco when the steam wagon went under the wire."

In reply to a question as to how extensively the wagon was advertised Mr. Roberts produced the following circular, which he said went the rounds of the newspapers and was also liberally displayed, poster fashion, throughout the various cities that were visited:

"No more use for horses! The world outdone! The days of slow coaches numbered. The family steam carriage, the only vehicle of the kind in the world. This wonderful triumph of science, which is unrivalled for cheapness and durability, has attained the speed of forty miles an hour upon an ordinary road, and when tried upon the track of a horse railroad has reached the astonishing rate of one mile per minute. From experiments undertaken by some of the most scientific men in this country and Europe, who are unanimous in pronouncing it the greatest invention of the age, it has been ascertained that it will run for twenty-five miles upon a single peck of coal, thereby rendering the expense less than one cent a mile. It can be managed by a single person, and, as will be evident to every one who witnesses its performance, it is destined to supersede entirely every vehicle of conveyance now in use. It weighs 550 pounds, which renders it as easy of management as an ordinary carriage.

"The proprietor of this wonderful work of genius, in compliance with general desire, has consented to offer it for public inspection, and will exhibit it for a short time only at ——."

Caught the Horsemen in the Act.

About two dozen automobilists assembled on the road near Seacliff, Long Island on Lincoln's Birthday to watch the races of the Long Island Light Harness Association, held on a measured course on the highway of Seacliff avenue. It is said that some members of the Automobile Club of America were among the number, but this is not known to be true.

It was the declared intention of the automobilists to prosecute the horsemen for exceeding the speed limit specified in the Cocks law. During the races snapshots were taken, and after the races the course was measured. The horsemen at the races are said to have been among the most persistent opponents of the automobilists, and the latter said that turn about is fair play.

Price of Second-Hands in Paris.

Some idea of the prevailing prices in Paris for second-hand cars can be obtained from the following list of such cars offered for sale: A 30 horsepower Mercedes, as good as new, 38,000fr.; a 60 horsepower Mors racing machine, 38,000fr.; a 16 horsepower five-seat Mors, 12,000fr.; a ten horsepower Panhard tonneau, 11,000fr.; a 16 horsepower Delahaye tonneau, 9,000fr.; a 12 horsepower Darracq tonneau, 7,000fr.; a 6 horsepower Panhard tonneau, 5,500fr.; an electric brougham (new), 5,500fr.; a Columbia electric carriage, 4,000fr.; a Mors, four seats, 6 horsepower, 1,000fr.; and a 4½ horsepower Delahaye spider, 800fr.

Back Firing in Induction Pipe.

Sometimes trouble is experienced with back firing in the induction pipe, flame being seen to issue from any orifice between the valve box and the carburetter. This points to imperfect closing of one or more induction valves, due either to unequal wear of the surface of the valve itself or the valve stem in the guide. The valve, with its seating, should be withdrawn and examined. By pressing with the fingers in an attempt to rock the valve on its seating, wear of this kind can be quickly detected. If the valve itself is worn, the remedy is to grind it in with very fine emery powder and oil. Fix the valve upside down carefully in a vice, the jaws of which are protected by leaden sheets, having first dismounted the cap, cotter and valve spring. Smear the seating of the valve with a little oil and emery, and twist the same a quarter turn each way, lifting the valve slightly out of its seat in little jumps by pressing the forefinger of the left hand against the end of the valve stem. The pressure to allow this should be adjusted between the finger of the left hand pressing upward on the valve stem and the pressure of the right hand on the butt of the screwdriver used to twist the valve. This serves to grind the valve and seating down equally all round, and when the ground surfaces show a clean and silvery appearance, and the valve feels perfectly solid in its seat, the job will be sufficiently well done.

When the Fire is at Fault.

When a car using a flash type of boiler is running badly and showing steam it is an indication that the fire is not in a good condition; therefore, wet steam is being put through the engine. This is much more difficult to condense than the superheated steam used when a fire is going properly. The chief reason for the burner failing to give a good fire is that the vaporizing tubes are not cleaned often enough. As a result the carbonic deposit from the oil accumulates to such an extent that only a small quantity of the fuel is served to the burners. Sufficient heat, therefore, is not generated to convert into steam the amount of water delivered to the generator by pumps. If the oil vaporizing tubes are kept clean and free, the pump glands screwed up sufficiently tight to prevent leakage, but not tight enough to cause any undue friction on the plungers, the car will run at its best so far as the generator and its attendant parts are concerned.

Factors in Hill Climbing.

It is always well to remember that engine efficiency alone does not insure hill climbing powers. The number of speed changes provided is a very considerable factor. A car with only two speeds, for example, must take a hill either very slowly or at speed. The drop to the low speed is a considerable one, as on it the speed will frequently get down to four or even three miles an hour. The extremes are not so great with a three speed gear, while with one having four speeds there is no great variation in the running.

Even then, however, and especially with cars having an abundance of power, the driver likes to keep to the high speed at all times. If he has to slow for traffic he will throttle his engine in preference to shifting to his third speed. Similarly, if a very steep hill is encountered he will keep on the fourth speed until the very last moment—until it becomes apparent that the engine will stop unless it is given relief by means of the change gear.

Consequently both the number of changes and the ratio of the gearing have to be taken into account, along with the engine power, in determining whether or not a car is a good hill climber and whether the engine is delivering the full power. Many autoists neglect to take these factors into account.

Accumulating Impedimenta.

Between the desire to be prepared for practically any mishap that may occur on the road, and an indisposition to carry too much in the way of repair impedimenta, the average autoist is puzzled to know how to fill his tool box. Usually he keeps adding to it, putting in a coil of wire, extra wrenches, a lifting jack, etc., as the necessity for them arises, until he gets such an accumulation of odds and ends that some day he cleans the whole thing out and starts in fresh. Then he gets caught without some simple but badly needed part, and resolves to start in again. The matter is one that is worth attention, and the careful autoist is beginning to recognize the fact.

Awards for Timing Apparata.

Awards have been made by the Automobile Club of France as a result of a trial of automobile timing apparatuses on the Dourdan route. The first prize of 600 francs ($120) was given for a Morse system and 400 francs ($80) for a Stralsec system. The Morse system will probably be officially adopted for short distances. Its main features are those of a chronometer and ribbon, like a Morse telegraph, and a needle, which marks the time in fifths of seconds.

When Compression is Poor.

Compression is never very good when tested immediately after the exhaust valve is ground in, when the engine is cold. It is only after the engine has run for a time and the valve and seating have grown hot that they become thoroughly adapted to one another, and the compression is appreciably improved.

The Captain's Coming Glory!

"It is understood that Captain C. A. Roby will become a votary of the 'gasolene chuck, chuck,' before the autumnal red again blazes on the maple hillsides," says the Nashua (N. H.) Telegram.

"Man," not Master, Guilty.

Honors are with W. K. Vanderbilt, Jr., in the appeal from the sentence by default which was imposed on him in Paris for excessive speeding last summer. He has established an alibi, and now the prosecution seeks to shift its case from Vanderbilt to his chauffeur, Coubac by name.

Coubac testified that Vanderbilt was not in the automobile, whose only occupants were the Duke of Marlborough and himself. An affidavit of the Duke of Marlborough to the same effect, taken before the French consul in London, was also introduced.

An amusing scene occurred when Coubac finished his testimony. The justice said that, in view of the evidence, it seemed proper that the chauffeur should be brought before the court as the accused man, instead of as a witness, and he asked Coubac if he wished to change places with Mr. Vanderbilt, so that the two days' sentence standing against Mr. Vanderbilt could be transferred to him. Coubac protested energetically against the judge's suggestion, declaring he had come before the court as a witness and not as an accused person. But the judge insisted upon the transfer, whereupon Maitre Louis Binoche, counsel for Mr. Vanderbilt, also interposed a strong protest.

"I insist," he said, "that there be a definite decision whether my client is guilty or not guilty. I am opposed to any transferrence of the sentence."

The judge then announced the adjournment of the case until March 18, saying that Coubac would be cited then, not as a witness, but as the accused person.

How Charley Paid his Hotel Bill.

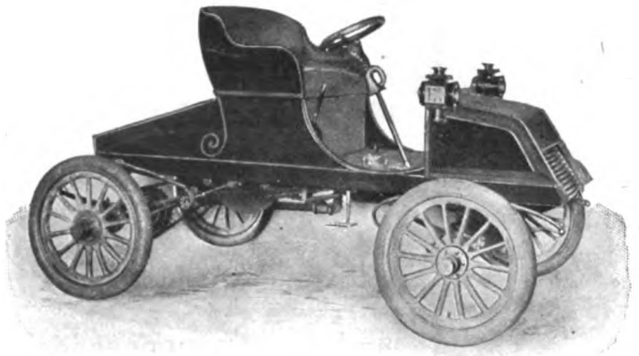
M. Louis Charley, the redoubtable agent for Mercedes cars, paid his visit to America this year with many misgivings. He was doubtful how much would be remembered of his dealings when he was here two years previous. When he left it was in a flurry of excitement that was ludicrous.

He gave up his room at the Manhattan Hotel about half an hour before the time his steamer was to sail. A cab was waiting for him at the door and in settlement of his bill, which was about $100, he tendered a $500 bill. The hotel clerk could not change it, and said so as he reached forward and took hold of it. Hearing this M. Charley tightened his grip on the bill and the pair stood, each having hold of one end of the bill. Charley was frantic with fear of losing his steamer. He would not allow the bill to be taken from him to be sent out and changed. He insisted on a clerk being sent to the steamer with him, where change could be had from the purser. They reached the dock as the signal was given for the gang planks to be hauled down and rushed aboard. Change was obtained from the purser, the clerk was paid the amount of the bill and the steamer was delayed several minutes after her time in order to let the clerk get ashore again.

Cleveland Elects Officers.

At the annual meeting of the Cleveland (O.) Automobile Club, held last week, the acquisition of a clubhouse was given consideration, but no definite steps were taken. After an elaborate dinner at the Hollenden the election of officers to serve during 1903 took place, as follows: E. Schriver Reese, president; Fred. T. Sholes, vice-president; George Collister, secretary; Windsor T. White, treasurer. These, with Walter C. Baker, Charles Shanks, John H. Brown, E. T. Rook and Walter S. Root constitute the directors.

Dayton Decides on Race Meet.



Dayton, Ohio, is the first city to come forward with the definite announcement of a race meet. The Dayton Automobile Club held a meeting last week and took the preliminary steps. A committee was appointed to make the necessary arrangements, and was given full power to act. This committee consists of Earl Kiser, Dr. C. A. Bonner, George Peckham, E. E. Euchenhofer and George Andress. The races will probably be given on May 30.

One Benefit of Club Membership.

Arrangements for a club station have been made with the Columbia automobile garage, corner of Pine and Garnet streets, Providence, R. I., which will be the official station of the Rhode Island Automobile Club. Members will have the use of the garage and the free storage of their carriages for twenty-four hours or any part thereof.

The Week's Patents.

720,326. Process of Preparing Storage Battery Plates. Rufus N. Chamberlain, New York, N. Y., assignor by mesne assignments, to Gould Storage Battery Company, New York, N. Y., a corporation of West Virginia. Filed March 3, 1899. Serial No. 707,592. (No model.)

Claim.—1. The process of treating lead storage battery plates to clean the same and provide them with a roughened or pitted surface which consists in cleaning the plates by exposing them successively to electrolytic action as anodes in a solution capable of dissolving lead, thereby cleaning and roughening the plates and producing a solution of lead, redepositing the dissolved lead on a cathode, and removing said anod plates when properly cleansed and roughened and forming them substantially as set forth.

720,343. Compound Expanding Fluid Engine. Frank Goodfellow, George Goodfellow and Robert Goodfellow, Hyde, England. Filed July 14, 1902. Serial No. 115,511. (No model.)

Claim.—1. In a single acting expansive engine, the combination of two equal low pressure cylinders, a high pressure cylinder between the latter cylinders, pistons in the cylinders, connecting rods connected thereto, a shaft, cranks on the shaft connected respectively to said connecting rods, the two cranks connected to the low pressure pistons being in line and shorter than the crank for the high pressure piston, whose crank is placed at an angle of 135 degrees relatively to the other two cranks, and means for distributing live steam to the high pressure cylinders, and exhaust steam from the high pressure to the low pressure cylinders.

720,361. Method of Regenerating Platinum Contact Substances. Constantin Krauss and Rudolph M. von Berneck, Hoichst-on-the-Main, Germany, assignors to Farbwerke, vormals Meister, Lucius & Bruning, Hochst-on-the-Main, Germany, a corporation of Germany. Filed March 6, 1902. Serial No. 96,922. (No model.)

Claim.—The herein described process of regenerating the platinum contact substance employed in the manufacture of sulfuric anhydrid, which consists in passing through said platinum contact substance a mixture of steam, purified pyrites burner gasses and oxygen, until the resulting gases contain no arsenic compounds, and then introducing dried purified pyrites burner gases and oxygen into the contact substance until the same attains its normal activity, substantially as set forth.

720,404. Controlling Gear for Motor Vehicles. John Q. Chase, Dayton, Ohio, assignor to Will I. Ohmer, Dayton, Ohio. Filed Sept. 30, 1901. Serial No. 77,004. (No model.)

Claim.—1. A controlling gear for motor vehicles comprising a shaft, a pinion mounted to slide thereon and rotate therewith, a disk across the face of which said shaft extends, said disk having concentric rows of female teeth and being movable toward and from the pinion, and a lever fulcrumed to move in planes at an angle to each other and operatively connected with both disk and pinion, the movements of the lever in one plane controlling the movements of the disk toward and from the pinion, and the movements of the lever in the other plane controlling the movements of the pinion across the face of the disk, substantially as described.

720,563. Storage battery system. Rufus N. Chamberlain, Depew, N. Y., assignor to Gould Storage Battery Company, New York, N. Y., a corporation of West Virginia. Filed Oct. 17, 1901. Serial No. 78,945. (No model.)

Claim.—1. The combination with the storage battery, the end cells, the end-cell switch and a circuit connected to the storage battery through said switch, of a polarization cell or cells connected between the two sides of said end-cell switch and having a counter electromotive force substantially equal to the electromotive force of the end-cell sections included between successive positions of the switch, substantially as set forth.

720,577. Electric battery. Edwin R. Gill, New York, N. Y., assignor to Invention Developing Company, a corporation of New Jersey. Filed June 26, 1900. Serial No. 21,680½. (No model.)

Claim.—1. In a test set, a retaining block containing cavities opening at one surface of the block, battery-cells in said cavities projecting slightly beyond their orifices, and means operating by spring tension for holding said cells in place, substantially as described.

720,592. Electric battery. Milton M. Kohn, Chicago, Ill. Filed July 31, 1895. Serial No. 557,661. (No model.)

Claim.—1. In an electric battery, the combination with a retaining vessel, positive and negative elements, and an excitant therein, of means for sealing said retaining vessel, a valve 24 having passages 27, and a threaded passage 26 communicating with the passage 27 and with the atmosphere, and a threaded plug fitted in the upper end of said threaded passage, substantially as described, and for the purpose specified.

720,639. Pneumatic tire. Francesco Toni, London, England. Filed Sept. 8, 1902. Serial No. 122,580. (No model.)

Claim.—1. A pneumatic tire for heavy vehicle-wheels consisting of a tire-cover, of an air-tube located within said cover, of enlarged flexible but incompressible rectangular-shaped beads formed on the edges of said cover, of a wood felly, of rectangular rabbets formed in the outer edges of said felly and adapted to receive the beads of the tire-cover, of annular rings formed with rectangular rabbets, one of said rings on either side of the felly and engaging the said felly and the outer side of the bead on the cover, of nutted bolts passing through said rings and fellies for securing the rings to the felly and of a flat annular plate permanently fixed to the periphery of the wood felly and having edges overhanging the rabbets in said felly and engaging the enlarged beads of the cover, as set forth.

720,653. Electric battery. Vincent G. Apple, Dayton, Ohio. Filed June 3, 1901. Serial No. 63,012. (No model.)

Claim.—1. In an electric battery, the combination with a conducting containing-case, of a vertical series of lateral bars joined to the sides of said case constituting a supporting structure for active material, a series of said structures in said case, and a series of removable plates or guids in alternating position with said bar structures, substantially as set forth.

720,713. Motor-vehicle. Charles A. Lieb, New York, N. Y. Filed Apr. 5, 1902. Serial No. 101,603. (No model.)

Claim.—1. In a motor-vehicle, the combination with a pair of pivoted axles, a reach pivoted to each axle, pairs of links connected to each axle at one end and pivoted to a plate at the opposite end, and means for moving the plate transversely of the axis of the vehicle, whereby the angular inclination of the axles as regards each other may be altered.

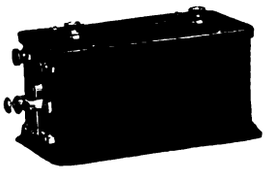
720,752. Internal-combustion engine. Constantine L. Straub, Perth Amboy, N. J. Filed Mar. 14, 1902. Serial No. 98,252. (No model.)

Claim.—1. The combination, in an internal-combustion engine, of two differential cylinders and pistons, having their lower, or pump pistons, secured to their upper or working pistons by means of open legs, and provision made whereby, at every up-

Digitized by Google

ward stroke, the pump-pistons can charge and compress into their respective pump-cylinders and working pistons a certain amount of air, preparatory to forcing it into the opposite working cylinder, through ports which are uncovered by the downward movement of their respective working pistons, at or near the end of their crank-stroke, substantially as described and for the purpose specified.

720,759. Explosive-engine. Henry W. Tuttle, Philadelphia, Pa., assignor to John M. Scott, Philadelphia, Pa. Filed May 2, 1902. Serial No. 105,599. (No model.)



Claim.—1. In an explosive-engine, a piston adapted during its upstroke to compress the gas or equivalent hydrocarbon in an induction-chamber and during its downstroke to compress fresh air in an air-compressing chamber and to feed the same to the base of the explosion-chamber, combined with means for regulating the amount of gas entering the induction-chamber and the fresh air entering the air-compressing chamber, said means comprising a tubular rocking valve and a spring-controlled puppet-valve both adapted to control the entrance of the charge to the induction-chamber, and a valve adapted to control the amount of air entering the air-compressing chamber and connected to one of the gas-induction valves for simultaneous operation.

THE PLEASURES OF AUTOMOBILING

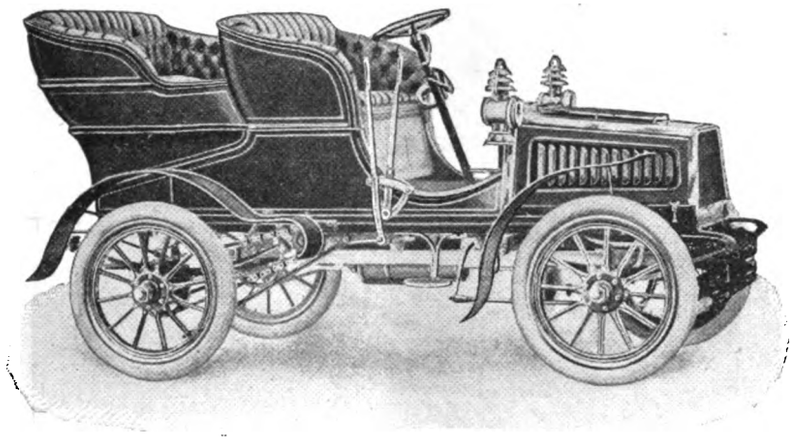
WILL BE GREATLY ENHANCED BY THE USE OF

HARTFORD or DUNLOP

PNEUMATIC TIRES

The ORIGINAL and "MODEL" TYPES of SINGLE AND DOUBLE TUBE TIRE CONSTRUCTION

Appreciating the fact that requirements vary as to Single Tube and Detachable Tire Construction, we offer the most reliable of both types—*The Honest Standards.*



THEY WERE BEST YEARS AGO. AND YEARS OF INTELLIGENTLY PERSISTENT, CAREFULLY DIRECTED EFFORT HAS MADE THEM BETTER TO-DAY.

Where Quality is desired—where Comfort, Durability, and Protection against Annoyances is wanted—where All-'round Satisfaction is demanded—these tires should be adopted. Let us prove this to you by sending you signed statements from some of the most prominent makers and users in this country.

The Hartford Rubber Works Company, Hartford, Conn.

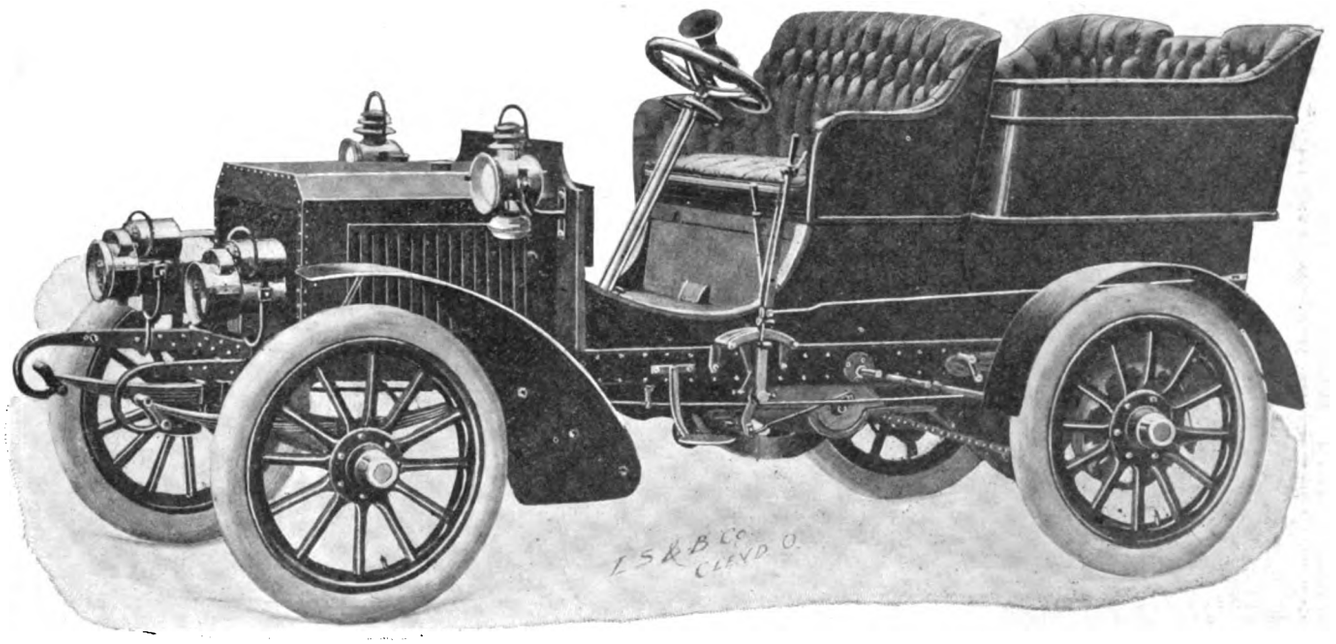
An Automobile of Quality.

"Toledo"



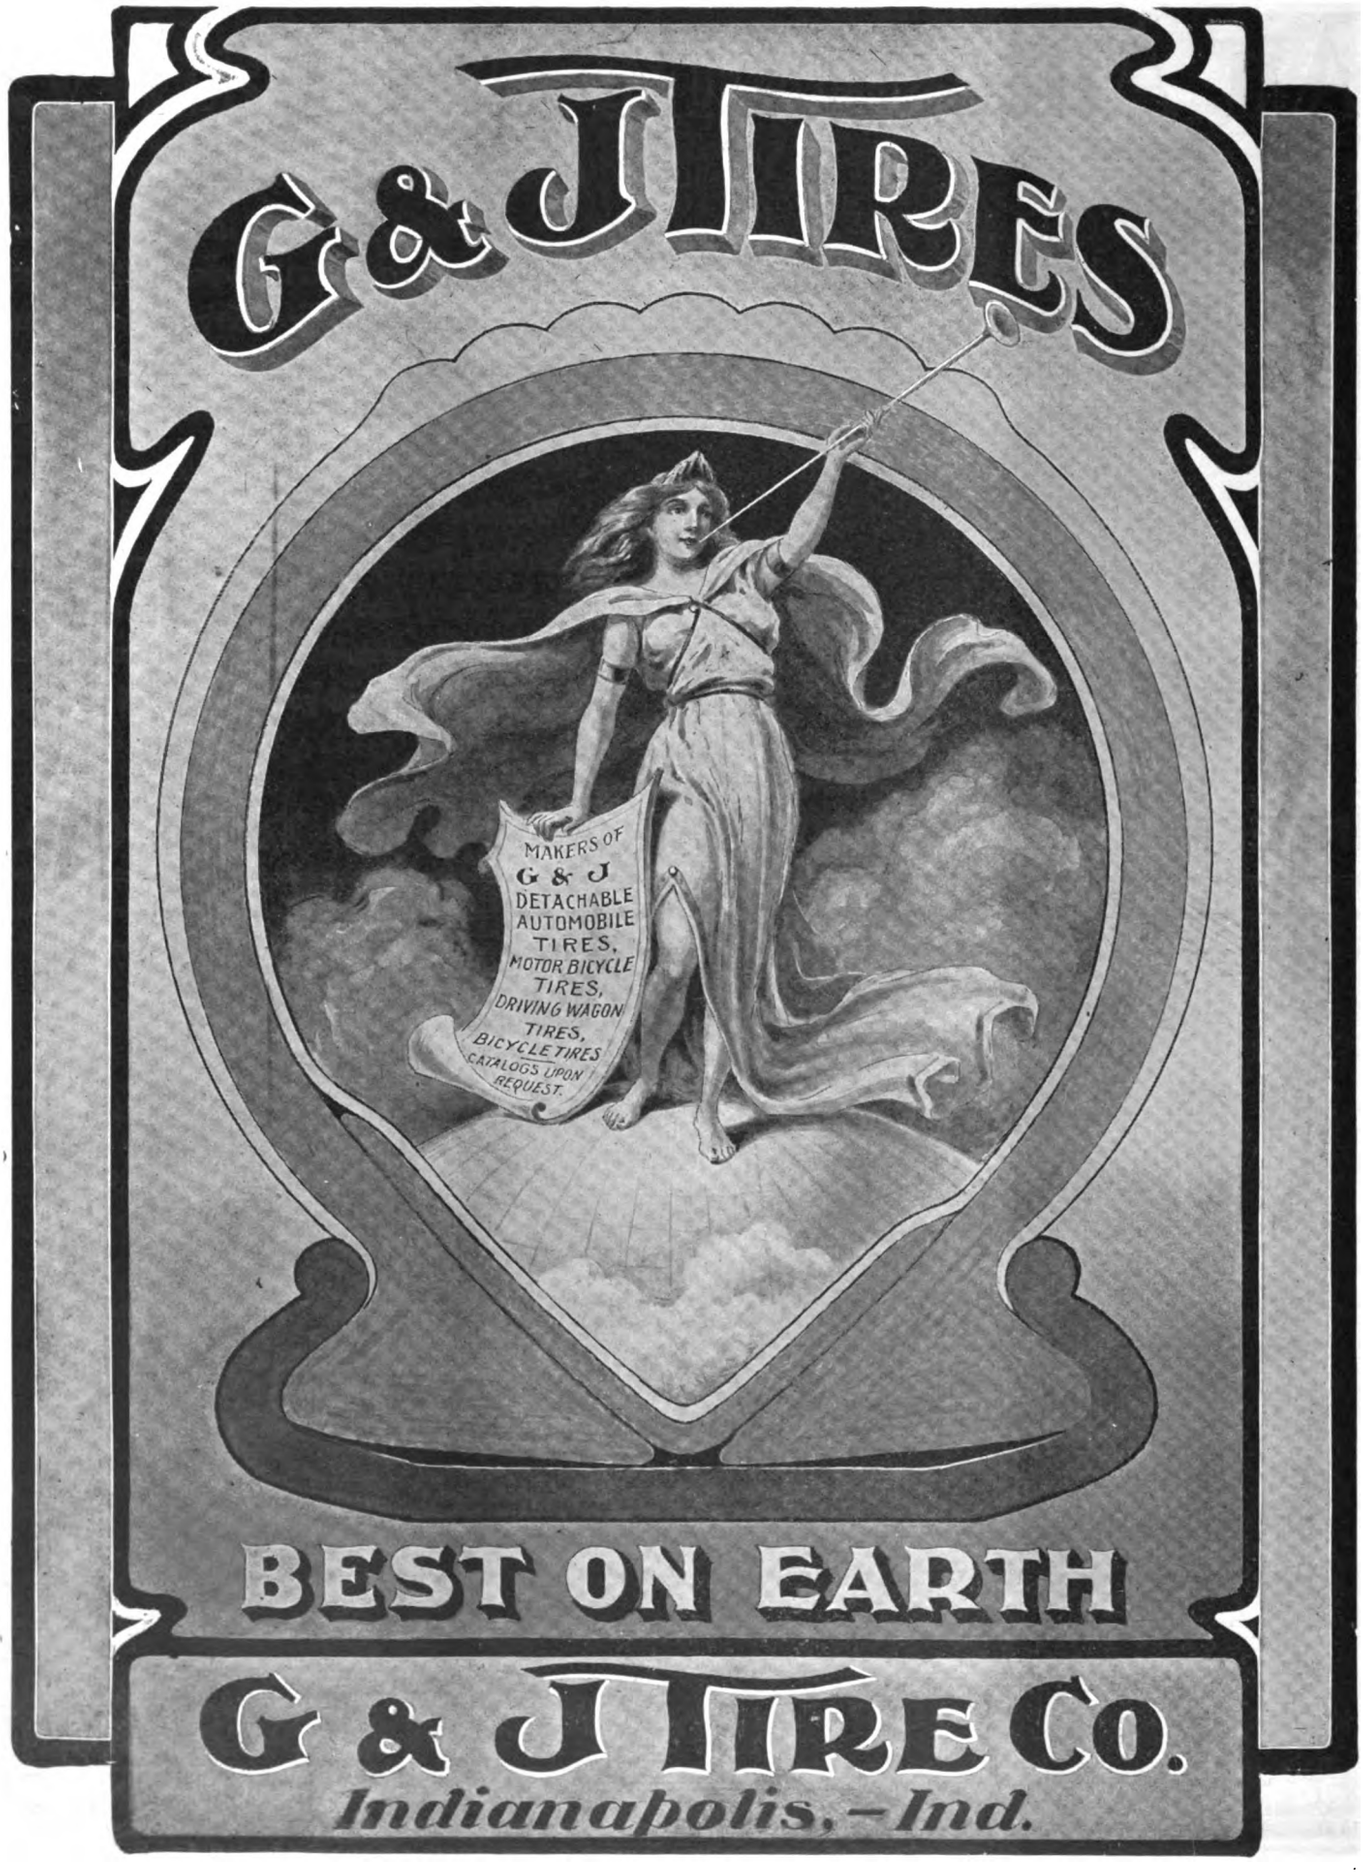
THE 12 Brake Horsepower Touring Car, as illustrated, seats five people. Runs 125 miles on one charge; has three speeds – six, fourteen and thirty miles per hour. Very simple and easy to operate. There isn't an automobile made in the world equal to this vehicle at anything like the price.

We also build 18 and 24 horsepower 3 and 4 cylinder cars. Don't take our word for it—investigate. We will gladly send complete catalogue, automobile literature, answer carefully any questions you wish to propound and send you the name of our agent nearest you.

INTERNATIONAL MOTOR CAR CO., 3065 CENTRAL AVENUE, **Toledo, Ohio.**

THE STEARNS CAR

Received a lot of very favorable comments at the show.



The style and general design is right. The motor is powerful, with a perfect throttle, and runs silently and with no vibration. The attachments on the dash and controls at the wheel are good points, too. The small tube radiator is ahead of the time, and considering all things, **STEARNS CARS are worth more than they cost.**

An Open Letter to Automobile Dealers

You are in the business to make money. Your profits depend upon Automobiles sold by you in your territory. Why confine your selling efforts to any one kind of power? All powers have their advantages. The Electric embodies many features of practical worth with a minimum of trouble. **NATIONAL ELECTRICS** represent that which is the best in the Electric field. To add our line, you are only showing good business judgment. Electrics are going to sell. Why spend your time talking other powers when a customer wants a **NATIONAL?** The National agency will prove to be a most valuable asset and money maker. Think it over and write us about our prices, terms and catalogues

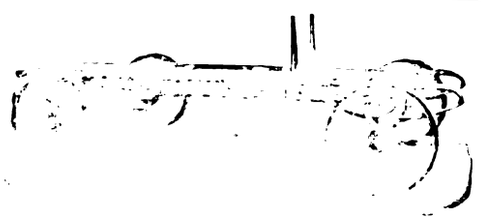
National Motor Vehicle Co., 1400 East 22d Street, INDIANAPOLIS, INDIANA.

WYOMA GASOLENE MOTOR
Single Cylinder, 8 H. P., 135 pounds.
Double Cylinder, 14 H. P. 205 pounds.

RELAY MOTOR CAR CO.,

Tenth and Exeter Sts., Reading, Pa.

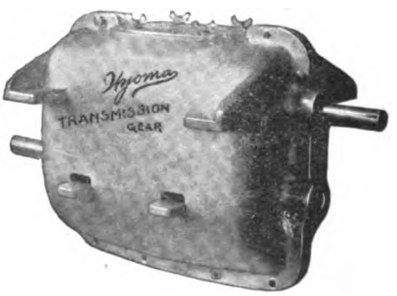
MANUFACTURERS OF



GASOLENE MOTORS, DIFFERENTIAL SPUR GEARS, TRANSMISSION GEARS, TUBULAR RUNNING GEARS, RADIATING COILS, MUFFLERS, ALUMINUM AND BRASS HOODS, WOOD AND WIRE WHEELS, CARBURETERS.

Our Motors are of French Type, Water Cooled, And Equal in Finish and Service to Best Foreign Makes.

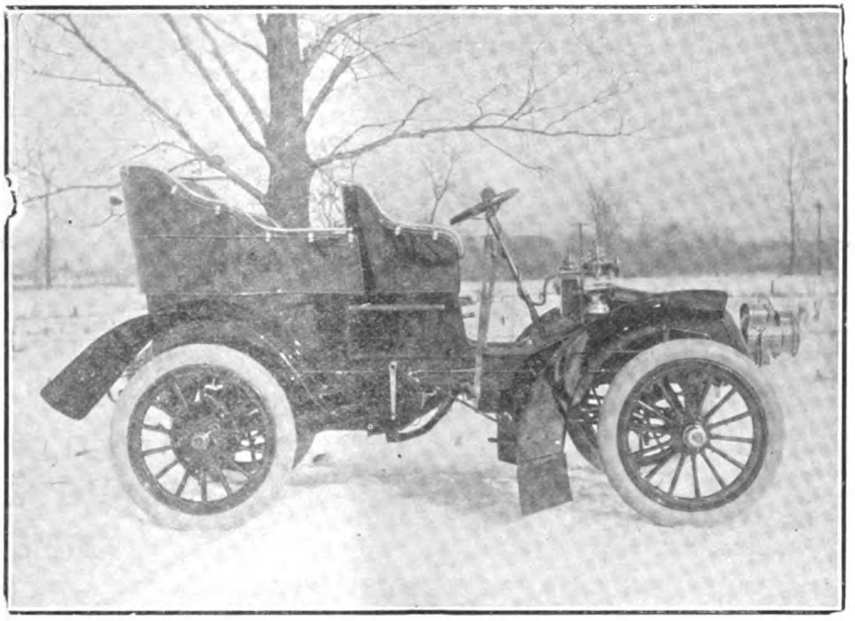
WYOMA DIFFERENTIAL SPUR GEAR
8 pitch, — 60 teeth.



The Differential Gear has Manganese Bronze Bevel Gear. fitted for either 1¼, 1⅜, or 1½ inch axles. Is made for Direct Drive, Rod Transmission, and also with chain Sprocket.

TUBULAR RUNNING GEAR FOR TONNEAUS
80-inch Wheel Base. 54-inch Tread.

The Transmission Gear is built on a new system. No Bevel Gears. Gears always in Mesh. Ball Thrust at each end of Shaft. Enclosed in Aluminum Case. Will transmit up to 20 H. P.



We make a Tubular Running Gear for Tonneaus that is a marvel of workmanship, finish and construction. All material is of the best and the Bearings are extra heavy. The Differential on this is fitted for either Sprocket or Bevel Gear.

WYOMA TRANSMISSION GEAR
3 Speeds forward and 1 Reverse.

The PACKARD

ONE OWNER'S OPINION

YOU certainly deserve great credit in furnishing the public with such a well built, reliable machine, and I trust you will be treated by the public as you have seemingly endeavored to treat them in selling them a machine that is every bit that it is represented to be. Had there never been any other than a Packard Automobile placed upon the market, I am certain we would not be called upon to endure the small boy's cry, "Git a hoss." When I hear which I am inclined to think, "Get a Packard" and have joy, pleasure and happiness, long rides and many of them, small repair bills and annoyances, and few of them."

"ASK THE MAN WHO OWNS ONE."

Seats Five People. **$2500.**

The Oldsmobile

THE BEST THING ON WHEELS.

PRICE, $650.00.

The pioneer runabout of the world and the only machine which can show such a record of use as evidenced by this letter. The OLDSMOBILE is built to run and does it.

BOUGHT ONE OF THE FIRST OLDSMOBILES MADE.

OLDS MOTOR WORKS, Detroit, Mich.

Gentlemen:—Please quote me price on Dos-a-Dos seat for my Oldsmobile. I feel pleased to express satisfaction with my Olds carriage. As you probably remember, I bought the first Olds carriage sold in Detroit. I have just completed a short trip in Canada of about four hundred miles, this being the third trip of the kind in one year, and in that same time my repair bills have not amounted to $10.00, and my carriage is still in perfect running order.

Awaiting your reply in reference to seat, I am,

Respectfully yours, P. DILLON.

MAKING A MERCEDES MYSTERY

American Incorporation Suggests big Things but Mum is the Word—Daimler Rights Infringed?

Whoever are the parties behind the Mercedes Co. of New York, which was incorporated at Albany last week with a capital of $2,700,000, they appear suspiciously anxious to remain in the background and enwrap their plans and purposes in mystery.

The directors, as disclosed by the incorporation papers, are Edward Bernhard, Philip Ahrens, C. B. Wynkoop and James Arnold, of New York City; Philip Huetwohl, of Brooklyn; S. B. Smith, of Plainfield, N. J., and Theophilus Parsons, of Hempstead, N. Y. Strangely enough the names of none of these appears in the New York directory; the only locatable incorporator is Theophilus Parsons, of Hempstead, who is connected with the law firm of Taylor, Anderson & Seymour, 35 Wall street. Mr. Parsons, however, is absolutely mum, and repeatedly referred The Motor World representative to Mr. Anderson. The latter was equally noncommunicative. The desire to dodge questioning and to withhold all information was strikingly apparent. Mr. Parsons referred The Motor World man to Mr. Anderson, while the latter in turn stated that his partner, Mr. Taylor, had the Mercedes matter in charge and he was, unfortunately, out of town. He (Mr. Anderson) knew nothing about it and declined to be interviewed or to confirm or deny certain reports bearing on the project with which his firm is identified. These reports were to the effect that Messrs. Harry Payne Whitney, James B. ("Diamond Jim") Brady, and Kessler & Co., the bankers, are the real parties behind the new company. All of those named are out of town or inaccessible.

The Daimler Mfg. Co., of Long Island City, who are understood to own the rights to all the Mercedes patents, and also the name "Mercedes," state that they are in absolute ignorance of the whys and wherefores of the Mercedes Co. of New York. They maintain, however, that the right to the name of the Mercedes is theirs, and that as soon as they are able to locate the responsible parties of the New York incorporation they will, in all probability, make themselves heard in no uncertain fashion.

Reappearance of the Pope.

The Pope Mfg. Co., which was the pioneer bicycle and one of the earliest automobile manufacturing concerns of this country, making Columbia cycles and cars, was incorporated last week at Trenton, N. J. The capital stock was given at $22,500, of which $2,500 is 6 per cent cumulative first preferred, $10,000 5 per cent non-cumulative second preferred until February 1, 1905, and $10,000 common.

The original Pope company was a Maine corporation. It was absorbed by the American Bicycle Co. when the latter was formed in 1899. The present incorporation has occasioned no little speculation, especially as the time is almost at hand when the assets of the American Bicycle Co., including not only its bicycle factories, but those of the International Motor Car Co. as well, are to be offered for sale in furtherance of the pending reorganization plan.

When this sale takes place it is not unlikely that the new Pope company will bid in the property and operate it as the parent concern.

Kirkpatrick Goes With Peerless.

After exactly ten years' joint service with the Hartford Rubber Works Co. and the American Dunlop Tire Co., W. H. Kirkpatrick will hereafter devote himself to the sale of automobiles instead of tires. He assumes the position of general sales and advertising manager with the Peerless Motor Car Co. In the prosecution of his new duties he will make his headquarters at Cleveland.

Few men have a more extensive acquaintance in the trade than Kirkpatrick. In the last decade he has become so identified with Dunlop tires that the two names are almost synonymous. The Hartford company's loss is the gain of the Cleveland concern.

WILL BUILD MOTOR WAGONS

Searchmont Directors Vote to Engage Largely in That Field—Officers Also Elected.

With an eye keen to the future, the Searchmont Automobile Co., Philadelphia, at its annual meeting on Thursday last, was definitely committed to the commercial vehicle, not in a mincing fashion, but in a wholehearted way.

For more than a year the Searchmont people have had a Panhard delivery in use, and they now have two deliveries in actual service, with which they do all their own hauling. They have done this in order to find out what is required in a satisfactory delivery car, and, believing that they now know, they purpose engaging in the manufacture on an extensive scale. The designing department has already done considerable work along this line, and the company expect to have gasolene delivery cars ready for the market in quantities next fall, although it will be a few months before they are ready to make public their plans or to quote prices. The new department will not, of course, in any way interfere with or curtail the production of Searchmont pleasure cars.

At the same meeting at which this decision was reached the following officers and directors were elected for the ensuing year: President, G. Blum; vice-president, Wade Chance; secretary and treasurer, Barclay H. Warburton; general manager, W. D. Gash; directors, G. Blum, Barclay H. Warburton, Spencer Trask, E. R. L. Gould, E. W. Robinson, Acosta Nichols, W. D. Gash, J. S. Bunting and Wade Chance.

Apple Assigns his Patents.

Three patents granted to Vincent G. Apple have been assigned by him to the Dayton Electrical Mfg. Co., Dayton, Ohio, who will manufacture and market the inventions. They are Nos. 720,550, 720,652 and 720,653, all issued on February 17 last. The first is for an electric circuit and polarity indicator, the second for a speed regulator and the third for an improved storage battery.

ROAD RULES HELD UP

Eno-Canton Ordinance Again Called up and Action is Again Postponed.

Hopes of automobilists and other road users, who have been seeking ever since the creation of the Greater New York to have a set of sensible traffic ordinances for the city passed, were rudely shattered on last Friday, when they attended what it was thought would be the last public hearing on the "rules of the road" ordinance.

More than a year has elapsed since Alderman Joseph Oatman introduced the first set of rules of the road. There have been a dozen hearings on them, and they have been modified in all sorts of ways. Finally an agreement of compromise was reached on the main question at issue, that of speed, and it was thought that all would be smooth sailing. Then William C. Eno, with the help of Borough President Cantor, introduced a complete new set of rules. These were taken with other suggestions and an amended ordinance framed that it was thought would suit everybody.

When the hearing was called before the law committee of the Board of Aldermen, President Shattuck, of the Automobile Club, said that the ordinance was satisfactory, though he thought it would be improved if all vehicles were prohibited from stopping along the curb on Broadway during the busy hours of the day. The cyclists and the Committee of Fifty were satisfied with the speed limits of eight miles in the busy streets and fifteen miles in the suburbs.

Josiah Pumpelly caused a hitch by introducing the question of hitching horses and after that Borough President Cantor, the champion of the Eno ordinance, proposed that the hearing be postponed for a week in order that everyone might have a chance to study the amended measure and propose changes. This was agreed upon and so the end is not yet in sight.

Syracuse Still Wants State Association.

The project to form a New York State league of automobile clubs is once more afoot, and is to be pushed with vigor. As before, the Automobile Club of Syracuse is the prime mover, and it will not be its fault if the scheme comes to naught. It is arranging to call an early meeting at Syracuse for the purpose of effecting an organization.

At a meeting of the club on Friday last Secretary F. H. Elliott brought up the matter, and secured the appopintment of a committee to bring it to a head. President Wilkin appointed H. W. Smith, W. L. Brown and F. H. Elliott as the committee. Letters will be sent to the clubs at Buffalo, Rochester, Utica, Auburn, Herkimer, Oneida and Albany asking them to send delegates to the meeting which will be held shortly for the purpose of perfecting the organization.

It is believed by the Syracusans that an organization of this kind can do much to influence legislation at Albany, as well as to further the cause of good roads. The need of concerted action on both these points, but especially the former, is urgent, and the more intimate and friendly relations that are certain ta result from the formation of an association are looked upon as highly desirable.

Already H. W. Smith, of the Syracuse club, is being urged as just the man to serve as president of the proposed association and guide it to success. Accordingly he will be boomed ior the office, with the formal indorsement of the club.

Tug for Vanderbilt Patronage.

Bearing upon the dealings between garages and chauffeurs, an amusing incident occurred in New York recently. While W. K. Vanderbilt, Jr., was in California his chauffeur removed his motor cars from the place where he stored them all last year to another storage station. Mr. Vanderbilt returned last week and ordered the vehicles taken back to the garage where they were before. The manager of the place where they were for a short time was asked how he liked the deal. He replied, "I'll have them back again." The proceeding suggested object, competition, inducement.

May Build in Boston.

Although now in the possession of what is probably the finest automobile clubhouse in the country, the Massachusetts Automobile Club is not satisfied. A project is on foot to erect a building to replace the present quarters, the cost being placed at $280,000. A site near the present one, i. e., on Boylestonst., near the Fenway, is in view. The proposed structure will accommodate 125 automobiles, while the basement will contain a machine shop and an emergency garage. The two upper stories will be used as clubrooms and will contain many novel features.

Export Year Starts Well.

Automobile exports started the new year with a great, big gain. During January $114,374 worth of motor vehicles and parts were sent abroad, as against a beggarly $27,311 for the preceding January. For the seven months of the fiscal year, too, a splendid increase took place. For the seven months ending January 31, 1903, $602,999 worth of goods were shipped to foreign countries, as against only $394,682 for the corresponding period of the previous year.

Cadets at This Show.

One of the features of the Washington, D. C., automobile show, which opens on March 23, in the Light Infantry Armory, is the automobile battery of the Northwestern Military Institute. The cadets will bring one of their military automobiles equipped with rapid fire gun, and also one of their automobile bicycles. They will set up a camp outfit and give exhibition drills with those new implements of war.

A. A. A. OPENS THE DOOR

Decides to Become Truly American and Welcome Individuals as Well as Clubs.

As was foreshadowed at the preceding meeting, the American Automobile Association has practically decided to admit individuals to membership. Incidentally, it is holding forth an olive branch to the American Motor League, looking to the consolidation of the two organizations.

The matter was brought up at the monthly directors' meeting of the A. A. A., held at the A. C. A. clubhouse on Tuesday afternoon. Dr. J. A. Chase, of the Rhode Island Automobile Club, presided The other directors present were W. E. Scarritt, of the A. C. A.; W. J Stewart, of the New Jersey Automobile Club; Dr. W. C. Millbank, of the Albany Automobile Club, and F. C. Lewin, of the Philadelphia Automobile Club.

Secretary Butler reported on the changes that would have to be made in the constitution and bylaws to legalize the admission of individuals. After some talk, during which it was made plain that there was no opposition to the change, this committee was appointed to make the necessary alterations: Messrs. Scarritt, Stewart and Butler. It was stated that inquiries had been received from Arkansas, Maine and Kentucky asking for information regarding the matter.

To Secretary Butler was deputed the task of conferring with the representatives of the American Motor League to see if an amalgamation or combination scheme could not be decided upon.

Two applications for sanctions for race meets were received. One was from the Automobile Club of Syracuse asking for a date in September, the other from the Massachusetts Automobile Club desiring a May date for a meet at the Readville track.

Owing to the absence of A. R. Pardington, of the Long Island Automobile Club, no action was taken on the new racing rules.

'Frisco Wants a Show.

The Automobile Dealers' Association of San Francisco is seeking support for a show to be held in the Mechanics' Pavilion. A chart showing the spaces has been prepared, and a solicitor sent out among the automobile manufacturers and agents and the cycle and sporting goods dealers to ascertain just what space each proposing exhibitor will take. The automobile dealers are agreed that a show is just what is wanted and would do more to create business than anything else.

For the Florida Races.

Three Peerless racing cars of 80 horsepower each, with engines capable of being run up to 1,500 revolutions, are being built at Cleveland. C. G. Wridgway, of New York, expects to drive one of them in races on tracks and perhaps on the Ormond-Daytona beach, at Florida.

THE CHAUFFEUR; A PROBLEM OF THE DAY

Its Far-Reaching Importance Induces Both the Automobile Club of America and the Manufacturers Association to Attempt its Solution—Schools and Licenses Suggested—Some Surprising Tricks of the Chauffeurs' Trade and how They are Played—Opinions From all Parties Concerned, the Chauffeur Included.

Improvement of the chauffeur's unhappy lot, or happy lot, as the case may be, is a subject that is assuming proportions of much moment. Shall there be an automobile board of trade to regulate the dealings between the garages and the chauffeurs and to stamp out of existence the practice of paying commissions on sales, on storage bills and on all repairs; or shall a board of trade be organized and the practice recognized and the commissions to be paid cut to a minimum and made uniform?

Shall the various storage and repair stations and sales depots take out license certificates from the Automobile Club of America, under an agreement that the garages doing this shall pay no commissions and that club members shall not patronize any unlicensed station?

Shall there be a school of instruction for chauffeurs organized by the Automobile Club and also by the National Association of Automobile Manufacturers, or shall they combine in conducting a single school, with a system of issuing certificates of graduation and competency and run an employment agency as an adjunct?

Shall the chauffeurs, organized as an industrial union, make a stand for the perpetuation and recognition of the commission practice and fix upon a schedule of percentages and wages?

When the far reaching significance of the above question is considered, it is important news to know that all these moves are being seriously considered.

The chauffeur question is becoming a serious one; indeed, it is already serious, and it is one that presents many phases. The spirit of disquietude is abroad. There is a belief extant that the whole lot of chauffeurs need improving also that a whole lot more of them are needed who have a lot more of ability. There is another belief that a lot of reform is needed in the operations of some garages and supply stations, where bills are large and the men are "flush" with "scale" money.

DIFFERING OPINIONS.

Opinions differ considerably among those in the trade as to the practicability of organizing and conducting a school that will turn out men competent to run and keep in order all sorts of cars, and also as to the possibility of stamping out the "scale" system. It is generally agreed that if anything is to be done with respect to stopping the payment of "scale," as fees and commissions are called by the men, it must be done at once or the system will have taken root too deeply to be destroyed. Some are inclined to believe that even now it will be impossible to root up the custom. The reason given for this opinion are (1) that under a board of trade, or any other co-operative plan, all the tradesmen would not act in good faith and concertedly in an effort to stop the abuse, but that some would seek surreptitiously to gain an advantage in patronage by paying commissions even while under pledge not to do so; (2) that the opportunities of the chauffeurs to "queer" business are so great that they could by opposition seriously disturb the relations between buyers and sellers; (3) that some of the employers recognize the system and are not only willing that their men shall take commissions, but insist upon their getting them. It is these considerations that make the matter a serious one, and the solution of the situation very problematical.

A representative of the Motor World has been quietly investigating the situation concerning these matters, with the sole view of ascertaining how serious it is, what its phases are, what the sentiment is regarding it, and what can be done about it. The result has been only that of bringing out very plainly the fact that there are conditions to be confronted that demand something more practical than theories for their treatment. So far as has been gone, no conclusion can be reached relative to the extent of the commission practice, or how pernicious it it, or how it can be eliminated, or even if this is desirable and possible.

A SCHOOL FOR CHAUFFEURS.

In the course of the investigation it was learned that some important activities are being contemplated, as has been indicated, by the Automobile Club, the National Association of Autotmobile Manufacturers, by the retail dealers and storage men, and by the chauffeurs themselves, although the news of these doings has been kept secret. The Automobile Club governors have decided to appoint a committee to devise a plan for stopping the payment of commissions, and the feasibility of some kind of schooling and standard of examination for chauffeurs has been discussed and is being seriously considered. The N. A. A. M. also has under consideration a plan for having chauffeurs pass examinations and get certificates. Several dealers are in favor of a local organization for self-protective purposes. The chauffeurs have held meetings and effected a temporary organization, which is to have the character of a trade union and be avowedly for the purpose of keeping up the standard of wages.

While the matter of paying commissions to men has been made prominent here, it is not by any means the only question with regard to chauffeurs and owners that commands attention. How many establishments are paying commissions on storage and repair bills to the chauffeurs of private cars it is impossible to say. Sufficient is it that a few very prominent stations are doing it. Although all of them will deny it to customers and generally, four places where business is brisk were found at which the managers admitted that they followed this custom, and all of them except one said they would be glad to get away from the practice if possible. The excepted one seemed to accept the custom as one that cannot be dispensed with, and remarked that the less said about it the better. The whole inquiry of the Motor World man brought out details that do not favor this sentiment of saying nothing about it. Some concerns are suffering because they won't, and others because they do recognize it. There seems nothing to be gained by refraining from open discussion of it, but the possibility of much to be gained by bringing the subject into the open and viewing all sides of it. Said one man who steadfastly has refused to yield in any respect to demands for commissions:

HIS BUSINESS INJURED.

"There is something to be said on both sides of the question, I imagine. We do not pay a cent to any man who operates a car for a private owner and stores with us; but I know that we are losing business all the time by not doing so. We lose business by chauffeurs preventing their employers from storing their cars here, and we lose it after getting cars in by having the chauffeur influence the owner to take them away.

"Why can't we prevent this by appealing to the owners and telling them that the chauffeur wants to move because we do not fee him? That is not so easy as you imagine. These chauffeurs are important factors. They are more important than coach-

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, MARCH 12, 1903.

The Chauffeur Question.

The problem presented in the relations between chauffeurs, their employers, the dealers and the storage men is set forth in all its phases in another part of this issue. It is the first time that this matter has been thoroughly aired. The conditions revealed by the story have existed for some time and the trade has not been ignorant of them. The Motor World is the first publication having the enterprise to investigate the matter thoroughly and the courage to print the facts of the situation. It is done now because the plot has been growing thicker and the question of how to deal with the conditions has become a live and palpitating issue of the moment. It were better some times that such matters should not be aired, but the time has arrived when this one could no longer be ignored. The Automobile Club has taken it under consideration and has been contemplating action that, if taken, would unavoidably lead to publicity. Learning this The Motor World has spoken.

In the situation as presented, even those who thought they knew something of the tricks of the trade will find new points. An effort has been made to set forth the whole impartially, showing the arguments that make for and against the system of paying commissions. The names of the persons interviewed have been withheld for reasons that are obvious. In places the circumstances of the person speaking have been slightly modified to prevent identification by those who like to make shrewd guesses, but the accuracy of the conditions pictured has been preserved inviolate. Though the clues that may seem to indicate the identity of the speaker have been purposely made misleading, the men interviewed were all of the highest standing in the trade, and dealers of wide experience.

There are several pieces of news in the article that are of peculiar interest, such as those that the Automobile Club has referred the subject to a committee and that the Manufacturers' Association is considering the issuance of chauffeur's certificates. The remarks of the different men of experience furnish much food for cogitation. After reading all the different sides presented it becomes a question whether the Automobile Club, which has but recently resented the interference of the manufacturers with its plans, should attempt to do anything toward regulating the business of the dealers. If it is said that it should do so for the protection of its members, the answer is that its members are men who should be capable of taking care of themselves in business transactions, without being imposed upon for the want of any guardianship by the club. It is but a step beyond helping members to transact the business of storing their cars to helping them in the purchase of them, and but a step beyond that to the regulation of the affairs of the manufacturers. If the dealers want their affairs regulated they should be able to organize and attend to the regulation themselves. Evils undoubtedly exist, but it is a question if interference from the outside can help matters.

The statement of the man who says that all such matters will eventually adjust themselves according to trade conditions, is a wise one. No business man wil continue to pay tribute if it does not help his business. If he can gain trade by paying commissions to whatever sort of agents he will do it in spite of ethics. Sentiment is not his guide, but commercial sense is. If a dealer chooses to pay 50 per cent commission, or to store cars free because he thinks it will help his business, that probably is entirely his own affair. The law of competition will prevent him from imposing exorbitant rates upon customers. Department stores often sell goods at cost for advertising purposes. Why not?

The suggestion of the great increase in the demand for chauffeurs that is certain to follow the sales of thousands of touring cars is one that "must give us pause." There is no visible supply.

The idea of having a school is an excellent one if it is practicable. Such an institution would need to be very efficient and to be that it would be expensive. The suggestion of the chauffeur, to put the pupils out as extra men without pay in different shops, seems to be a good one if it is feasible. They would need careful supervision by instructors from the school, and even then they would be apt to be more nuisance than help to the men managing the shops. However, by the patching together of different ideas, the manufacturers, and they are the ones with the most at stake, some plan of instruction that will not involve a prohibitive expenditure may be worked out.

If men of ability and of good character can be supplied the other phases of the chauffeur problem are apt to be solved, as are the problems of transmission gearing, by the test of practicability in operation.

Flaws in Revised Road Rules.

Now that the "rules of the road" ordinance has been put back a week for consideration of its provisions, it is well to mention one feature of it that seems particularly absurd, even stultifying.

This is to be found in Article VI, Section 1, on lights. Here it is stipulated in substance that every vehicle shall carry a light in front at night, and that automobiles shall carry a red light behind. It is not required of other vehicles that they shall carry rear lights.

The nonsense of this is so obvious that one is at a loss to understand how it has passed muster thus far. The ordinance has been read and no objection has been made to this phase of it.

If any class of vehicles is to be exempted from carrying rear lights it should be automobiles. The attempts at regulation of them are inspired because they go fast—faster than horse drawn vehicles. The danger from au-

Digitized by Google

tomobiles is generally supposed to be to those in front of them and not to those behind.

This being so, it is plain that the horse drawn vehicles are the ones that should have rear lights. The automobile overtakes the horse drawn vehicle going in the same direction more often than the reverse occurs. There is danger of an automobile running down a farmer's wagon or other vehicle on a country road at night when it has no light. There is very little danger of a vehicle drawn by a horse running into an automobile, even if the motor car has no rear light and the road is dark. In the first place, the horse is not apt to overtake the motor car and if he does the animal's instict and sense of smell will prevent a collision.

At the Automobile Club very recently, two members testified that the greatest danger on the road in their experience had been that of running into the rear of a vehicle going in the same direction at night on a country road.

It seems to be very plain that for the protection of all the law should compel horse drawn vehicles to carry lights at the rear, whether automobiles do or not. The best revision of the law would make it read so that all vehicles except bicycles should carry rear lights. There is no way in which a bicycle can conveniently carry a rear light, and the narrowness of the vehicle makes it possible for it to carry a front light so that the side glare of it can be seen from behind.

There is to be another hearing on the ordinance to-morrow, Friday, and this matter should be brought up then.

Another point of lesser importance, though it might be the cause of legal controversy, is worthy of attention. The use of the word "restive" relating to horse in the same section of the bill is wholly unnecessary. It might make a pretty legal squabble to prove whether or not a horse was restive. If an automobilist saw a horse quiescent and showing no sign of fear of restlessness, he might justifiably refuse to recognize the arbitrary holding up of a hand by the driver as a signal for him to stop and go on. The horse might run away. The automobilist might be able to prove positively that the horse was not restive when his driver gave the signal, and so under the law he was not obliged to stop. The driver of the horse might then prove that the horse had been known for years over all the countryside as a restive animal. In the original Scovel bill that was introduced in the New Jersey Legislature the word restive was used in a similar clause, and it very sensibly was stricken out when the bill was revised and the Williams bill introduced. It should be stricken from this ordinance.

The whole section relative to automobilists stopping when a horse driver holds up his hand is a bid for mischief anyway. It is well intended, but motorphobes could have a lot of fun bullying automobilists under the cloak of this law.

Honeycomb Coolers.

Cooling systems are such an important part of all high-powered gasolene cars that it was inevitable that sooner or later they would come in for a larger share of attention. And this in spite of the fact that hot water, even to the point of boiling, in the jacket is conducive to engine efficiency.

The honeycomb radiator is the outcome of this increased attention. Just how much of its present vogue is due to its having originated with the makers of the Mercedes car is problematical. But it is reasonable to suppose that it is considerable. At the same time its undeniable merit has also been a potent factor. Did it not deserve some at least of the encomiums bestowed upon it, its popularity would not have been as well assured as it is.

The fact is now frequently lost sight of that the chief claim made for the honeycomb cooler, when it was brought out a couple of years ago, was the saving in water rendered possible by its use.

In other words, it was not so much that it cooled the water more effectually, as that this cooling resulted in a much smaller consumption of the precious fluid. This economy possessed a twofold advantage: It reduced weight and bulk—smaller tanks and less water being permitted—and it obviated more or less frequent filling of tanks. This meant a saving of labor even when there was a plentiful supply of water; and when there was not there was no need to worry about it. What a difference this meant will be appreciated when the original claim of the Mercedes people is recalled, viz., that a day's run could be made on a consumption of only three pints of water.

It will scarcely be denied that the principle of the honeycomb cooler is a thoroughly good one. The minute divisions of the water, with currents of air surrounding them, cannot but cool the water rapidly and greatly lessen its evapodation. As this is the object of all radiating systems, it is obvious that the one which does it most expeditiously and effectively possesses features that preclude the possibility of its being overlooked. That is exactly the position of the honeycomb radiator.

There are some features usually employed in connection with it that are not so readily commendable.

One of these is the use of a fan for inducing a current of air through the cells of the comb. As generally placed—just back of the radiator—it is an open question whether it is of much real service. The speed of the vehicle and the position of the radiator ensure the passage of a large amount of swiftly moving air through the orifices; and we cannot help feeling considerable scepticism as to the inducing qualities of such an artificial device as a fan, no matter how swiftly it may revolve, a scepticism that not even the general adoption of the fan by European designers can dispel.

As to the practice of the Cannstadt firm in fitting the 1903 Mercedes with a flywheel in the form of a fan, it must be viewed with even more suspicion. How it can play any great part in inducing air through the radiator, situated as it is several feet away from it, and with four cylinders interposed as a barrier between, passes comprehension.

At any rate it is a refinement that has as yet failed to appeal to many makers.

An Advantage Overlooked.

So much stress has been laid on the most patent feature of the new type of steam car, i. e., its following the gasolene lines, that other and even more cogent reasons for its adoption have been overlooked.

It is even more important that the operator of a steam car should have all the appliances needing watching in front of him than in the case of the gasolene car operator. The former has to give more attention to them than the latter. He must frequently consult his water gauge, his steam and pressure gauges, to watch his burner, etc. With these in front of him his attention is never taken entirely off the road.

With the boiler and the engine, together with their attendant appliances grouped in front, the natural, the accustomed, method of disposal is followed. The locomotive engineer finds such arrangement indispensable. The motor vehicle operator finds equal advantage in it, and does not fail to express his satisfaction with the new order of things.

Digitized by Google

THE CHAUFFEUR; A PROBLEM OF THE DAY

(Continued from page 905.)

men. They are a higher class of employe than the driver of a horse, and there is more to be left to their judgment. Furthermore, an automobile is a vehicle that lends itself readily to the purpose of a man when he wants to make its owner dissatisfied with the treatment is gets at the place where he stores it. There are a thousand ways in which a chauffeur can give your place and your product a black eye if he wants to. It is of little use to explain to a man. The chances are that he has previously been convinced by circumstantial evidence that what his chauffeur says against your place is true. The chauffeur manufactures the evidence, but is of a physical kind having to do with the condition of the car, and it is very convincing. Suppose, though, the man is made to understand that the chauffeur is the cause of the whole trouble, and that he, the owner, really has no cause for dissatisfaction. This makes it no better. The owner does not want a chauffeur who is grumbling all the time. He wants him satisfied. He has no time nor inclination to go into the merits of the thing. It is easier to say 'all right' when the chauffeur proposes a change of garage. A man whose time is fully occupied with either business or society affairs has to leave a great deal to his chauffeur. He wants a man to whom he can leave all the details, and he does it usually whether the man is wholly trustworthy or not.

"Those are the conditions under which we labor. The chauffeur, having so much to say, it would be surprising if he did not demand a 'rakeoff' for delivering his employer's business to a place. This is only human nature. He feels that it is right for him to have a commission, and if he don't get it he makes us feel his power.

"I am in favor of some kind of an organization of the trade with a rule under which any man caught paying a commission to a chauffeur would be mulcted a heavy fine.

SCARCITY OF CHAUFFEURS.

"This matter promises to get worse before it improves. You want to understand that there is already a scarcity of really good chauffeurs. I mean really first rate men, who are clever at steering a car and can keep it adjusted and tinker it properly. I do not know where to put my hand on such a man, and there is a demand for them. There is going to be more of a demand. Here, for instance, is a concern going to turn out 500 touring cars this year. The buyers will want men for them. Where are they coming from? The shops are not turning out enough. Each shop has usually only one or two thourough mechanics, and they are not necessarily good drivers of a car. The shops want to keep those men, and in many cases the men won't accept positions as chauffeurs even at an increased wage, for they hold it to be a menial employment. In spite of this, we have trouble here every summer trying to keep our force, because of men coming along and offering them more money to be chauffeurs. The really capable men are the ones who won't go as a rule, and so I ask where are our new expert chauffeurs to come from?"

Said another man, the head of a big establishment, who tacitly acknowledged that the commission system was practised in his place:

"I shall be very glad to see the time when I can kick the whole system out of the place. I cannot now, but I expect to see the time when things will be so that I can. There are a good many difficulties in the way of stamping out the thing.

HOW HORSEMEN DO IT.

"In the horse business, you know, this sort of thing has gone on for fifty years. Everyone knows about it, and there is no attempt to conceal it. Every horseshoer, carriage builder, feed man, harness man and even the sellers of axle grease have to 'see' the coachman. They expect to do it. With every strap and buckle bought goes the coachman's question of 'what is there in this for me?' The employers of the coachmen are acquainted with the practice and make no attempt to stop it, so what can the dealers do? Of course what the coachmen get comes out of the employers in the long run, but I know of men who know this and yet actually 'tip off' their coachmen when they have made a new purchase to go and get their commission. If the coachmen got no commission and the harness or other articles were sold to the employer less the amount of the commission, there would be trouble all around. In the first place the business rivals of the seller would be down on him for cutting prices. Then he would have an enemy in all the coachmen and his goods would break and give anything but satisfaction. He would lose the good will of his customer, of the coachmen and of his fellow dealers.

"There are signs that similar conditions are beginning to exist in the automobile business. I had a man come to me and tell me that he was going to take his machine away. That was before I was paying his man 'scale.' I asked him if everything was not satisfactory and he was evasive. I told him I suspected his chauffeur was dissatisfied because he was not getting a 'rake off.' Then he admittted that this was the reason why he was going to move. Other chaffeurs got fees in other garages, he said, and he wanted his to have all the perquisites he could get. He was a good man and he wanted to treat him right. I was amazed. I said to him: 'I suppose you appreciate the fact that when commissions are paid that they come out of your pocket in the end.' With smiling composure he replied:

OWNER FAVORS "SCALE."

"'Yes, I understand that, but I want my man to have it, because it does not save me anything if he doesn't get it and he is grouty. I mean that the rates in places that don't pay commissions are just as high as where they do.'

"Now, what are you going to do in the face of such a sentiment on the part of owners? Besides, there is something in what he said. I would join an association of dealers to stop the practice, but I doubt if it would be effective. Would the storage men on the strength of paying no commissions be willing to make a reduction in the rate of storage? Owners like the one I have quoted would expect it. He figures it out that where his man don't get it the storage house keeps it, and he has to pay the same either way. Other owners would come to the same way of thinking, and it is the way the horse owners think. On the other hand, would the dealers keep faith? Would not some of them try to steal a march on the others by paying premiums secretly to get business?

"The same trouble seems to run through every business. A friend of mine in the oil business was telling me recently how the buyer of a customer made him add to the price quoted and give him the difference. I asked him why he did not go direct to the firm of the buyer and tell them he could furnish the oil for so much less if he did not have to include a 'rake off' for the buyer. He answered: 'That would be of no use, for we have tried it in other cases. Such men, just like your chauffeurs, hang together. Even if they discharged the buyer we would lose that firm's trade. The oil would be dirty or have something the matter all the time. It would cease to give satisfaction just as soon as we made any such move. We have to stand for it, that's all.'

POWER FOR MISCHIEF.

"You have no idea how easy it is to queer the work done on automobiles. If we stopped paying commissions not a single repair job that we did would be right. The storage vehicles would be giving trouble all the time, we would be blamed and would lose our customers. I don't know how places get along that don't pay commissions. They don't have the class of customers I do, that is certain. On the other hand, by paying commissions you have something of a hold on a chauffeur whose employer 'boards' his car with you. For instance, I heard a chauffeur making a great 'kick' one day about the way his car had been washed. He had found a couple of small dirty streaks on the body after the washers had finished with it. I told him to shut up. He said we were paid to keep the car clean. I told him he, too, was getting paid at both ends and that it would be a small matter for him to take a cloth and wipe off the dirt. He did it. It is very hard to get a car perfectly cleaned. I have looked one over and seen not a mark at night by the electric light and in the morning found a big streak of dirt on it. If a man wants to be mean about such things he can do it easily and soon turn our patron against us. I would be glad to see the whole business stopped, if it can be."

Still another man, one who has a big establishment and is "on the fence" as yet,

Digitized by Google

not having decided whether to fight it out or yield, said:

THE DEAL WITH THE GARAGE.

"At present I do not pay any commissions. I do not know what I am going to do in the future, though. I think it is a most pernicious and baneful practice, and should be stamped out. I have men come to me right along and say:

" 'I like your place and would like to bring my car here. Will you pay as much as the other places do?'

"I ask how much that is, and they all strike for 10 per cent on all repairs and supplies. Some ask to have the storage bill included and be paid 10 per cent on all bills, and some do not. Then to find out just what they expect I have led them along by letting them believe for a while that I am willing to pay a commission, and this is what comes next. The chauffeur asks:

" 'Do you keep a strict account of the movements of the car?'

"At first I did not understand the question, and said so. Then the man said:

" 'I mean do you put it down every time a car goes out and when it comes in?'

"I told him that of course we did, and he said:

" 'Well, I wouldn't store in a place where a full record of the car's goings and comings is kept.'

"I asked him why he wouldn't and coaxed him into telling me, and this is what he said:

" 'Well, you see, I get $100 a month, and I can make $100 a month out of the car if no record of its movements are kept.'

"Taking out parties is what you mean, I exclaimed, a light now breaking on me.

" 'Exactly; hacking it.'

"HACKING IT."

"Hacking it, I have since learned, is the term by which the chauffeurs call the practice of hiring out their employer's car for long or short trips, the same as a public hack. Of course this is done at night, or at such other times as the chauffeur knows his employer is away, or will not call for his car. Since I first learned this I have been frequently asked the significant question of whether I keep a strict tally on the going and coming of storage cars. I understand it now. The men give me to understand that in some places only the record of the trips made by the car when the owner is using it is kept, and that the chauffeur can use it on the quiet as much as he likes without being reported.

"This is one phase of the chauffeur question that certainly calls for attention. It is a flagrant abuse and one that should be stopped if nothing else is. And it could be stopped, all of it."

The Motor World man said: "The Automobile Club has decided to appoint a committee—Ibelieve one has been appointed—to arrest these abuses. What can the club do to stop them?"

The answer was: "Why, it could issue a license to every garage and have it understood that the club members would patronize only licensed garages. The various places licensed would be under a pledge not to pay any commissions and if any of them was caught doing so, its license would be forfeited and it would become an unlicensed place, which, to all effects, would be boycotted by the club members."

"Would such a system of patronage and boycott not be conspiracy in the legal sense against the places that might choose to run their business to suit themselves without license or interference by the club?"

"I don't know."

A chauffeur, one of the best, a man who has served several years as mechanic in a large automobile establishment, who is recognized as an expert driver and who is now employed on the car of a man whose name is synonymous with millions, had this to say:

THE CHAUFFEUR'S STORY.

"I suppose all this fuss has been stirred up because one man went talking to a reporter recently—for the sake of hearing himself talk I suppose—about the demoralization of chauffeurs. Of all the people who should not talk the man who did talk is the one, for his concern, as is well known to all the trade, is the one generally credited with having introduced the system here through its imported chauffeurs. What made the boys mad was that the firm, which had been paying commissions to only some of the men in the place, had just come out voluntarily with the proposition to treat every one alike and pay five per cent commission all around. Then this man comes out with a sad story about the depraved demands of the chauffeurs and a denial that his firm pays commissions. It hurt worst, though, when he said that they had to pay premiums to get good men. This—well, all I can say is that for a long time it was a mystery to some of us why the foreigners got the pick of the jobs to be given out, but we understand now. The American chauffeur, though, has not yet come to the stage of paying a concern for recommending him for a job.

"This whole system was imported with the chauffeurs from Europe. The Americans were not 'wise' to the ins and outs of the game, but the foreigners were as wise as serpents and knew every trick and, of course, the Americans began to learn. I have associated with the foreigners in the place we have been speaking of, and incidentally the first and only commission I ever received was handed to me unsought by the very firm that has been stirring up this muss.

CLAIMS COMMISSIONS LEGITIMATE.

"You must not think, though, that every man who takes a commission is a crook. Commissions are a part of every business and there are legitimate commissions for a chauffeur to get. He need not do anything but what is for the best interests of his employers and yet get them. I was just talking with a chauffeur whose boss has ordered him to get a couple of hundred dollars' worth of fixings for his car. He has been to three places and got estimates. At every place he was told that if he brought the order there he would get a commission. He would place the order with the lowest bidder, anyhow, but as it happened the lowest bidder offered him the best commission. He will be just as particular to see that the goods are up to standard as if he got no commission, because he expects first of all to do right by his boss and keep his job.

"There are men who abuse the commission practice, just as there are men in every line who abuse their privileges. I have yet to know of a man, though, who would buy anything unnecessary in the way of supplies or repairs or who would get anything but the best bargain he could for his employer. Any man who would do so ought to be booted out of the business.

"Suppose Mr. Brown's chauffeur says to a supply man that he doesn't want any commission, does it make any difference in the price that Mr. Brown has to pay? Not a bit of it. The dealer has to pay Mr. Smith's and Mr. Jones's chauffeurs commission, and if he cut the price to Brown he would soon be in trouble with Smith and Jones for selling to Brown for less. The commission comes out of the profit of the dealer. When the chauffeur doesn't get it the dealer is that much ahead. You get an order for a man for anything from bird seed to a battleship and there is a commission in it for you.

QUESTIONS OF WAGES AND SCHOOLS.

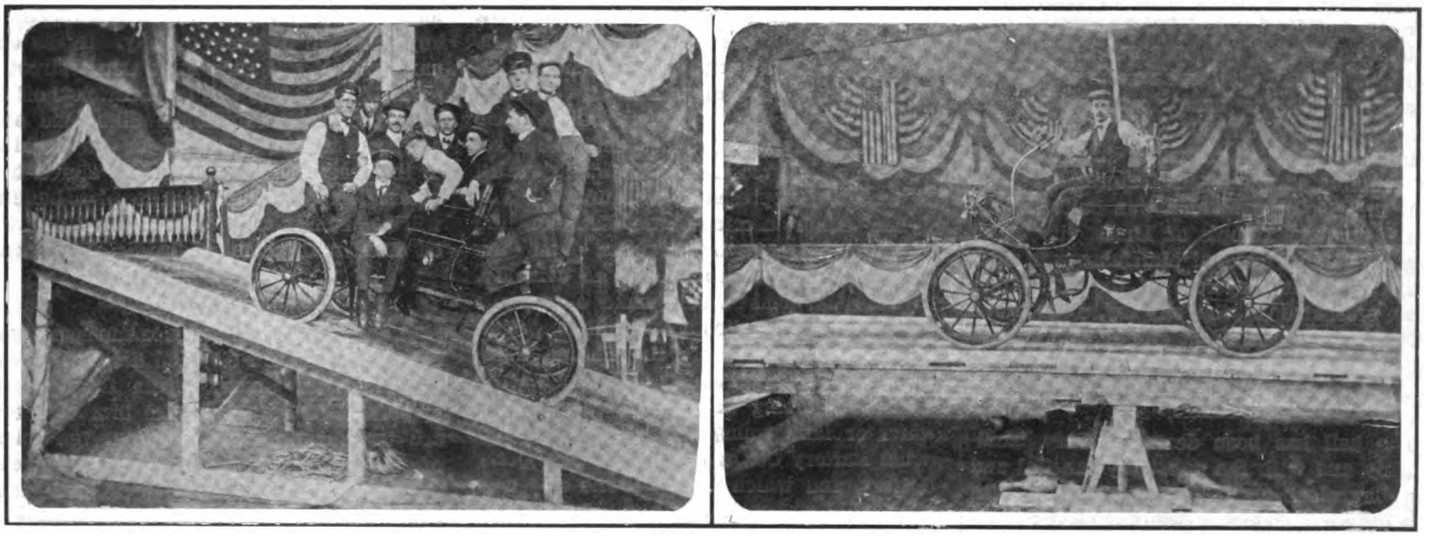
"Hacking it? Yes, that is done, but the men who do it are not the best men who get good salaries. That is something that is rank wrong and should be stopped. I don't take much stock in a chauffeur's union, but it might be of use in stoppping abuses of that sort. It could not regulate wages. They are too variable. One man is worth much more than another for the same kind of a car, and different men want different sort of services from a chauffeur.

"Good men? I don't know at this moment where there is one who is out of a job that I could really recommend as being a good driver and a good mechanic. It is to the interest of the manufacturers to have good men in charge of their cars, and they ought to start some kind of a school and break in green men. Many a car has got a black eye just because it has not been properly handled.

"The manufacturers could take a school of say six or nine men and divide them into classes of three. They could put three men each to work in the shops on cars of different types, say one class at work in the Winton place, another in the Locomobile shop and another in some place where foreign cars are handled. The men could work three or four weeks in a place and be shifted from one shop to another until they had learned enough to take hold of any type of gasolene car. They would not be experts,

Digitized by Google

but they would be better than a lot of men who are now calling themselves chauffeurs. These scholars could work without pay in the shops and learn how to manage a car on the road from going out in the demonstration cars.



"Chauffeurs are not demoralized and they are not robbers, but more good ones are needed."

A manager who believes in recognizing the system of commissions for the present, said:

"This matter should not be stirred up. Leave it alone and it wil ladjust itself. The natural laws that govern the conduct of men and the laws of competition will settle it as it should be, and nothing else can. If the nature of the business is such that it feeds the system and encourages it, it will last and no arbitrary ruling of any club or board of trade can kill it. It may be an abuse, but if it is one that is encouraged by the competitive conditions of commerce it will continue. Many bad practices are kept alive in business by competition, and you can't help it. If, on the other hand, it is an evil that is artificial, a condition that is false and unnatural, it will soon be shaken off. Business men won't be imposed upon long. Let them run their own affairs to suit themselves and this thing will work itself out to a natural adjustment. You can make a lot of fuss, but you can't stop it if it is to be, and you can't perpetuate it if the conditions don't nourish it. Let it alone."

A member of the Automobile Club, who represents a large manufacturer, said:

"There is no doubt about the existence of this evil of commission paying and it is a very great one. I know a man who is as well satisfied as a man can be by circumstantial evidence that his car was deliberately smashed by his chauffeur in order that he might get the commission on the repair job and have a little vacation while the car was in the shops.. At the show I had a man come to me who is the chauffeur of a wealthy New Yorker, and he told me that his employer was going to buy one of two cars, ours or another make. He said he could throw the sale to either one he chose, that the other firm was going to give him $500 if he picked their car and he wanted to know what I would give him. I told him nothing and his employer, sure enough, bought the other car. The getting of good chauffeurs is another problem and, indeed, the whole chauffeur question is troublesome. Some poor operators are getting more than good ones. Some men pay twice as much as others; some engage men agreeing to pay a salary and board and others do not. There is a lot of regulating to be done. It is terribly mixed up now. I hope you can make some head or tail of it; I can't."

The ever-alert Ben Smith, manager of H. B. Shattuck & Son's Boston Emporium, lost no opportunity at the "Automobile Carnival" in that city last week. He had his cars always in evidence and opened many eyes by sending a Packard up a flight of stairs built at a 25 per cent. angle, starting from a standstill and then repeating the performance from the opposite side which was a 35 per cent. grade. He also had one of his little Oldsmobiles carrying 10 people weighing 1250 pounds, climb a 25 per cent. grade, as shown by the accompanying picture. He also won a blue ribbon for the Olds by showing its splendid control on the see-saw or teeter-board.

Status of the Storage Battery.

When asked what effect the expiration of the Brush storage battery patents would have on their business, the Electric Storage Battery Co. gave out this typewritten statement:

"While the Brush patent served to build up the storage battery industry, its value in maintaining a monopoly is long since past, and the Electric Storage Battery Co. is the owner of numerous patents of far more controlling importance upon its business than the Brush patent has ever been. In fact, with the exception of the pasted plate type used solely for automobile purposes, none of the different types now manufactured by the battery company has employed the Brush invention, and all are covered by patents which still have many years to run.

"While patents are always useful in protecting an industry, the Storage Battery Co. depends upon its reputation acquired during its twenty years' experience in the storage battery business to maintain its position in the business. Then the company has other patents of controlling importance covering the essential application of batteries, and the company is now actively engaged. through its patent counsel, in pressing to final hearing such fundamental patents mainly relating to the application to which storage batteries are put. The leading patents which it is now actively litigating are the booster patents, which are the inventions of two very prominent electrical engineers of this city, Mr. C. O. Mailloux and Mr. H. Ward Leonard.

"It can easily be understood that while paster plate batteries of more or less merit may now be manufactured, they cannot be applied to any useful purpose without infringing some of the existing patents owned by the Storage Battery Co.

"The only application which is affected by the expiration of the Brush patent is what is known as the pasted plate, which has a limited use and which is also difficult to manufacture, and if the inexperienced attempt to enter the field of manufacture the way will be strewn with their wrecks."

New Garage in Providence.

Plans are now being drawn up for an automobile storage station to be erected at the corner of Mathewson and Martha streets, Providence, R. I. The structure will be a two story one, with a frontage of forty feet in Mathewson street, and will extend 100 feet back, with entrances in both streets. The office and storeroom will be in front, leaving ample room for the storage of a large number of vehicles in the rear portion of the building, which is expected to be completed by June 1. It will be in charge of Nelson S. Davis.

W. A. Richwine, of the Autocar Co., has just returned from Denver, Col. He reports that the prospect for business there is excellent.

BUFFALO SHOW OPENS

Nearly all Prominent Cars in Evidence—Big First Night Attendance.

Buffalo, March 10.—This city is holding its first Automobile Show this week, and its success is marked. Buffalo, with its 350 miles of asphalt pavement and with the good, smooth level roads of the country surrounding is an ideal place for the use of the automobile and its popularity in this city is increasing at a rapid pace. The city is also destined to become an important centre of the motor vehicle industry; indeed, already has quite a large number of manufacturers of machines which rank high among the automobile products of the United States.

The Show is being held in Convention Hall, a building owned by the city of Buffalo, and rented for purposes of this nature. The main hall, where the display of motor vehicles is made, contains a clear floor space of about 200 feet by 125, and is admirably adapted for such an exhibition. It contains as one of its features the magnificent pipe organ which was built for the Pan-American Temple of Music, the building in which President McKinley was shot. This organ at the close of the Exposition was presented to the city by a generous citizen, Alderman J. N. Adam, and placed in Convention Hall. It will be heard upon several occasions during the Automobile Show.

The hall has been decorated very handsomely and with the unusually fanciful and dazzling electric effects in connection with the different booths presents a most attractive appearance. The stage is set with Pan-American scenery showing the Electric Tower and other buildings of the City of Light, and appropriately connects the automobile exhibition with that now historic exposition. As for the show as an exhibition of automobiles it is a credit to the city of Buffalo and is said by those who have recently come from the shows at Cleveland, Philadelphia and Detroit to eclipse them in general effectiveness.

The largest space is taken by the exhibit of the W. C. Jaynes Automobile Co., of Buffalo, which shows the famous Winton touring car and the equally conspicuous, if lower priced, Oldsmobile; also the "Franklin" and several National electric vehicles.

The E. R. Thomas Motor Co. show several of their touring cars, and, of course, its well known Auto-bi motor bicycle, and as the product of one of the early workers in the vineyard, the Thomas cars and cycles are receiving the meed of attention that is their due.

A leading feature of the show is the exhibit of Packard machines by the Roe Automobile Co., of Buffalo, which includes the splendid 12 horsepower motor car, model F, 1903, which has been so much admired at other shows of the year, and the specially built Limonsine at $10,000. The Roe Co. also shows the well known Autocar and Waverley.

The Columbia Motor Vehicle Agency of Buffalo shows several handsome types of the electric automobile, the products of the Electric Vehicle Co. The Columbia agency has recently been established by a pioneer in automobilism in Buffalo, Dr. Truman J. Martin, with W. S. Bull, well known in both bicycle and automobile circles, as manager. It represents the Jones-Corbin Co. and the Ward-Leonard Electric Co., as well as the Electric Vehicle Co. The electric vehicle which Dr. Martin brought to Buffalo to astonish the natives away back in January, 1897, is still in use, and giving good service. It is known around Buffalo as "The Pioneer."

The Conrad Motor Carriage Co. and the Centaur Vehicle Co., both Buffalo concerns, have some excellent specimens of their work on exhibition. The Conrad touring cars, runabouts and delivery wagons being splendid types of up to date vehicles at twentieth century prices. The Centaur Motor Vehicle Co., besides its own product, shows the Toledo, Searchmont, Yale and Cadillac cars, all of which it represents in Buffalo. The stylish Baker Electrics, the Rambler, the Haynes-Apperson, the General and the Prescott are also prominently in evidence.

Numerous firms which make automobile accessories or supplies have exhibits, prominent among them being the Buffalo Gasolene Motor Co., which exhibits an electric launch containing motor adapted to either water or land transportation, and the National Battery Co., which makes the Sperry Battery, and which in fact is the only concern at present making electric batteries in Buffalo.

The following is a summary of the exhibits:

W. C. Jaynes Automobile Co.—Wintons and Oldsmobiles; Centaur Motor Vehicle Co., Cadillac, Toledos, Yales, Americans, Searchmonts and Centaurs; Roe Automobile Co., Bakers, Autocars, Packards and Northerns; J. J. Gibson, Haynes-Appersons; Columbia Motor Vehicle Agency, Columbias, Jones-Corbins and Knickerbockers; Don Robinson, Waverleys; Gibson Howard, Knoxes; A. J. Wells, Generals; D. H. Lewis, Ramblers; E. R. Thomas Motor Co., Buffalos; Prescott Steam Carriage Co., Prescotts; Foster Automobile Mfg. Co., Conrads; H. H. Franklin Mfg. Co., Franklins; Buffalo Electric Carriage Co.; Geneva Automobile Co., Genevas; Morlock Motor Works, gasolene runabout; Pierce Motor Car Co., Pierce Electrics; Buffalo Gasolene Motor Co., Buffalo motors; National Carbon Co., dry batteries; Fisk Rubber Co., Fisk tires; Diamond Rubber Co., Diamond tires; Twentieth Century Lamp Co., Twentieth Century Lamps; Standard Anti-Friction Equipment Co., anti-friction bearings; Hussey Automobile and Sundry Co., specialties; Truescott Boat Co., launches; Buffalo Tire and Rubber Co., tires; Schaeffer, Bunce & Co., running gears.

About four thousand were in attendance to-night and there is a prospect of increasing crowds during the week. The press of Buffalo has supported the enterprise well and the exhibition has aroused great interest, which wil doubtless aid in furthering the city's remarkable industrial boom and especially its boom as a centre of the automobile industry.

Geisel Enlarging his Station.

Extensive alterations are to be made to the automobile station of A. A. Geisel, Springfield, Mass. The plans call for an extension on the rear of the present garage of ten feet, and then another addition, 40 by 100 feet, runing to East Court street. When the new part is completed there will have been added 4,000 square feet of floor surface. The addition will be modern in every respect. There will be rooms for men and women, and a shop in which repairs of any kind can be made quickly. In the new part, which will face East Court street, a room 15 by 30 feet will be partitioned off for the Springfield Automobile Club, and storage room will be furnished for the machines of the members. These will be stored free, unless left over night. The new building will be of brick with cement floors, and will be fitted with chemical fire extinguishers.

In Use in Guadaloupe.

"A daily automobile service has been established between this city and the town of Ste. Rose," writes Consul Ayme from Guadeloupe. "This service is the first step toward the substitution throughout the colony of automobiles for the archaic stage coaches which were the only means of land transport. The Ste. Rose line began running on January 1, and has proved a success. On March 1 two new lines will be established, one from this city to Basse Terre and the other from this city to Le Moule. The automobiles used are of French manufacture, with gasolene engines as motive power. They are well made, handsome vehicles, and carry ten passengers besides the chauffeur and his assistant. The prices charges are about the same as for the old stage coaches."

Trolley Strike Makes a Sale.

One of the few gainers by the seemingly interminable Waterbury, Conn., street railway strike is S. A. Miner, the Hartford dealer. He sold a large steam bus last week to a committee of the strikers, and it was at once shipped to Waterbury. The committee is said to be looking for one or two more similar vehicles.

New Garage in Worcester.

The new garage of the Worcester Automobile Co., 84 to 88 Exchange street, Worcester, Mass., is nearing completion. A compound hydraulic lift has been put in, powerful enough to take the heaviest cars to the storage room on the second floor.

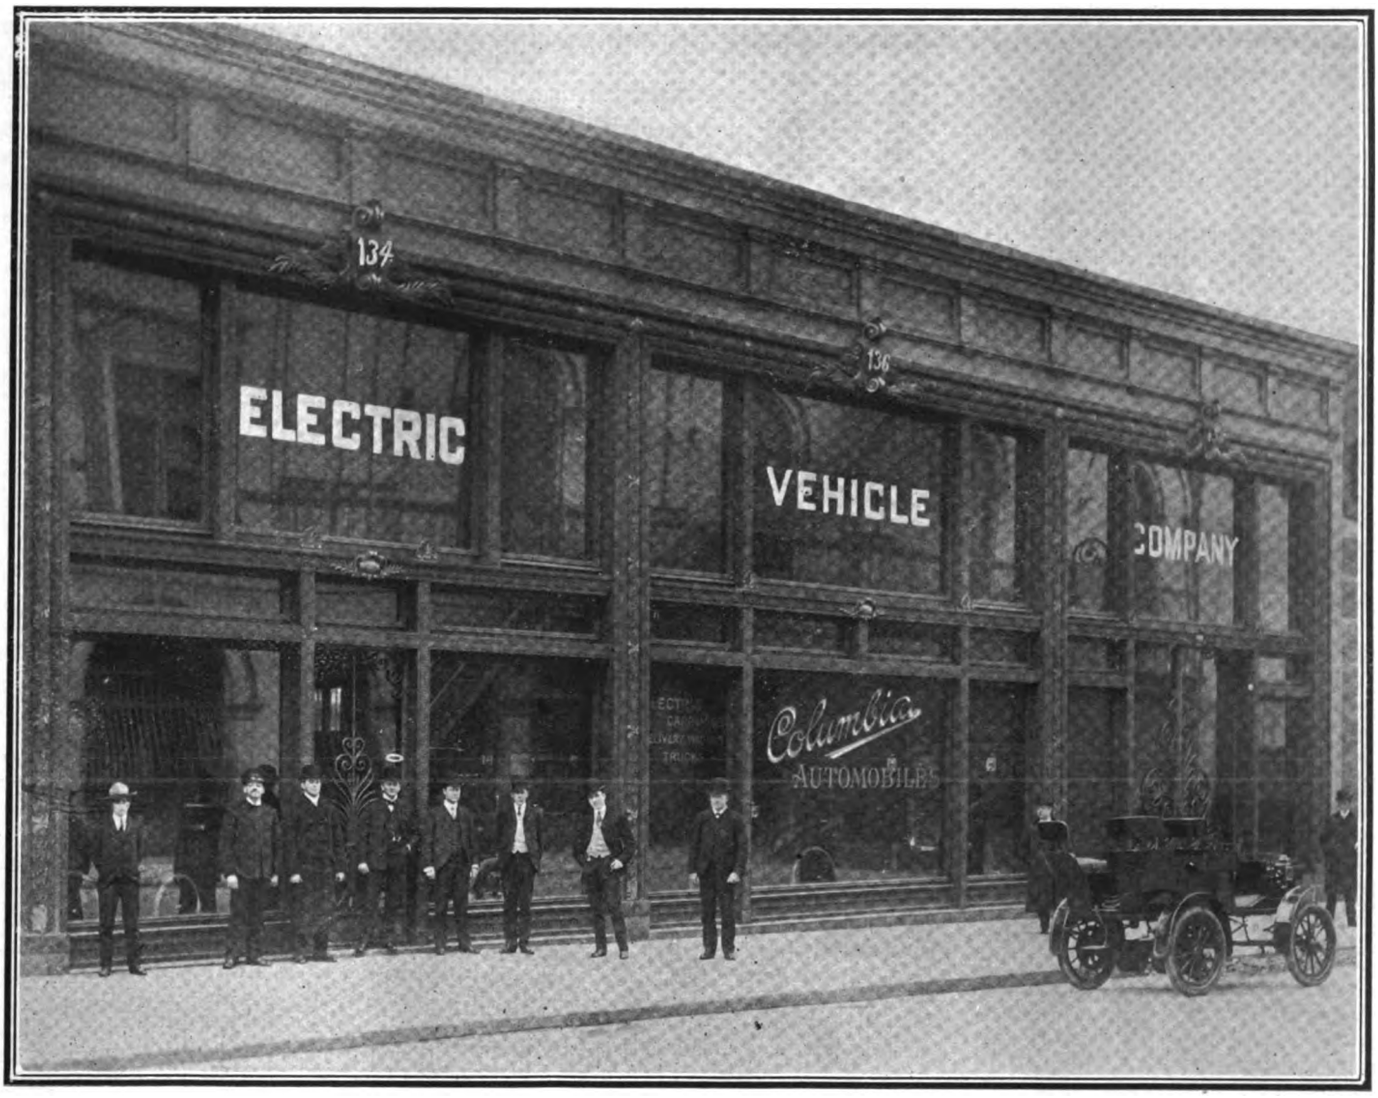
The Metropolitan Salesrooms and Garages—I.



Had it been specially built for them, the New York salesroom of the Electric Vehicle Co., at 134-138 West Thirty-ninth street, could scarcely have been better designed for the purpose. Centrally located, roomy, light, convenient, it is a show room par excellence, admirably adapted for the advantageous display of the Hartford concern's extensive line of self propelled vehicles.

The illustration gives a good idea of the exterior appearance of the building, which is one story in height. It is located directly opposite the south side of the Metropolitan Opera House, but a stone's throw west of Broadway, and presents an imposing appearance, with its seventy-five feet front of glass, reaching from the street to roof. Handsome signs on windows and doors, including the well known script, "Columbia," set off this portion of the building and make a favorable first impression.

This is greatly heightened upon entering. The building, 100 feet deep by 75 feet front, is in one room, broken only by a few columns, and this gives an appearance of vastness that is increased by the lofty roof and the dazzling brightness, the latter brought about by the front of glass and huge skylights in the roof at the rear. The oiled floor, free from all incumbrances, is occupied by a representative showing of the company's latest vehicles, so arranged that there is ample space to view them from all sides.

The station is, as Manager Armstrong explained to The Motor World representative, a salesroom and showroom, pure and simple, and its arrangement is in conformity with that idea. Absolutely no demonstrating vehicles are kept there. No charging is done; no repairs or adjustments made. Complete vehicles only, and these ready for sale, are displayed. To the left of the entrance and toward the rear is the office, with three or four salesmen's desks just outside of it. On the western side of the building a hydraulic lift for handling underslung batteries on trucks and other vehicles is shown.

Artificial light is provided by twelve electric arc lights, hung from the ceiling, insuring a plentiful supply at all times.

ELECTRIC VEHICLE CO., 134-138 WEST 39th STREET.

The new uptown station in New York of the American Darracq Automobile Co., at 147 West Thirty-eighth street, was opened last Monday in good style. There are two floors to the place, with a capacity for a dozen or more machines on the ground floor. F. A. La Roche is in charge.

JUSTICE IN NEW JERSEY

While Strict, Amended Scovel Bill is Fairly Reasonable—Passage Seems Assured.

Wise counsels have prevailed, and New Jersey autoists and legislators have reached an agreement on the Scovel automobile bill. The latter has been materially amended, and in this form, with practically unanimous support, it has passed the House of Assembly and gone to the Senate. There it is expected to evade opposition also and go to the Governor for approval, which is also looked for.

The bill is much improved. The most pronounced change from the original proposition regulates the speed at which the machines may be driven, it being provided that they may be driven one mile in six minutes, or ten miles an hour, along the sharp curves of and at the intersection of prominent crossroads in the open country; one mile in seven minutes, or eight and one-half miles an hour, in the cities and built up portions of towns, and one mile in three minutes, or twenty miles an hour, in the open country.

It is stipulated that when any governing body shall by ordinance or resolution permit a greater speed, such increased speed limitation shall be lawful in the city, borough or town so providing.

Drivers of autos must make declaration, duly verified, that they are competent to drive the vehicle, together with a brief description of it, including the name of the manufacturer and rated horsepower. Upon giving this information and on the payment of $1 for each machine registered, a license shall be issued.

Numbers on the vehicles shall be three inches in height and the strokes of a width not less than three-eighths of an inch, and shall be Arabic numerals. At night the numerals shall be placed on the lamps, which must be visible at least 200 feet in the direction toward which the auto is going.

At a signal from a person riding or driving a horse or horses in an opposite direction, drivers of automobiles must cause the latter to stop and remain stationary to allow such horse or horses to pass.

For displaying a fictitious license number a fine of $100 is provided, in default of which the offender may be jailed for thirty days. For racing a fine of $50 or twenty days' imprisonment is provided. For failing to display a number the fine is to be $25; for failure to carry lights a fine of $10. For violating the speed regulations the fines vary from $10 to $50. For a second offence the fine is to be doubled.

Hearst's Hand in Lawmaking.

Since William R. Hearst became the possessor of a "Red Devil" his enthusiasm for the motor vehicle has grown visibly. To further its interests in true jellow journal style he has arranged to have introduced at Albany by two Italian legislators—Messrs. Riordan and Bourke—a bill providing for the licensing of all automobilists. This bill provides for the licensing of all who undertake to drive an automobile, whether the machine is a public or private one.

The driver must at all times carry his license with him, and these will be issued only after strict examination as to ability to safely handle a machine.

The machine itself must, according to the provisions of this measure, be fully identified by means of prominently displayed letters and numbers, the former designating the class of vehicle, the latter corresponding to a full record of the name of the owner, place of storage and other particulars.

It is announced by the Journal that the bill will be introduced this week. As a sort of prelude or curtain raiser, and also at the instance of the Journal, Alderman Doull introduced a bill in the Board of Aldermen on Tuesday designated to apply to all public automobiles. It compels drivers of all public automobiles to display prominently at the back of their vehicles their license number.

Morrison and his New Duties.

The Peerless Motor Car Co.'s Boston branch, at No. 178 Columbus avenue, is now thoroughly established, and the new manager, A. E. Morrison, who relinquished the sales management at the factory in Cleveland, to assume charge of the Boston es-

tablishment, has the reins well in hand. That Mr. Morrison knows the Peerless and is equipped to advance its interests his factory connection makes manifest, and he is no stranger to the New England field, having been for some time with the Waltham Mfg. Co., where he obtained his first knowledge of gasolene engines. Later he was with the International Motor Car Co., and there added to his fund of information. Previously he was for eight years engaged in selling bicycles in California. That his ripe experience will bear fruit in his new position and that his efforts will make the Peerless car a big factor in New England it is safe to predict.

MAINE LAW MUDDLED

So Altered as to be Unrecognizable—Bar Harbor Obstructionists' Drastic Demands.

Originally favored by autoists—at whose instance it was presented—the automobile bill before the Maine legislature bids fair to be amended out of all semblance of its former self.

At the hearing before the Judiciary Committee it was urged that there would be great danger in permitting the use of autos on certain roads, such as those which run along the cliffs at Bar Harbor. It was then proposed that a provision be inserted in the bill giving the selectmen of towns the right to apply to a justice of the Supreme Court to close designated streets and roads to the steam, gasolene and electric carriages. Then objection was raised to this on the ground that it removed the roads from the care of municipal officers and county commissioners. It also appeared that the Bar Harbor folks wanted so many roads closed that some of the auto owners began to fear that they might be shut out of that resort altogether.

The bill is in the hands of a sub-committee which has been trying to reach an agreement which would be satisfactory to all parties. The committee has changed the speed regulations to meet the objections raised at the hearing, and stands ready to do what it can to make the bill acceptable to all parties interested, but it has not yet reported.

To prevent as far as possible the frightening of horses the automobile people incorporated in their measure a section which obliged the man in the auto to stop on signal from the man driving the horse, and that this might not be held to afford ground for an evasion of damages a section was put in the bill making it perfectly clear that the persons injured by the carelessness or ignorance of the operator of the automobile was in no way hindered in the recovery of damages. These things the auto people look upon as fair and reasonable, but they say that they do not want a bill which will shut them out of such resorts as Bar Harbor.

Cincinnati's Ordinance.

Backed by the Cincinnati Automobile Club, an ordinance regulating the use of automobiles has been introduced in the Cincinnati, Ohio, Board of Legislation. It was framed by Col. Max Fleischmann, of the club, and seems likely to pass. It provides a speed limit of seven miles per hour in the territory bounded by Court, Water, John and Broadway, and in other parts of the city and in parks, fifteen miles per hour. No person under sixteen years of age will be allowed to manage an automobile, and any driver or chauffeur will be compelled to stop on signal from a person driving a vehicle propelled by horse power. Owners are compelled to register their vehicles with the city auditor and pay a license of $3 per year.

"DEVIL," HOWLS WARREN

His Chief Argument for his Much Riddled Bill—Will he Flee to the Woods?

Although apparently very wide apart, Connecticut autoists and autophobes may be brought together ere long. Each side seems to be seeking the same end—the regulation, not the hampering, of automobile traffic. Indiscriminate racing and "scorching" are emphatically condemned. The present wise law, properly enforced, will, it is asserted, serve every purpose, and any change in in would result in harm.

All this was brought out at the hearing before the legislative committee on public health and safety, at Hartford last week. The three bills introduced by Representative Warren, of Lyme, were considered, as follows: H. B., No. 59, that power vehicles shall not be run over any country road except main thoroughfares of a town; H. B., No. 175, that every power vehicle shall be marked with the name and address of the owner; H. B., No. 173, that no power vehicles shall be run over country roads faster than eight miles an hour.

The discussion was led off by Representative Warren. "The automobile painted red, mounted on wheels, is a devil," he declared. The speed of eight miles an hour was the limit such power vehicles ought to attain. There is nothing ridiculous about the eight mile limit." There was a difference between eight miles and fifty miles an hour, and there were some machines of the 'Four Hundred' of New York that passed through his town at a rate exceeding forty miles an hour. Mr. Warren claimed that the horse is a necesity and that the automobile is a luxury. The bill simply put the automobile on the same level as the horse vehicle. He protested against the grinning automobiles doing him up; at least he wanted to file his protest before the automobile struck him. "If the State doesn't pass a bill we will take action ourselves that will be effective. This matter is getting serious," he said in conclusion.

C. B. Mason, of Bristol, said that he was opposed to the bills. It didn't make any difference how fast the machines were run; if horses were afraid they were afraid of the machines themselves. If a man wanted to run his machine at 30 miles an hour he would in spite of any 8-mile an hour law, but very few men wanted to drive that fast. It was impractical on the country roads and it wore out a machine much faster than the ordinary man cared to. He said that the 15-mile law was a fair one. There was hardly a man in the country who didn't own a good horse which he habitually speeded up to a 3-minute clip in the streets. It was untrue that autos were used for pleasure by only a few. They were becoming used more and more for business. The present law restricting speed to 15 miles an hour was a good one. It was easier to stop an automobile than it was a rapid-moving horse. The street accidents reported in the newspapers for the past few weeks had all been from horses and not from automobiles. Mr. Mason had taken a week's pleasure trip in his machine without a sign of an accident, nor a frightened horse. He was in favor of registration and identification of automobiles. Mr. Mason offered to take Mr. Warren on his automobile, and thought that that gentleman would soon want to own an automobile.

Frank T. Brown, of Norwich, appeared against the rate of speed bill and discussed all three bills before the committee. He had no doubt of apprehension in country towns as to the dangers of automobiles. He thought, however, that much of this was due to opposition to innovations of any kind. The legislature was asked to pass a law which was based on the misdemeanor of a very few. It had been said that the horse was lord of the highway. This was not so. The highway was for the purposes of travel. The time would soon come when horses would not be frightened at automobiles. They had become used to bicycles, electric cars and steam cars, and would soon not be frightened at horseless vehicles. It is from an old and good authority that "a horse is a vain thing for safety." The bill recognized the use of automobiles, and the speed limit of eight miles would be an embarrassment to law-abiding owners and drivers of automobiles. The bill would not accomplish the purpose desired. He could see no reason why an automobilist should not use any highway. It might, however, be hazardous for a machine to be run on some roads. It would be difficult for a court to define what a "thoroughfare" is. The common law was even a better protection against fast speed than the statute. Mr. Brown saw no objection to the registration of the automobiles.

Dr. E. B. Hooker, of Hartford, said the whole trouble had been from lawbreakers. Enforce the law, identify the lawbreakers, but do not punish the law abiding gentlemen and ladies who own and run automobiles. In behalf of the physicians Dr. Hooker said that the profession was using power vehicles more and more, and it would be a hardship to limit them to eight miles an hour when on an errand of mercy. It would be absurd.

Dr. E. J. McKnight had run an automobile for over a year and a half, and he thought, in fact he knew, that his machine was safer for himself and for the public than the safest horse in Connecticut.

M. J. Budlong, of the Electric Vehicle Company pointed out that several thousand workmen in Connecticut were employed in the manufacture of automobiles, and such drastic measures as are now before the Legislature would have a serious effect upon the industry and upon the sale of automobiles. He presented statistics to sho wthat automobiles could be stopped in less than half the distance a horse could be stopped.

Representative Warner, of Woodbridge, said that the farmers of the State desired that there should be some means of protection from the reckless automobile drivers. That was all.

Representative Armstrong, of Franklin, agreed to that proposition. The farmers did not want to exterminate the automobile, but to aid in controlling it, and in developing it.

Andrew F. Gates thought the gentlemen who had spoken for or against the bills were not far apart. The desire was to control the machines. The fact had been ignored that there was a law on the statute books to-day that would remedy all the evils complained of if it were enforced. All the incidents mentioned had been of violations of the law as it is. Some system of lettering or numbering machines might be added to the present law with advantage. Outsiders would then have to put Connecticut numbers on their machines.

A few days after the hearing Representative Warren rushed into print protesting against "ridicule from the press." He says that the "newspapers throughout the State have been opposed to the bill from the start. "As time passes on and the unpleasant things of life are thrust upon us," he concludes, "we must submit, and if we have got to flee to the woods to make room for the automobile, the sooner the better," whatever that may mean.

Ancient Tennessee Law Resurrected.

Some one has dug up an old Tennessee law restricting the use of steam vehicles on the public highways, and fears are entertained that it may be enforced against steam automobiles. The act provides that posters shall be put at all important intersections of other roads with the road to be used before any steam wagon or carriage shall be run upon any such road; and that vehicles propelled by steam may pass over any toll bridge or through any toll gate provided they pay double toll. The next section provides that it shall be unlawful to run any vehicle propelled by steam unless controlled by a competent engineer and then only upon any public highway, except between the hours of 9 o'clock p. m. and 4 o'clock a. m. The next section provides that every person operating a steam vehicle on a public highway shall keep a watchman at least 200 yards in front of such vehicle for the purpose of notifying any person traveling on the public highway of the approach of such vehicle; and it is made the duty of any person operating such vehicle to stop the same and stop the escape of steam and stop all unnecessary noise on the approach of any wagon, buggy or horseman until the same shall have passed. The statute further provides that every person failing to comply with or violating the provisions of this law shall be liable to all damages caused by such violation and shall also be punished for a misdemeanor.

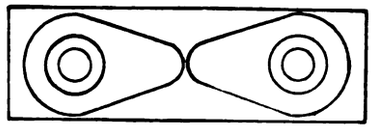
Light That Does Illuminate.

Too much light is a venial fault in a lamp and one that few autoists are likely to complain of. The Lens Mirror Searchlight of the Rushmore Dynamo Works, Jersey City, N. J., has been accused of being too bright, but its makers claim that in use it is all that could be desired.

The lamp is a copy in miniature of the standard Navy Electric Searchlight, except that an acetylene gas flame is made to do service in place of electricity. The generator will supply about twenty-five cubic feet of gas, sufficient to give seven hours' light. The arrangement of the carbide receptacle is unique, the carbide remaining in place on a grate in lumps, the waste falling into the ash pan below as a dry powder.

With this lamp objects fifteen hundred feet distant can be plainly perceived, while by using the controlling gear the light can be thrown in any desired direction.

Walton Makes Change.



H. E. Walton, who has been connected with the Peerless Motor Car Co., Cleveland, Ohio, as purchasing agent, has associated himself with the Shelby Motor Car Co., of Shelby, Ohio.

John Maxwell, of Oneida, N. Y., has been appointed agent for the Haynes-Apperson cars. His territory covers twenty counties in New York State, west of Albany.

These Should Sell Like "Hot Cakes."

The discovery that no matter how foul the spark plug a spark and explosion can be secured by interrupting the circuit and providing an external gap to be jumped by the current has been quickly turned to advantage.

Abroad several "interrupters," or "intensifiers," as they are variously termed, have made their appearance on the market, and in

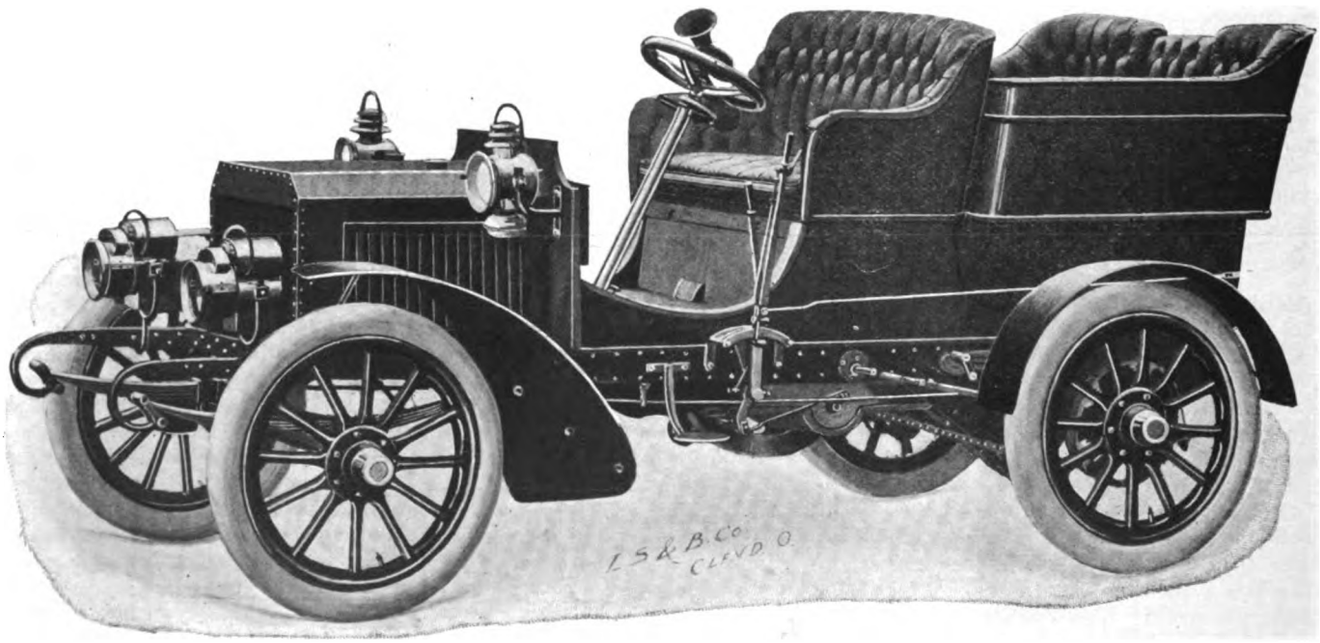
this country, A. H. Funke, No. 325 Broadway, New York, has been first to seize the opportunity. His device is simplicity itself, as the accompanying illustration makes plain. It consists of layers of mica into which are eyeleted two copper fingers, as shown. In one eyelet the end of the plug is secured, in the other the end of the high tension wire. The outside and visible spark jumps from the tip of one finger to the tip of the other.

As the Funke "intensifier" can be marketed at a merely nominal price, that it should meet with an instant and large demand appears certain. Considering its invaluable nature, it would not seem that there are many men owning a gasolene motor who would not have one or more devices constantly about his car or person.

Century's Expansion.

The Century Motor Vehicle Co., Syracuse, N. Y., have been successful in securing an additional building adjoining the one already occupied by them. A lease has accordingly been taken on the four story brick building at Nos. 510, 512 and 514 East Water street. The force of employes will at once be increased.

From $6,000 to $7,000 worth of new machinery is being received, and a 26 horsepower gasolene engine is being installed in the machine shop at a cost of $1,200. The first two floors of the newly leased building will be used for the offices and salesrooms, while the third and fourth floors will be used for the building and finishing of the body of the machines.



"We have orders ahead for 500 machines," Secretary Elliott is quoted as saying, "and we are planning for a plant to turn out 1,000 next year."

Miller's Foreign Chains.

Charles E. Miller, the Reade street importer and jobber, has received from England the first shipment of Brampton chains, for which he recently secured the American agency; this first shipment is of Panhard sizes. That Miller's deal was not designed merely to cover chain replacements on foreign cars, as some have claimed, he makes plain. He says he is ready and in position to quote interesting prices on the Brampton to any American automobile manufacturer.

THE STEARNS CAR

Received a lot of very favorable comments at the show.

The style and general design is right. The motor is powerful, with a perfect throttle, and runs silently and with no vibration. The attachments on the dash and controls at the wheel are good points, too. The small tube radiator is ahead of the time, and considering all things, **STEARNS CARS are worth more than they cost.**

Cadillac Auto. Co. of Ills.,
1312 Michigan Avenue, Chicago, Western District.

F. B. Stearns Co., Cleveland, O.

CONCERNING COMPRESSION

Some of the Misconceptions That Exist Regarding it—Losses Through Exhaust.

"Although gas and gasolene motors are now in use to the number of many thousands, the average person seems to be better acquainted with the modus operandi of the steam engine than that of the explosion engine, and conditions of operation of the first are often erroneously applied to the second. Thus, for instance, the fact being well known that a high ratio of expansion in steam engines leads to economical results, gasolene car builders, imperfectly understanding the theory of that machine, often seek to devise means whereby similar effects can be produced in such engines. While it is true that carrying the expansion further than usual in explosive engines results in higher economy, the methods and means employed to this end must be entirely different from those used in steam engine practice. It is often suggested that if the stroke of an engine were doubled, without increasing the bore, the gases would be expanded to a much lower pressure before the exhaust took place, and consequently a much greater proportion of the heat value of the gases would be turned into useful work, whereas it is plain that such a proceeding would not result in increased expansion," says the Motor Car Journal.

"Similarly the effect of a higher or lower compression is not as well understood generally as it might be. It is known, of course, that the degree of compression employed affects the power of the motor, its fuel efficiency, the exhaust, the ignition, ease of starting, etc., but the nature of its relation to these various factors is not clear to many chauffeurs and experimenters. During the suction stroke the engine draws in a certain quantity of explosive mixture, depending upon the displacement of the piston per stroke, but independent of the compression space or the proportion of bore to stroke. After the mixture has been compressed it is ignited and burned, and the heat energy developed by this combustion is a fixed quantity, independent of the compression; the only thing which affects the quantity of heat developed is the proportion of the mixture, which is here assumed to be constant and the most favorable.

"Of the heat liberated by the combustion of the mixture, a portion is converted into mechanical work, and the rest is dissipated through the cooling water and the exhaust gases. The distribution of the heat is affected by almost every change in the proportions of the combustion chamber, and a decrease in the compression space, and consequent increase in compression, increases the proportion transformed into mechanical work, by decreasing the proportion going into the cooler water. A decrease of the compression space means, of course, a reduction of the cooling surface with which the burning charge is in contact, especially during the first part of the power stroke, and the direct cause of the diminished loss through this source is therefore apparent.

"The question as to what influence the compression has upon the exhaust pressure is also of some interest. One view is that a low compression has the two serious disadvantages of the violence of the exhaust and the excess of heat thrown away due to a less complete expansion than would be obtained if the compression space were smaller. Another opinion is that the exhaust pressure will be higher, if anything, in a high compression engine. This would mean, of course, that the loss through the exhaust gases is greater with high compression, and this we believe to be the case, although the increase may be slight. The gain in mechanical power is then entirely due to a reduction of the jacket losses.

"This conclusion is in line with the view entertained by M. Richard, a prominent gas engine authority, who states that any means by which the loss through one of these two great sources of waste (cooling water and exhaust) is reduced results usually in an increased loss through the other one. In two engines, otherwise the same, the quantity of gas per unit of cylinder volume (the density) at the end of the power stroke would be greater in the one with the smaller compression space; but density alone does not fix the pressure, which is also dependent upon temperature.

Novelties in Motors.

Among the departures from conventional designs seen at the British show was the Bardon gasolene car. The explosion takes place between a pair of pistons, which work separate cranks, one on each side of the car. The cylinders are duplicated, and consequently there are four pistons working in two cylinders, driving two double throw cranks, one on each side of the car. These are connected by means of double bevel gearing with the clutch or first motion shaft. This has the sliding gears of the change speed upon it, the fixed gears being upon the differential shaft, which is connected by outside chains to the road wheels.

The Brookes car also differs from the usual practice. The three cylinder vertical engine is set across the car, so that the crank shaft is parallel with the wheel axles. In other respects it differed little from the usual European design.

Wants More Artistic "Bowsprits."

"What can be more inartistic and show such poverty of invention as the cutting off of the horse from cars shaped like previously horse-drawn vehicles, broughams, victorias, etc.?" asks an autoist.

"In the rightful finish of the motor-head, or prow, there is endless room for improved artistic forms of the bows. The figureheads of oldtime ships, of gondolas, sledges, and even of elephant, howdahs, point the way."

REGISTERS ON A TAPE

Ingenuity of Prize-Winning Mors Timing Device—Renders Mistakes Impossible.

Further particulars regarding the Mors timing apparatus, which proved the victor in the Automobile Club of France's Dourdan contest make plain its chief feature. This is that the chronometer used is not started and stopped during the trials, but runs continuously. As it works, a paper strip is drawn through it, an electric contact perforates the paper, and marks the minutes, seconds and fifths of seconds. Whether the paper passes at the same speed or at varying speeds makes no difference to the result, for each perforation represents a fraction of a second registered by the watch. The passage of the car at the starting post and also at the finishing post is marked on the tape, and the number of perforations between the two marks gives the time which has been occupied by the car in covering the measured distance. The paper tape may be kept for reference, and no mistake can be made, for the perforated record establishes indisputably the time occupied by every car.

With the ordinary chronometer with a stop movement the stop, quick fly back and restart movement destroys in a large measure its accuracy; whilst the apparatus invented by Mors, or rather by M. Pottier, the electrical engineer, who is at the head of the electrical department of the Mors firm, utilizes the chronometer without the stop motion and thus obtains its full accuracy.

The second prize of the competition has been accorded to M. Stocker, of Vienna, who has also a very accurate apparatus; unfortunately it is three or four times the price of the first one, but it is understood that these two are to be officially authorized by the A. C. F.

The question, however, as to automatically registering the passage of a car over the starting and finishing point has not yet been settled, for the wire stretched across the track has been found a complete failure; a project of making an electrical contact by a wire touching the chassis as it passes is being studied.

Care Necessary in Using Emery.

Emery powder is just the thing to use for grinding valves, but it is sure death on piston rods or other working parts. In grinding an exhaust valve seat, therefore, it is advisable to place some cotton between the combustion-chamber proper and the cylinder, in order to prevent any emery powder gaining access to the latter, which might result in the scoring of its walls.

The First Ice Wagon.

"The Atlantic City Ice Co. will be the first to introduce automobile ice wagons here. Proprietor John Fessler is in New York to order several of them."—(Atlantic City Times.

THE MATTER OF TIRES

Why Tests Have Been of Small Value and Why Better Tires are the Rule.

"The tire itself being no part of the propelling equipment of the automobile, there is certainly no reason why the record of the motive power should suffer for tire troubles. But since the tires are necessary to the operation of the vehicle, and the reliability of the tires an essential feature, it would seem reasonable for a report on a reliability run to cover every detail instead of only a report on reliability of the motive power. The object of the run obviously is to give the intending purchaser of an automobile—whether he be one of the interested public or an enthusiast in search of a better machine—an idea of the relative ability of machines to do various kinds of work. Certainly the tires are essential to the proper performance of this work. It is harder for the novice to judge of a set of tires than of the vehicle itself. He is forced to take the advice either of his dealer, which is liable to be prejudiced by considerations of price, or of some friend, whose experience must necessairly be limited, both as to makes of tires and the number of sets of each make that he has become familiar with.

"Where more than one braiad of tire was used by any one kind of vehicle these data would, of course, be most valuable. In cases where a difference in the kinds of vehicles somewhat varies the conditions, the classification of the vehicles by weight makes this difference a small factor. The care used by the individual operator of the vehicle in starting and picking his road, as well as his control of the speed, has more influence on the wear on the tires than a difference of several hundred pounds in the total weight of load. Tires, therefore, used on the same class of vehicles would be as nearly under same conditions as it is ever possible for tires to be. A separate tire testing contest might have much influence, but the one lately held in England was of little value because of the limited number of makes of tires entered. But the value of such a test, even when more representative, could never equal the value of a complete report on the tires of a reliability run," says a writer in the India Rubber World.

"There can be no doubt in the mind of any one who watched the endurance runs of the past, and who followed the progress of this year's run, that great improvement has been made in the matter of tires. This has been due in great measure to advances in the art orf tire making—in the compounding of rubber for tires, in improved (because stronger) tire fabrics, and in details of designs of tires. But another thing has contributed no less to this favorable result—namely, the automobile manufacturer is beginning to see the reasonable side of the tire manufacturers' point of view. For several years the rubber manufacturer has been told to finish the tires 'as ordered,' and in far too many instances the order was based solely upon price. The tire maker, knowing as he does that the average vehicle uses up several sets of tires, has an even deeper interest in th success of his product than the automobile manufacturer has, since a good showing in the matter of tire efficiency will secure for him the renewal of trade, while a failure will be sure to induce the user to change. With this idea in mind the various tire manufacturers have conducted extensive tests, the results of which, added to the information secured from customers, have given them a fund of information more comprehensive than that of the automobile manufacturer himself. This puts the tire man in a position to furnish the automobile manufacturer with the tire best suited for the requirements of the latter. The question of diameter of tires should always be left to the tire manufacturer, and in many cases the diameter of wheels would be altered if he were taken into consultation.

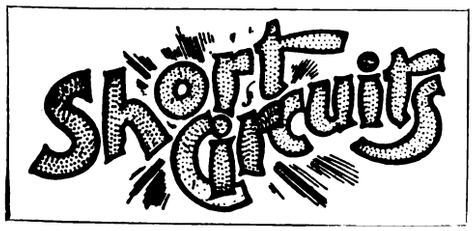
"Although anything like exact data bearing upon tires was entirely lacking in the late run, it is a fact that no other line of progress in the field of motor vehicle manufacture was so apparent to the veteran of former runs as the improvement in this, evidenced by the lack of tire troubles. Almost as conspicuous was the ease with which tire repairs were effected, and the lack of the old exhibitions of dread displayed by the operators of the contesting vehicles as they set about a job of repairing punctures. A certain degree of satisfaction must be felt by every manufacturer of automobile tires in the United States at so creditable a showing, and every effort should be made to induce the Automobile Club of America to include in its records in future a detailed report on the work done in all its runs by the different tires entered."

AT A BUSY CORNER IN NEW YORK.

THOSE PART-CASH SALES

Why They are Open to Suspicion and Appear Subterfuges to cut Prices.

"There is no instalment business being done yet, but some dealers are leading up to it," remarked a tradesman to the Motor World man last week.



"I know of one man who closed a deal a short time ago in which some real estate was part of the consideration. Now, there is real estate and real estate, and there is a kind that any dealer could accept if he wanted to bother with turning it into cash. But this particular real estate would be very difficult to turn into money, or into anything else. It is supposed to be on the seashore somewhere in the wilds of Jersey, but I have a strong suspicion that it would be hard to find when the tide is in. The seller was not very communicative about it, and the dealer did not ask too many questions. Perhaps he was afraid of being told too much, as he got part cash and he may have been satisfied.

"But for my part I don't care to let good automobiles go for real estate. even when I can see it."

Death of an Early Worker.

There died at Marion, Ind., last week an early worker in the automobile field. Thirty years ago Leonard Anderson, who then resided at Painesville, Ohio., built a steam carriage and ran it around town, much to the disgust of the inhabitants, who raised a howl because the machine scared so many horses. Anderson abandoned his auto under public sentiment, but declared that the motor carriage would come into general use, and he would live to see it. His prophecy has been fulfilled. He died at the age of seventy-nine, and will be buried at Painesville.

Digitized by Google

An English odometer is fitted with a bell that rings at stated distances.

The municipal authorities of Wanganni, New Zealand, have ordered a motor fire engine.

An 80 horsepower C., G. & V. car was ordered by C. M. Schwab, of the United States Steel Co., last week.

The King of Belgium added to his "stable" by purchasing a new C. G. & V. car at the Brussels exhibition last month.

Eight new members were elected by the Milwaukee Automobile Club last week, bringing the number up to 49.

It has been decided by the Automobile Club of Bridgeport, Conn., to hold a banquet at each annual meeting. The latter occurs on the first Monday in April.

In 1901 Paris contained 98,868 horses; in 1902, 91,976, and in 1903 there are supposed to be 90,926. The steady decline is attributed to the ever extending use of the automobile.

The following new active members have been elected to the Automobile Club of America: Robert W. Goelet, Spencer Trask, Jacob Ruppert, Raymond Owen and F. A. Thompson.

There is talk among San Francisco autoists of holding a non-stop run around the bay. The Automobile Club of California will probably be asked to take charge of it, the trade guaranteeing its support.

So ardent is his desire to become the possessor of an automobile that a Springfield, Mass., man offers to exchange his house for one. That beats graveyard lots and similar objects of barter that are not easily realized upon.

When testing the spark by holding the end of the high tension wire near some part of the engine or frame, never hold it more than one-quarter inch away. An attempt to get a longer spark may produce a short circuit in the coil.

At the Automobile Club of America last Tuesday night there was an illustrated lecture by Dr. Ulysses Kahn on "Camp Life, Customs and Scenery in Abyssinia." Dr. Kahn was surgeon for Count Leontiff's expedition to Abyssinia.

Autoists can scarcely be too strongly impressed with the desirability of making a free use of gasolene or kerosene for cutting away grease or gummed oil. It has an almost magical effect. A sticking valve, clogged piston rings and crank cases and crank bearings will, thus treated, work beautifully.

An informal preliminary meeting was held at the Galt House, Louisville, Ky., last week by autoists desirous of forming a club. Dr. J. W. Irwin acted as chairman. It was decided to meet again on March 13 to perfect an organization.

Mme. Lockert will have a woman companion in the Paris-Madrid race. In the list of entries appears the name of Mme. du Gast, a fair Parisian chauffeuse of considerable celebrity. She has drawn No. 29, and will, therefore, start in that position.

Registration is taking place more rapidly among Philadelphia autoists. Up to March 1 nearly one thousand had registered at the City Hall, a number of them being the owners of more than one vehicle. It is estimated that there are two thousand automobiles in that city.

The effect of the automobile in the future will be to prevent to a great extent the undue extension of cities as residences, while extending their commercial prosperity as centres for the working business of the country," declares Sir John McDonald, the Canadian statesman.

The French Court of Cassation has reversed the decision of the justice at Châlon-sur-Saône, who declared illegal the decree of the Mayor fixing at less than the rate of the general regulations the speed for automobiles in the towns and villages. Consequently the mayors within the thickly inhabited districts will have power to fix, by special decree, the speed of automobiles, and this, notwithstanading the provisions of the general regulations.

The Long Island Automobile Club is looking for new quarters, where it can have storage facilities for the accommodation of its members. According to one of the officers of the club, an option has been obtained on a building in the Bedford district of Brooklyn, where there will be room in the basement for the storage of twenty-five cars. As the matter has yet to go before the governors of the club, the house committee is keeping the exact location of the new place a secret.

At a special meeting of the Board of Governors of the Rhode Island Automobile Club, held last week, the subject of the State's neglected highways was taken up. It was decided to urge the present Legislature to appropriate the sum of $100,000 for the purpose of carrying out the recommendations of the State Board of Public Roads, whose recent report showed the general condition of the main highways throughout the State.

Notices have been sent out to the club members asking their co-operation and help to secure the passage of the resolution in the General Assembly at this session.

Contempt of Gasolene.

That familiarity breeds contempt is shown by the way dealers and other tradesmen handle gasolene. In spite of its evil name it has no terror for them. They know that it is dangerous only when mixed with a certain quantity of air.

"Pshaw, these regulations and restrictions make me tired!" exclaimed a Brooklyn dealer to whom the subject was broached. "Instead of affording protection from fire, as is their avowed object, they ruin the business of legitimate tradesmen and do no real good.

"Now take my case. There is a dwelling house over my store, consequently I am permitted to keep gasolene on the premises only in microscopic quantities. But the people who live in the house and thousands of others similarly situated have practically a free hand in the matter. They know nothing about the handling of gasolene, yet use it in quantities for cleaning clothes, etc., and the wonder is that there are not more fires originating from it. Now, I use plenty of gasolene, but can't keep it on my premises, although it is perfectly safe in my hands. I could touch a match to it and hold it there, knowing full well that nothing would happen. But I must send out a dozen times a day for it if I obey the law; and if I don't the authorities may come down on me at any moment and fine or even imprison me."

When Misery Does not Love Company.

There is still sufficient novelty about the automobile to cause people to stop and watch a vehicle that is in trouble..

A little runabout turned from Nassau street and headed for Broadway one day last week, when it came to a stop in front of the Times Building. Instantly two or three hurrying pedestrians stopped. In about thirty seconds their number had been increased to nearly a score, all intent on watching the runabout and seeing what the chauffeur would do to locate the trouble. Without leaving his seat he leaned over and gave the crank a turn, but the flywheel after going about half a dozen turns came to a stop. Interest deepened on the faces of the spectators, and their numbers increased. Another turn of the crank resulted as before. A third attempt, made after some manipulation—presumably of the mixing device—was more successful, for the engine started up all right and the vehicle rolled across Broadway and disappeared in the distance. The crowd seemed disappointed and rapidly dispersed.

The Chicken Killing Trick.

The story is far from new, but the naiveté of its latest telling makes it worth repeating.

An Irish autoist ran over a chicken. The bird was not hurt, but he gave the old woman who owned it a sixpence, and in return she told him a secret. "When I wants a pullet killed, I sends them into the road, and as like as not it's killed and paid for, and I has my pullet into the bargain."

Opening the Farmer's Brain.

"The city folk ride their swift and shining automobiles into the country; and we are getting so used to the innovation that the most countrified of us almost forget to stare. We are becoming reconciled. Yet this seems to be only the beginning of the fight against the horse in his own country—the real country, the country of farms, of plows and harrows, of drills and harvesters, of top buggies and hay wagons, and of the ever present horse to make them 'go!' The automobile is going into the country to stay—so we are told," says Scientific Farms.

"The best organized Grange county in Michigan is Lenawee, with its thirty-six granges that average a little better than a hundred members each. It is in Lenawee County that the automobile is trying to drive the horse out of the business of carrying the rural mails. The effort has been systematically made, and the tests of efficiency of the horseless vehicle have extended over a period of a full month. Mud, frost, and deep snow have had to be contended against; and yet the automobile is said to have been able to do the work twice as fast as the horse.

"It is said that the Lenawee County farmers were prejudiced against the new method of carrying the mail to their doors. They are friends of the horse. But friendship and prejudice are not expected to avail. A writer in a St. Louis paper says that the postmaster who has had the experiment in charge thinks "that the people along the routes, whose attitude toward the automobile heretofore had not been friendly, came to regard the machine with admiration, and he believes that all that is necessary to allay the sentiment of unfriendliness toward automobiles now existing among our rural citizens is to demonstrate to them the machines' immense advantage over their four-footed contemporaries.

"Doubtless the horse is to remain with us as a prime necessity at least during the present generation of farmers, but the rapidly increasing population of the country promises to make the change from the horse to the automobile a real promoter of civilization. The farmer will have to make the best of the situation."

"Private Bottle" System Abolished.

One of the most novel and distinguishing features of the Automobile Club of America is to be abolished. This is the private locker system maintained for members in the grill room. The club governors have decided to take out a club license and have a buffet bar.

The locker system is one that has attracted much attention. No liquors are sold at the club, but almost every member has a little cabinet stored with bottles of various sorts. It has been no uncommon thing in the past to see two members enter the grill room and each take from his locker a bottle and then sit down together for a "Dutch treat."

Protected Against Damage Suits.

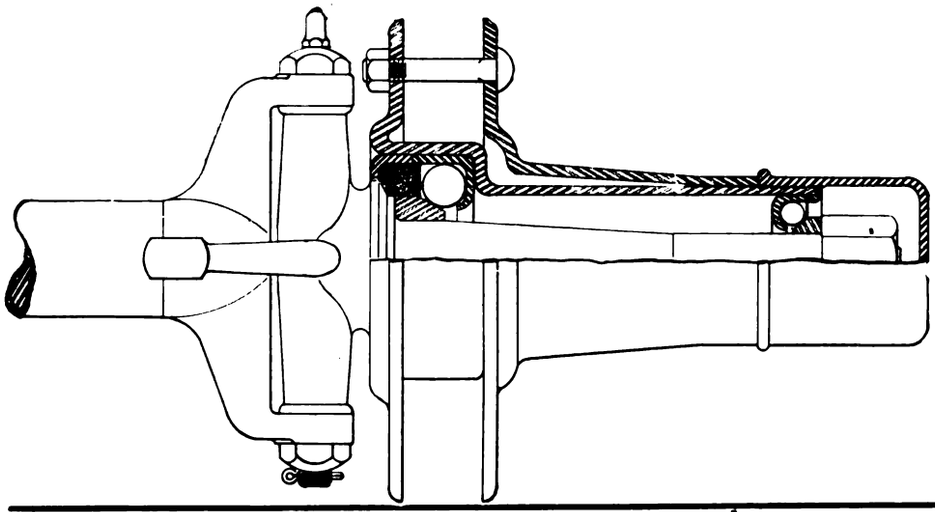
A number of Providence, R. I., automobilists are carrying liability insurance protecting them in case of suits arising from accidents. The rates are said to be frightfully high, but a well known autoist stated the case in this way:

"People will bring a suit against you for the most trivial cause, and are even looking for a chance to get an action against you. The average jury are prejudiced and do not look upon the automobile with any feeling of kindness, and while the defendant in a case may be in the right, public opinion is certainly against the auto. Speeding the machines around the busy streets by a few reckless owners is no doubt the cause, and as the autos become more general, accidents more numerous, a man to be on the safe side must pay out a large sum of money each year to ease his mind and feel protected."

No Race on Long Island.

The governors of the Long Island Automobile Club have practically given up the idea of having a 100-mile road race on Long Island. It has been advised by its attorney that the county supervisors or other officials have no power to grant permission for a race. The Cocks law fixing the speed limit, according to the lawyer, is a State statute that cannot be contravened by any local authorities, and its operation could not be suspended for a minute except by the State Legislature. It is unlikely that the club will appeal to the Legislature, but it is more than likely that an effort will be made to have a race under its auspices sanctioned in Connecticut, where the State law especially provides for the speed limit being suspended by local officials for the purpose of holding a race

Tour and Racemeet Planned.



An active season is contemplated by the Cleveland Automobile Club. A tour and meet committee has been appointed, with Charles B. Shanks as chairman and W. C. Baker and W. L. White as the other members. A tour into Canada is planned for this summer, the intention being to go by boat to Detroit, thence across the ferry to Windsor, where the tour will really begin.

A race meet on the Glenville track is also talked of for May 30, but many members consider that too early, and favor a September date instead.

Collegiate Meet Possible.

There is talk of holding a combined intercollegiate and interscholastic automobile race meet. All colleges or schools having automobile clubs will be invited to enter, and the club scoring the greatest number of points in all classes will be declared winner and presented with a cup, which can be kept for one year. A meeting will be held, probably in this city, by the representatives of the various schools and colleges in the East some time next month.

His Home-Made Tilting Wheel.

Cheerfully crediting the idea to an American who had "contrived something of the kind," an English autoist relates how he has had a tilting steering wheel made for his own use.

"Having lately purchased a small car, I found much inconvenience in getting in and out of the driver's seat, after my wife had taken her place, the difficulty, of course, being caused by the position of the steering wheel, and the trouble being increased by having to wear a thick fur lined coat during cold weather. When driving, if I had to get out to attend to any matter in connection with the car or for any other purpose, much difficulty was experienced unless my wife got out first—a most convenient arrangement.

"With the aid of a good cycle maker I have devised a simple method of tilting the wheel vertically in front of the steering column, and by this means obviating the trouble. A small wrought-iron hinge is placed immediately under the wheel. This hinge is three inches square when closed, and is made of three-eighths inch iron plate. The pin of the hinge is also three-eighths inch in diameter, is three inches long and well riveted at each end. The bottom part or half of the hinge is secured by screws and nuts to the plate usually fixed on the top of the steering column. The top part of the hinge is fastened in like manner to the wheel itself. In order to prevent any upward movement of the wheel when driving, a bolt goes through the top of the wheel and also straight through both halves of the hinge and plate on the top of the steering column. This bolt is held in its position by a spring, and both bolt and spring are contained in a socket fixed into the top of the wheel. To tilt the wheel it is only necessary to pull up the brass knob fixed on the top of the bolt. The wheel and bolt fall into their places by the weight of the wheel."

Rhoads on the Horse.

Instead of being doomed the noble horse is destined to become more highly prized as the years pass. Neither automobiles nor flying machines can stay his progress.

"The horse is used now more extensively than ever and his use is growing," declared Dr. W. L. Rhoads in his annual address as president of the Pennsylvania State Veterinary Society, at Philadelphia last week.

"The bicycle, the automobile and other rapid mechanical devices that have sprung up of late have their uses, but they can never take the place of the noble horse, that will ever be a companion, as well as a useful beast, to its interested owners.

"The electric cars only extend our appreciation of the noble beast, and only the advent of a practical flying machine can decrease the interest steadily growing in the equine animal, and that, like other transportation machines, will decrease each interest only for a time.

"The increase of horse valuation within the last three years has been phenomenal, and will undoubtedly continue—due to the inadequacy of the supply compared with the demand, and this deficiency is going to increase from year to year."

A Timely Fable and its Moral.

When, in the long Process of Natural Selection, the Stag-Beetle was first evolved, he aroused great Jealousy and Disdain in the Thorax of the Cockchafer.

"Blundering Brute!" he buzzed, "with that big Body and those little Wings, he'll never be able to fly, I know."

But the Stag-Beetle soon falsified this Prediction, for in the Twilight of the very Summer's Day on which he was hatched he soared high towards the Stars, there disporting himself like an aerial Porpoise amid atmospheric Waves.

"Great Goat-Suckers!" boomed the enraged Cockchafer, who had hitherto regarded it as his own especial Province to wheel his droning Flight of a Summer's Eve. "Did you ever see anything so insecticidally reckless? Look! There he goes! Slap-Bang through a Swarm of helpless Gnats, taking off Legs and Wings in all Directions. This must be put a Stop to."

"I quite agree with you, my dear Buzzard-Clock," replied the Bumble-Bee, to whom these Remarks were addressed. "The way in which that lumbering Lout blunders along is simply intolerable. Let us at once convene the other Insects and bring his Conduct before them."

So the Insects were convened, and the Cockchafer moved, and the Bumble-Bee seconded, the following Resolution:

"That, in Future, no Stag-Beetle, when flying, be permitted to flap his Wings more than four Times per Minute."

"You have heard the Resolution," said the Hornet, who presided. "Would any Insect like to buzz to it?"

"I should," said the Wasp. "We have heard a good Deal about the reckless, blundering Stag-Beetle. But how about the lumbering, never-look-where-they're-going Bumble-Bee and Cockchafer? I move, Sir, that they also be included in this Resolution."

At this a loud Murmur, partly of Approval, partly of Dissent, arose. At length, Silence being restored, the Hornet pronounced:

"The Wasp is right. Clearly the Stag-Beetle is on all sixes with the Bumble-Bee and Cockchafer. Either, therefore, they must all have the same Freedom of Flight, or all be subject to the same Resolutions."

It ended in the Bumble-Bee and the Cockchafer sulkily withdrawing their Resolution.

Horses Barred From French Fete.

Horses are to be barred absolutely from the Mi-Careme fete at Paris, some fifty automobiles being selected to carry those who take part in the procession. As if that were not bad enough for the once proud equine, the Reine des Reines, or Queen of Queens, is a horse butcher!

When the Automobile Club of France gave the fete its approval, the French trade evinced an active interest in it. Elaborately and fantastically decorated cars are being got ready, and it is expected that the procession will be the most picturesque of the kind ever held. The De Dion-Bonton people are building the principal car, which will be the "clou" of the spectacle. Few will imagine that a machinist is hidden in the flower pot which will be a prominent feature of the vehicle.

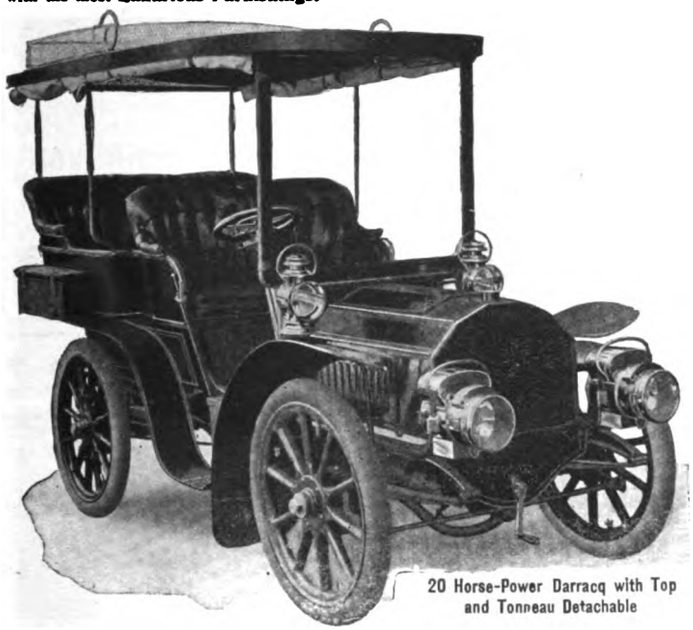
Baron de Zuylen is to give a well filled pocketbook to the "Reine des Reines," and champagne and sandwiches are to be offered galore at the Automobile Club.

It is suggested that some of the big shops paying especial attention to automobile clothing shall design a costume for the Queen, who would, of course, be represented as a chauffeuss.

May Close 'Frisco's Reservation.

The Presidio Reservation, San Francisco, has been a favorite resort of automobilists, attracted by its fine, smooth roads and by the splendid view of bay and ocean. No hampering restrictions have been imposed upon the drivers of motor cars. Now, however, it seems that there is danger of the area open to San Francisco automobilists being still further restricted. The military authorities think that the motorists run at too high a rate of speed, and endanger the lives of the pedestrians, who are compelled, through the absence of sidewalks, to walk in the roads. Fast driving of horses is expressly forbidden by notices posted at all the entrances to the Reservation, and, if the automobilists continue to travel at great speed along the roads, the Commandant may exclude them altogether from the most picturesque spot in the city, and thus deprive many innocent persons of a delightful recreation. And such is the conservatism of the military mind that, once a commandant has issued orders for the exclusion of automobiles, it will be harder for the motorists to regain admission to the Reservation than to win over the Park Commissioners.

Haffen Promises Road Reform.



Immediate attention was promised by President Haffen of the Borough of The Bronx to the roads complained of by representatives of bodies interested in highway reform. The matter was brought to his attention on Friday last, when a public hearing took place in the New York City Hall. Jerome avenue above Harlem Bridge, and Broadway from Kingsbridge to the Yonkers line, were pointed out by President Shattuck of the A. C. A. as being in especially bad condition.

The Week's Patents.

721,580. Power Propelled Agricultural Implement. David Lubin, New York, N. Y. Filed June 25, 1902. Serial No. 113,115. (No model.)

Claim—1. In an implement of the character described, a carriage, a motor, a digging tool supported on the carriage, and gearing operated by the motor for alternately propelling the carriage and operating the digging tool.

721,401. Variable Speed Gearing. Colcord Upton, Beverly, Mass., assignor to Upton Machine Co., a corporation of New York. Filed December 27, 1899. Serial No. 741,715. (No model.)

Claim—1. The combination of a driving part, a driven part, a sleeve mounted to rotate around the driving part and to which the driven part is connected, a rack mounted to rotate around the driving part, means to limit rotation of said rack, a gear in mesh with said rack, means for communicating independent rotation from the driving part to said gear, means to lock said rack to the driving and driven parts, meanc connecting said gear with said sleeve to actuate the latter and the driven part by the movement of said gear along said rack, a rack rigidly connected with the driven part, means to limit rotation of said rack, gearing connecting the driving part with said rack, a rotative member carrying part of said gearing, and means to limit rotation of said member, substantially as described.

721,413. Motor Car. Herbert Austin, Erdington, near Birmingham, England. Filed April 23, 1902. Serial No. 104,409. (No model.)

Claim—A motor car or vehicle having a motor with its shaft extending transversely of the axis of the vehicle, an intermediate or countershaft, parallel with the motor shaft, chain wheels on the respective shafts, a chain embracing said wheels through which the motor shaft drives the countershaft, the shaft parallel with the motor shaft and in two aligned lengths or parts, balance gear connecting the parts of shaft, sprocket wheels on the respective lengths of the shaft, sprocket wheels on the respective hind wheels of the vehicle, and chains for driving connecting the respective wheels, substantially as set forth.

721,682. Reversible Galvanic Battery. Thomas A. Edison, Llewellyn Park, N. J. Filed Nov. 28, 1902. Serial No. 133,119. (No model.)

Claim.—1. An oxidizable element for a reversible galvanic battery employing cobalt, which is oxidized on discharge, substantially as set forth.

2. In a reversible galvanic battery employing an alkaline electrolyte, an oxidizable element therefor employing cobalt, which is oxidized on discharge, substantially as set forth.

721,705. Vehicle. Charles W. Hunt, West New-Brighton, N. Y. Filed Oct. 31, 1902. Serial No. 129,522. (No model.)

Claim.—1. In a vehicle, comprising a single, continuous body oscillating middle and rear trucks supporting and connected by said body and a forward steering-truck or body, the combination of a motor supported by the forward truck or body, a transmission shaft operatively connected with the motor and comprising several sections, universal joints connecting said sections in the vertical planes of the middle and rear axles, whereby oscillation of one axle with respect to the other is permitted, and intermediate gearing between the driving-wheels of each truck and the corresponding section of the transmission shaft, substantially as shown and described.

721,724. Steering-Gear for Traction-Engines. Warren F. McBeth, Paxton, Ill., assignor of three-fourths to N. E. Crothers, J. S. Dennis and Erwin C. Bogardus, Paxton, Ill. Filed Aug. 13, 1902. Serial No. 119,564. (No model.)

Claim.—1. A steering-gear comprising a toothed segment pivoted directly to a suitable support and designed to be located in rear of the front axle of a vehicle or machine, rods extending forward from the toothed segment for connecting the same with the front axle and pivotally connected to each of such parts, a transverse shaft having a worm meshing with the segment, and gearing for rotating the transverse shaft, substantially as described.

721,859. Automobile Steering Mechanism. Herbert H. Buffum, Abington, Mass. Filed Jan. 23, 1903. Serial No. 140,235. (No model.)

Claim.—1. In a vehicle steering mechanism a swinging ground-wheel, rotary steering mechanism connected therewith, a swinging rotary steersman's pillar, and toothed gears connecting said pillar and mechanism and thrown into and out of mesh by swinging movement of said pillar.

721,872. Explosive Engine. Anton Evensen, Chicago, Ill., assignor of one-half to Charles R. Hannan, Council Bluffs, Iowa. Filed Nov. 2, 1900. Serial No. 35,203. (No model.)

Claim.—1. An explosive-engine comprising a main cylinder having endwise reciprocatory movement, a piston in the main cylinder, a main frame having parallel guides for the main cylinder, guide lugs on the main cylinder having sliding engagement with said parallel guides, a crank shaft having oppositely extending cranks, bearings for said shaft rigidly attached to the engine-frame, and connecting-rods connecting the main cylinder and the piston with the cranks of the crank-shaft.

721,873. Sparking Igniter for Explosive-Engines. Anton Evensen, Chicago, Ill., assignor of one-half to Charles R. Hannan, Council Bluffs, Iowa. Original application filed Nov. 2, 1900. Serial No. 35,203. Divided and this application filed Mar. 11, 1901. Serial No. 50,617. (No model.)

Claim.—1. The combination with an engine-cylinder provided with a valve-casing, having a tapered valve-seat, and a slot opening from the valve-seat into the cylinder, a valve-plug which has oscillatory motion in the valve seat, an electric conductor extending through and insulated from the valve-plug and having a terminal which projects from the bearing-surface of the plug into the said slot, and a spring-terminal secured to the cylinder wall with its free end overhanging said slot in position for contact of the first-mentioned terminal therewith in the oscillatory movement of the plug.

721,876. Automobile. Frederick L. Fay, Holyoke, Mass., assignor to Samuel M. Green, Holyoke, Mass. Filed Jan. 20, 1903. Serial No. 139,728. (No model.)

Claim.—1. In an automobile, a front and rear axle, wheels carried thereby, a flexible body extending fore and aft and connected to said axles, the connection between the body and one of said axles being direct, a spring located between the other axle and the other end of said body, a motor carried by a yielding portion of said flexible body, and means for connecting said motor with the driving wheel or wheels.

721,912. Running-Gear for Motor-Vehicles. James W. Packard and William A. Hatcher, Warren, Ohio, assignors to Ohio Automobile Company, Warren, Ohio, a Corporation of West Virginia. Filed Mar. 10, 1902. Serial No. 97,431. (No model.)

Claim.—1. In a motor-vehicle, the combination of the driving-axle, the frame, two-part springs extending transversely of the axle, each spring being composed of a part connected to the frame and a part connected to the axle, said parts being movable rela-

Digitized by Google

tively to one another in the direction of their length, and longitudinally-adjustable stay-rods pivotally connecting the axle with the frame.

722,005. Sparking Igniter for Explosive-Engines. Charles E. Duryea, Peoria, Ill. Filed Apr. 3, 1900. Serial No. 11,313. (No model.)

Claim.—1. In an internal-combustion engine, an exhaust-valve and stem, a sparker journaled therein, an adjustable frame affixed to the sparker-stem, a spring for retracting the same, and a pawl carried by said frame, in combination with a yielding portion carrying said pawl and interposed between the cam-shaft and the sparker-stem of greater stiffness than the retracting-spring.

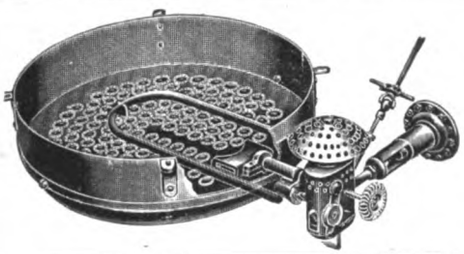
722,089. Change-Gear for Motor Road-Vehicles. Albert de Dion and Georges Bouton, Puteaux, France. Filed Sept. 10, 1902. Serial No. 122, 861. (No model.)

Claim.—1. In a change-gear for motor road-vehicles the combination of a shaft, a plurality of gear-wheels on said shaft, revolving therewith, a second shaft, a pair of clutches on said shaft, four gear wheels on said second shaft operated by said first-mentioned gear-wheels, means for shifting said last-mentioned gear-wheels relatively to said clutches so as to bring the first and third or second and fourth gear-wheels adjacent to said clutches, and means for operating one of said clutches independently of the other.

722,096. Traction-Engine. Benjamin T. Gibbons, Buffalo, N. D. Filed Aug. 29, 1902. Serial No. 121,502. (No model.)

Claim.—1. In a traction-engine, a motor thereon, a sprocket-wheel geared to said motor, a chain fixed at its opposite end and passing over said sprocket, traction-wheels for said engines, gearing therefrom to a motor, and means for shifting the driving power from the sprocket-wheel to the traction-wheel, substantially as specified.

722,146. Piston-Head. Archibald J. Robertson, Chicago, Ill. Filed Apr. 2, 1902. Serial No. 101,092. (No model.)



Claim.—1. In a piston for reciprocating engines, the combination, with a primary piston-head provided with an interior chamber and a piston-rod extending into said chamber, of a secondary head or disk rigidly attached to said rod to reciprocate within said chamber, and means for giving elasticity to the relative movement of said primary and secondary heads.

722,164. Fastening Device for Vehicle-Tires. Frank P. Stone, Chicago, Ill. Filed Mar. 27, 1902. Serial No. 100,323. (No model.)

Claim.—1. The combination with a channel-rim and a rubber tire-body seated therein and having its meeting ends longitudinally socketed, of fastening means for securely uniting said meeting ends of the tire-body, comprising a connection-strip secured centrally to, and disposed parallel with and slightly above, the base of the channel longitudinally thereof, said connection-strip being housed within the socketed meeting end portions of the tire-body, and means serving to unite the extremities of the connection-strip with the base of the channel and thereby clamp the base portion of the tire-body to the base of the channel beneath said connection-strip, substantially as described.

THE
PLEASURES OF AUTOMOBILING
WILL BE GREATLY ENHANCED BY THE USE OF

HARTFORD or DUNLOP
PNEUMATIC TIRES

The ORIGINAL and "MODEL" TYPES of SINGLE AND DOUBLE TUBE TIRE CONSTRUCTION

Appreciating the fact that requirements vary as to Single Tube and Detachable Tire Construction, we offer the most reliable of both types—*The Honest Standards.*

THEY WERE BEST YEARS AGO, AND YEARS OF INTELLIGENTLY PERSISTENT, CAREFULLY DIRECTED EFFORT HAS MADE THEM BETTER TO-DAY.

Where Quality is desired—where Comfort, Durability, and Protection against Annoyances is wanted—where All-'round Satisfaction is demanded—these tires should be adopted. Let us prove this to you by sending you signed statements from some of the most prominent makers and users in this country.

G & J TIRES

merit the attention of all who are looking for "the best tire" and will not be satisfied with anything else.

We make no noisy generalizations, which, like rockets, explode with much commotion, but end in nothing but vanishing smoke,

The proof lies in the unanimous verdict of satisfaction rendered by their users ever since pneumatic tires were first introduced, and in their great and constantly increasing use everywhere, which proclaims them to be of the highest quality that skillful workmanship and best material can produce.

"Only Known Values are Imitated"

Do not be misled by imitations. Demand the "G & J." and money will be saved by getting more wear with fewer repairs.

GOODRICH CLINCHER AUTOMOBILE TIRES ARE DECLARED "MARVELS OF WORKMANSHIP."

TELEPHONE, 6664-38TH

THE OLDSMOBILE CO.

138 WEST 38TH ST.

New York, Oct. 18, 1902.

THE B. F. GOODRICH CO.,

Akron, Ohio.

Dear Sirs:

As per our telegram the tires we used in the Endurance Run were perfectly satisfactory. The seams on the tread of these tires were visible when we returned, and there was not a cut or scratch of any kind to show that these tires had been used. We wish to thank you for the attention we received at the hands of the representative of your company throughout the entire Run. We were met at almost every control by someone who was interested in the welfare of your tires and ready to offer any assistance necessary in the care of them. We fortunately did not have to touch our tires from the time we left New York, which goes to show that they are marvels of workmanship. We are inclined to think that the double tube tire for a light machine, is the only proper solution of the tire proposition.

Again thanking you for your courtesy, we are

Very truly yours,

OLDSMOBILE COMPANY,

E. M. Swayze

THE 16-H. P. four-cylinder touring car shown above represents the best development in gasolene automobiles up to date. IMPROVEMENTS:—Throttle control from steering wheel, simplified sliding gear transmission (interlocking); all steel CHASSIS, allowing customer to order any desired body; valves removable in minimum time; spark-plugs connected to cables by chains, thus preventing snapping of wires. We make both 9 H. P. and 16 H. P. cars and employ the front vertical motor exclusively. Many other advantages. Write for full information.

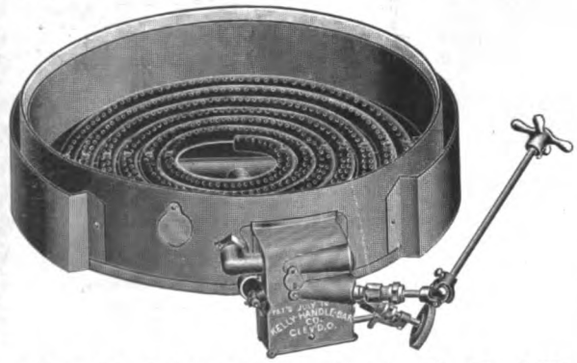
THE NEW



KELLY GENERATOR

for Steam Vehicles is a Trouble Saver.

No Steam Car is complete without one. Does away with drip cups and all annoyances. Perfected in every way and always reliable. Strongly made with all connections outside. Easily adjusted. No flaring or flashing in lighting, even in the strongest wind. Main fire controlled at seat. Compact and neat in appearance and enclosed in aluminum case.

ADAPTED TO ANY MACHINE

The New One-Piece Steel Tubular Burner

with entirely new casing. Has no gauze or holes in the bottom, the air being taken in from the ends. Absolutely eliminates all danger of fire under-lapping. As there are no air-tubes through the continuous stop-tube the burner even if red-hot cannot back fire. One of the most important improvements yet made. Thoroughly tested—as are all our products. Write for circular.

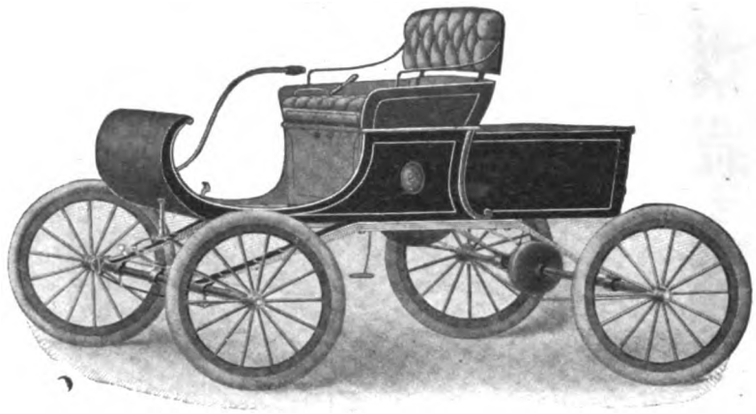
THE STEARNS CAR

Received a lot of very favorable comments at the show.



The style and general design is right. The motor is powerful, with a perfect throttle, and runs silently and with no vibration. The attachments on the dash and controls at the wheel are good points, too. The small tube radiator is ahead of the time, and considering all things, **STEARNS CARS are worth more than they cost.**

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, March 19, 1903. No. 25

INTEREST AT LAST AROUSED

N. A. A. M. Stirring and Assures American Industry's Fit Representation at St. Louis.

All doubts regarding a representative showing of American automobiles at the St. Louis Universal Exposition next year have been set at rest. The National Association of Automobile Manufacturers has steppel into the breach and practically taken upon itself to see that the exhibits from this country are in keeping with the importance and dignity of the industry. Neither France—whose makers have already taken steps to secure the space for an imposing showing—nor any other country will be permitted to over shadow the United States as until now has seemed likely. Sufficient assurances of support have been received from prominent makers to render this certain.

Although no charge is made for spaces, and it is the intention of the Exposition managers to give great prominence to this class of transportation vehicles, automobile makers have hitherto been apathetic. Efforts made to arouse their interest were entirely unsuccessful. It looked as though the section would be made up of foreign cars, with only a sprinkling of those of home manufacture. To prevent such an unfortunate contretemps, W. A. Smith, Chief of the Department of Transportation Exhibits, appealed to the N. A. A. M. and enlisted its active support. To the Motor World representative on Saturday, President Budlong, of the N. A. A. M., in answer to the question whether there was a prospect of these efforts being crowned with success, said:

"A very good prospect indeed. We have been in correspondence with our members, and the replies received leave no doubt, in my mind, that a sufficient number will consent to make a fine showing.

"You see, it is not a question of being a money making scheme. No concern would show at St. Louis expecting to secure a lot of business thereby. But it is something that we, as a nation, cannot afford to let come to naught. Patriotic motives, if nothing else, should actuate makers to exhibit. It would not do for us to let the French makers have the only respectable exhibits. Speaking for the Electric Vehicle Co., I will say that this is the view taken of the matter, and we wil act in accordance with it. So will a number of other makers, I feel sure, as they have so intimate in the course of the correspondence brought out by the N. A. A. M."

In its efforts to secure a fitting representation the N. A. A. M. is outlining a plan for lessening the expense while at the same time enhancing the benefits to be derived from the exhibits. Th association proposes to engage space at St. Louis and to look after the exhibits after they are staged. Competent attendants would be provided to explain the features of the different cars and to furnish any information concerning them that might be desired.

Exhibitors would not be obliged to make use of these attendants, however. They could, if they preferred, have their own men for the service, and in all other respects look after their exhibits in their own way.

Chicago Fixed for Five Years.

It seems evident that Mr. Samuel A. Miles means to retain the whip hand of the show situation in Chicago.

According to reliable private advices received this week the owners or management of the Chicago Coliseum have entered into a contract with him whereby there is secured to Miles for a term of five years the exclusive right to promote and conduct all functions in which automobiles are concerned which may be held in that building.

As it is the only structure in the city suitable for affairs of the sort, the contract makes plain that none will be held until Mr. Miles is "seen" and arranged with.

Suit Over Electric Welding.

The Thompson Electric Welding Co. has filed a bill of complaint in the United States District Court for Connecticut against the American Tube & Stamping Co., of Bridgeport, Conn. Infringement of a patent process of electrical welding is alleged, and an injunction and an accounting asked for.

Stevens-Duryea Price Advanced.

An advance in the price of the Stevens-Duryea gasolene car has just been made. The new price is $1,300, as against the $1,200 previously charged. The top and complete equipment are included.

MAY BE BUT ONE SHOW

Makers Association Disscusses and has Subject Under Advisement—Chauffeurs Also Considered.

Expressions of opinion, recorded in the Motor World at the time, regarding the results of the Chicago show, and indicating a feeling that in future there should be one national show held, and that at New York, have already borne fruit. The matter was brought up on Wednesday afternoon, when the executive committee of the N. A. A. M. met in this city. The suggestion to hold a single show here was made, and it was discussed at some length. Some members favored such a course, others opposed it. In the end the entire matter was referred to a committee of three, which will report at a future meeting.

The matter of securing an adequate showing of motor vehicles at the St. Louis Exposition was also referred to a committee of three. The committee already appointed to consider the chauffeur question was not ready to report. Consequently that matter went over also.

The meeting of the executive committee was preceded by a general meeting of the association. Its purpose was the consideration of changes in the constitution and by-laws. It had been reported that an important change relative to the associate membership would be made, but nothing was done in the matter. A number of unimportant changes, designed to bring the different sections into harmony and to remove some slight inconsistencies, were carried through, however.

Pardee Comes to New York.

Quite the most unexpected news of the week is contained in the announcement that Pardee & Co., the well-known Chicago dealers, have taken over the store at 317 West Fifty-ninth street, this city, and will be in charge of the Packard interests. Colonel Pardee will, for the time being, make his headquarters here.

MOST VICIOUS OF ALL LAWS

Pennsylvania Senator Proposes an Act That Makes a Burlesque of Justice.

Grim indeed are the provisions of the anti-automobile bill introduced in the Pennsylvania Legislature by Senator Grim. Under the specious guise of keeping the State highways as "free as practicable from the reckless use of dangerous motorvehicles," it embodies provisions that mark it as the most vicious statute yet proposed in any State.

It fixes the maximum speeds in the cities and country at eight and twelve miles, respectively, institutes licensing and registration bureaus, compels the filing of a $5,000 bond by non-residents wishing to take out licenses, makes the carrying of numbers six inches square compulsory, and places it in the power of the drivers of horses or other animals to stop autoists at their pleasure. The culminating outrage is the imposition of penalties for violation. A fine of not less than $500 and imprisonment for not less than thirty days in jail are obligatory; and the offending automobile is forfeited, its disposition resting with the Court. Informers are rewarded by a payment of $50 of the fine.

The principal provisions of the act follow:

Section 1—Be it enacted by the Senate and House of Representatives of the Commonwealth of Pennsylvania that no engine commonly called an automobile or other vehicle, whether propelled by steam, gas or electricity, shall be operated or driven upon any public highway in any city, borough, county or township in this Commonwealth, until the same has been registered by the owner or owners thereof in the Prothonotary's office of one of the cities or counties of this Commonwealth as hereinafter provided.

Section 2—Every applicant for registration shall set forth in writing the name and residence of the applicant, the name and residence of the owner or owners, the name of the manufacturer and the number of the motor-vehicle to be registered.

Section 3—It shall be the duty of the Prothonotary to issue a certificate of registration to the applicant or applicants, for which registration the applicant or applicants shall pay to the Prothonotary at the time of filing the application four dollars

Section 4—Every registration certificate issued must contain the name of the applicant or applicants, the name of the owner or owners, the name of the manufacturer and the manufacturer's number. The registration of such motorvehicle shall not be valid until the certificate so issued is posted in a conspicuous place on the motorvehicle so registered, and the registration number is posted in a conspicuous place on the front and back of the said vehicle, and the registry shall be null and void if the motorvehicle is used or operated upon the public highways as aforesaid when either the certificate or number is removed therefrom.

Section 5—No person shall be allowed to use or operate any such motorvehicle upon any of the public highways aforesaid until he shall have passed a satisfactory examination in the use, operation and construction of the same before the State Board of Highway Commissioners and shall have received a license from the Treasurer of one of the cities or Counties of this Commonwealth, as hereinafter provided.

Section 7—No person or persons shall be allowed to use, operate, or drive any motorvehicle as aforesaid upon any of the public highways of the cities, boroughs, counties or townships of this Commonwealth at a speed greater than eight miles an hour within the corporate limits of any of the cities and boroughs, and twelve miles an hour without the corporate limits of such cities or boroughs.

Section 8—Before such license shall issue the applicant shall take and subscribe an oath before the Prothonotary of the same city or county that he will not use, operate or drive any such motorvehicle upon the public highways aforesaid at a speed greater than eight miles an hour within the corporate limits of the cities and boroughs of the Commonwealth and twelve miles in the counties and townships without said limits. Before any such license shall issue to a non-resident of this Commonwealth the applicant shall, in addition to the other requirements of this act, file his bond in the penal sum of five thousand dollars with sureties to be approved by the Court of Common Pleas of the same county, which bond shall be in the name of the Commonwealth and shall inure to the benefit of all persons damaged in person or property by the use and operation of any motorvehicle while in the possession of the person licensed and for the payment of all fines and costs imposed for the violation of any of the provisions of this act. And successive suits may be brought thereon to the use of all such persons until the amount thereof is exhausted.

Section 9—No license issued as aforesaid shall be valid for a longer period than one year. They may be issued on the first day of January, or at any time thereafter, but shall expire on the thirty-first day of December next ensuing. The annual license fee shall be ten dollars, and shall be paid to the City or County Treasurer, for the benefit of such city or county.

Section 10—Every person using or operating a motorvehicle upon the public highways, as aforesaid, shall have displayed in a conspicuous place on the front and back of such motorvehicle, in large numerals, not less than six inches square, the number under which it is registered. He shall sound a gong or other alarm when approaching a street crossing or road crossing, shall have no right of way or preference as to the use of such street or road, but shall stop the motorvehicle when signalled to do so by the driver of any horse or other animal until the animal or animals have passed in safety.

Section 14—Any owner, lessee, bailor, bailee, operator or user of any motorvehicle as aforesaid, violating any of the provisions of this Act, shall, in addition to his, her or their civil liability, be deemed guilty of a misdemeanor, and upon conviction thereof shall, for each and every offence, be sentenced to pay a fine of not less than five hundred dollars, and to undergo an imprisonment in the county jail for a period not exceeding thirty days; Provided, that any such person or persons, convicted of violating the provisions of either of sections one, five or seven of this Act, the sentence so imposed shall work a forfeiture of the motorvehicle found in the possession of the person so convicted, and the Court shall make much order with reference to the disposition of the same as may seem to it just and proper.

Section 15—Any officer, when making such arrest upon his own motion, and any person giving the information leading to the arrest and conviction of any violator of any of the provisions of this Act, shall be entitled to receive fifty dollars of the fine so imposed, upon conviction.

Section 16—This Act shall not apply to any race course or private road, nor to any passenger railways or steam railroads confined to tracks, nor to steam or other street rollers, nor to any of the motorvehicles which any manufacturer or vender of automobiles may have in stock at his place of business or in his various warehouses.

New Jersey Bill Advanced.

After an unexpected check that sent the cold chills down the backs of those interested in the measure, the New Jersey automobile bill, termed the Scovel bill, has passed the Senate of that State on its second reading. It had already passed the House.

The check referred to came on Thursday of last week. The measure was reported with an amendment that emasculated it. It was the work of Senator Cross, of Elizabeth, and fixed the maximum speed of automobiles in the State at fifteen miles an hour. The bill provided for a speed of twenty miles. The change caused consternation as a matter of course, as it looked as if all the work of autoists had gone for naught.

By Monday, however, Senator Cross had been induced to listen to reason. He withdrew his amendment, and the bill was promptly given a second reading.

In the course of his speech in favor of the bill Senator Hudspeth, of Hudson, said:

"It is almost a perfect bill, and New Jersey will set the pace for fair automobile legislation if it is enacted into law."

Discord Over Florida Races.

There is discord in the camp of the Florida automobile race meet boomers. Late last week it was announced that the races scheduled to be held at Daytona on March 26 were off, positively and for all time. This week the report came from W. J. Morgan, who conceived the idea of the proposed events, that they are still "on," and will positively be run as scheduled. Definite entries from R. E. Olds and other well known autoists were stated to be in hand.

Some light is thrown on the matter by a letter from Secretary F. P. Hoover of the Florida Automobile Association, stating that on March 11 this association voted to withdraw from all connection with the race meet. This withdrawal was due, he said, to the fact that sanction to run the races had not been obtained from the American Automobile Association, although it was supposed that this had been attended to. Hoover added that as they could not hold the races according to the laws of the American Automobile Association it was deemed advisable for the best interests of the Florida Automobile Association to sever all connection with the meet.

THE CHAUFFEUR SITUATION

The Motor World's Ventilation of Subject Proves Timely and Brings Additional Opinions.

That the Motor World's exhaustive story of the chauffeur situation, published last week, was a revelation to many there is no doubt. Even those in the trade who were familiar with the conditions depicted were pronounced in their expressions regarding the accuracy and timeliness of the article, and of the purposes it would serve.

"The subject needed just such publicity and ventilation as you gave it," said one of the best known of the metropolitan managers, "and if we could get a copy of last week's Motor World in the hands of every man employing a chauffeur it would help mightily in solving at least several phases of the problem."

The publication of the story naturally brought out numerous instances of the cupidity, or worse, of the chauffeur ilk.

"One of the worst cases I know of," remarked a man in position to speak, "concerned an expensive car, owned by a wealthy man who went abroad with his family last summer, leaving his car in charge of his chauffeur, a well paid man. The owner could not have got far outside Sandy Hook before that precious driver began 'hacking it' with that costly rig. He must have turned a good many dollars into his pocket during the several weeks that his employer was absent, but 'slipped up' in rather an odd fashion. One of the last parties to which he rented the car was made up of Tenderloin rounders. They got gloriously drunk, and one of their drunken ideas of fun was to squirt the speaking tube, with which the car was equipped, full of tobacco juice. The chauffeur did not discover it, but the owner found it out on his return, and in a disagreeable manner more easily imagined than described, That chauffeur lost his job, of course."

"It should not be lost sight of that aside from the matter of commissions not a few of the abuses cited are directly chargeable to the owners of the garages," said another man. "It is their business to know or to discover the comings and goings of the cars which they are paid to care for. No car can leave their places without their knowledge during working hours or without the connivance of their night watchmen after hours, and the garage owners or managers who wink at such practices, or who even permit themselves to remain in ignorance of them should be run out of the business. It is their duty to know and to be loyal to the men who enable them to live. There is no doubt at all that some of the night watchmen are in league with the chauffeurs, and it is these so-called watchmen that require watching. I have good reason to believe that one of the most flagrant of the offending places in New York is also one of the most expensive and top-lofty. From all accounts, the chauffeurs and the night watchmen there are hand in glove, and it is not at all uncommon for three or four cars to leave the place at midnight with soubrettes aboard. I have been told, and I believe it, although I cannot vouch for it, that certain chauffeurs have been permitted to strip their employers' cars in the place and then repair to the Hudson County Boulevard, where they have almost weekly engaged in midnight races on that magnificent highway. If a system of espionage or of dropping in at unexpected hours is necessary discover such abuses it should be instituted. It is the one sure way of preventing it."

Chauffeurs to Organize a Club.

The matter of an organization of chauffeurs has taken another turn. The union plan has, as stated last week, fallen through, and in its place there is a proposition to form a club, the object of which is the remedying of some of the abuses complained of.

A meeting has been called to take place this week at the garage of the Mobile Co., at Forty-eighth street and Broadway, this city. Signatures of seventy-five chauffeurs are said to have been secured for the call. It is proposed, in case the organization is effected, to inagurate a registration system, dividing the men into four classes and issuing certificates for each. In the first class will be placed men who have had two or more years experience, in the second those with between one and two years' experience, and the third and fourth classes, those with less than one year's.

Seigman Loses his Suit.

At Trenton, N. J., last week, the Court of Errors and Appeals affirmed a decision of the Court of Chancery in the suit of Richard Seigman against the Electric Vehicle Co. The suit was brought to compel the directors of the company to pay back dividends alleged to have been illegally declared in 1899 and 1900. The suit was dismissed on the grounds that no application had been made to the directors to have them recover the alleged illegal dividends. Of the present directorate of the company of twelve members, there are only five who were directors at the time the alleged illegal dividends were declared. The court therefore holds that application must be made to the directors before any stockholder can institute suit.

Committee on Chauffeurs Named.

The N. A. A. M has, as the Motor World last week intimated would be the case, taken formal action on the chauffeur question. A committee has been appointed to consider the advisability of devising a plan for the schooling or training of men desiring to become chauffeurs, and to receive suggestions on the subject.. L. H. Kittridge, W. D. Gash and G. B. Adams comprise the committee.

On Saturday the last of the English shows opens. It will be held at the Agricultural Hall, London.

RULES FOR WAGON TEST

Classes Arranged and Requirements Outlined—How the Medals Will be Awarded.

The first draft or prospectus of the rules governing the Automobile Club of America's forthcoming commercial vehicle contest has been given out by that organization. Its salient features are, as already announced in these columns, the holding of a two day contest, to take place May 20 and 21, open to all types of self-propelled vehicles, whether of foreign or domestic origin.

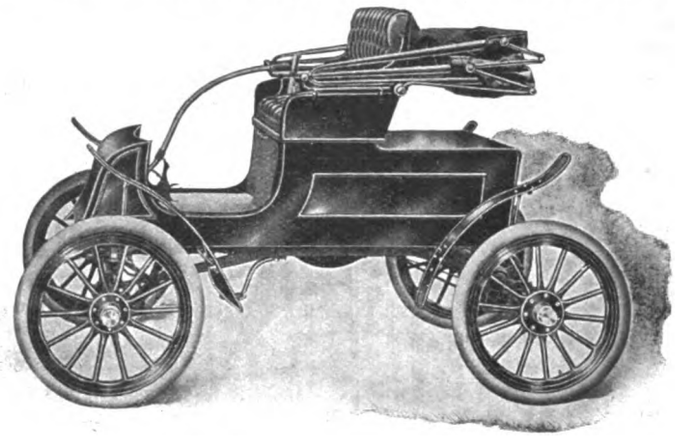
Two twenty mile runs each day will be made, starting from the clubhouse, Fifty-eighth street and Fifth avenue, proceeding to the Battery, thence uptown to the northern part of the city and back to the clubhouse, the route being covered twice. The first day's run is to be without voluntary stops; on the second day designated stops are to be made. One stop of not exceeding three hours' duration is allowed electric vehicles during each day's run for recharging batteries. Steam vehicles are permitted a thirty minute stop for water.

As previously stated, the vehicles are divided into three classes—electric, steam and gasolene—with four subdivisions, based on weight. It is stipulated that each vehicle shall carry a dead weight of at least 75 per cent of its own weight, in addition to the driver and an observer, who shall accompany each vehicle. The subdivisions are for vehicles carrying loads of 750, 2,000, 3,500 and 10,000 pounds, and on the second day's run they shall make 100 stops for the first and second classes, and twenty and ten for the third and fourth. Gold, silver and bronze medals are to be awarded to the vehicles in the four classes making the best showing. The basis of award is economy of operation and time consumed in covering the course within the legal limit of eight miles an hour.

Contestants are permitted to carry their loads either in live or dead weight; but must submit their vehicles to the club for weighing, both before and after loading. A record will be kept of the amount of gasolene, electricity, coal, etc., consumed, so that the cost of operation can be ascertained. Ampere-meter and volt-meter readings will be taken one each day, and before and after recharging.

The contest committee announces that a complete set of rules, under which the contest will be run, will be issued later.

Colors for Cup Teams.



At a meeting of the sport committee of the Automobile Club of France, held last week, on the proposal of the Automobile Club of Great Britain it was resolved to adopt the following distinguishing colors for the Bennett Cup race: Great Britain, emerald green; Germany, white; America, red; France, royal blue.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y, Post Office, November, 1900.

NEW YORK, MARCH 19, 1903.

Disgracing Pennsylvania.

Even in the business of law manufacture there must be what the vernacular terms "the limit." If the Grim bill, introduced in the Pennsylvania legislature by the "statesman" of that suggestive name, is not "the limit." If the Grim bill, introduced is difficult to conceive to what greater lengths it can be carried, save only by the prohibition of the use of motor cars on the road.

The bill in full is reproduced in another column. It deserves a place in all scrapbooks as a legislative curiosity, as evidence of legislation run stark mad. It is impossible to accept it seriously.

Grim is either a prince of jokers or his head is sadly in need of examination. His bill is a serio-comic effort that would wring tears from the angels. It is also a disgrace to the State of Pennsylvania and to the man or men responsible for it. If by any contretemps it should get beyond a first reading, Justice might well throw her scales into the sewer and don the cap and bells of the buffoon, the eagle might well cease to scream and Uncle Sam exchange the read, white and blue for deepest black and no longer prate of "the home of the free."

If Grim has heirs, the pity is for them. When a few years or a generation hence they look back and view the miserable mess of legislative pottage which the shortsighted and unprogressive "old man" spilled on the family name and on the State of Pennsylvania they may well hang their heads.

Grim would have automobilists make oath that they will not exceed the limits of speed which he sets. Automobilists might have Grim make oath that he is not a fool, and even then we are not certain that they would not have good grounds for perjury proceedings.

Will Spark Plugs be Revolutionized?

That a revolution in spark plugs is probable there is small room for dispute. The discovery of the amazing virtues of the outside gap and visible spark make inevitably for that end.

The "wise men" are telling us that it is really no discovery at all. But the fact remains that none of these wise ones, despite his alleged knowledge, turned it to advantage, although every betterment of existing ignition systems was eagerly sought and earnestly desired. The "outside gap" will stand as a discovery despite fulminations to the contrary.

That it should be applied by means of an extraneous attachment only when a plug had become foul appears illogical. If it is good at any time for any plug it should be good at all times for all plugs, and plugs should be so altered or hereafter so constructed as to integrally incorporate the double-jump feature; extraneous devices should be made unnecessary.

When the only point on which doubt exists is removed, i. e., whether the outside or extra spark does or does not make added or undue drain on the life of the battery, there is no doubt that the future construction of plugs will be quickly settled.

If it is proved that undue drain exists the attachable "interrupters" or "intensifiers" will prevail, and for use when a plug grows wrong will become not less valuable than a tire repair tool or tool of any kind. If it is found that the extra and hotter spark affects the life of the batteries little or not at all, then there is no reason why the necessary "interruption" should not be made a part of the plug itself.

The value of the discovery appears not to have been fully realized by the rank and file. But that does not diminish its importance. The means that not only enables a sooted or oil covered plug to spark perfectly—and we have known a cracked plug also to be made work as well—without removing it from the motor, but that affords visible proof that batteries and coil are "delivering the goods," is no small improvement and perfection of the weakest link in the, so to speak, gasolene chain—the ignition system.

Classes in the Commercial Contest.

America's first commercial vehicle contest will be an event vastly different from the first organized contest in which the pleasure vehicle participated. Many changes have taken place in the year and a half that has elapsed since the Automobile Club of America conducted its Buffalo function; and a deal has been learned about planning and carrying through successfully such tests as those under notice.

Consequently the skeleton rules given forth by the contest committee of the A. C. A. appear to answer the purpose admirably. Elaboration will probably result in smoothing out any rough places and remove such discrepancies or misunderstandings as may exist.

For example, it is provided that steam vehicles will be "allowed thirty minutes stop for water." Whether this is restricted to one stop as well as to thirty minutes is not clear. Again, no provision is made for hybrids—vehicles using both explosive engines and electric motors. They will probably be looked after. Just what constitutes an involuntary stop, and how much allowance should be made for traffic congestions resulting in stops and delays are also matters requiring careful consideration. The same may be said of such other matters as repairs—by whom and where they shall be made— and tires—whether stops due to them shall be penalized. These are details, however, and will unquestionably come in for careful attention.

The classification of the cars at once attracts attention, and even calls for explanation. On the face of it, the "dead load" must be exactly 750, 2,000, 3,500 and 10,000 pounds. The basis of the division is found in the note that "each vehicle must carry a dead load of at least 75 per cent of its own

Digitized by Google

weight in addition to the driver and observer." Now, let us see how that works out: We will suppose that a light delivery wagon weighs 1,100 pounds—or any number over 1,000. As it must carry at least 75 per cent of its own weight, or more than 750 pounds, it is ineligible to the first, or 750 pound, class. It must, therefore, go into the second class and carry 2,000 pounds, or nearly double its own weight.

The hardship of this will readily be seen. Furthermore, there are very few even of the light delivery wagons that will not scale more than 1,000 pounds. As a result, the first class is almost wiped out. An even greater injustice is done in the case of a vehicle weighing, say, 4,800 pounds. With a 75 per cent load it must carry 3,600 pounds, or too much for the third, or 3,500 pound, class. It would, therefore, go to the next class and carry 10,000 pounds, or more than twice its own weight.

The matter of classification is plainly one that is in need either of revision or elucidation.

Tire Improvement.

We need only go back a couple of years to reach the time when pneumatic tires were very far from being satisfactory to automobile users. To institute a comparison between then and now is all that is necessary to perceive what a great change has come about; and this without overlooking the fact that the air tire is still far from being perfect.

In bringing about this change two factors have been at work. The first is the immense improvement that has taken place in the tires themselves. Experience—some of it very costly—has shown the makers the defects of their former product, as well as enabled them to correct them. Better fabric, better methods of rubber compounding, coupled with improved designing, have combined to produce tires that last longer, wear longer and stand up better under hard usage than anything that was formerly turned out of the rubber factories.

Side by side with this movement has gone another of scarcely less importance.

The tire user—and under this term is comprehended the maker as well as the purchaser of the complete automobile—has learned his lesson, at least in part. He is now willing to leave something to the tire maker's judgment. Instead of ordering tires of a certain size at a specified price, and then fitting them to suit himself, he asks the advice—or takes it, which amounts to the same thing—of the tire maker, and is guided by his experience. Consequently he does not use 2½-inch tires on touring cars, or expect thick fabric, puncture resisting tires to prove satisfactory on light runabouts.

Consequently it is no exaggeration to say that pneumatic tires now occupy an unassailable position in the automobile trade. No one seeks to displace them—at least on pleasure vehicles—and for a very simple reason: they have no object in doing so, being satisfied with them as they are.

The Cup Race in Ireland.

Apparently the Bennett Cup race on Irish soil is as good as an accomplished fact. The bill to legalize it has passed a second reading in the British House of Lords, and the making of preparations for holding it is being gone ahead with. Humanly speaking, therefore, no doubt whatever exists about it.

It is just possible that lack of familiarity with automobile racing may cause some accidents to result. The conducting club suffers in some degree on this account, while the Irish populace, unlike the French, are profoundly ignorant of the terrible possibilities inherent in the speed monsters that will invade the Emerald Isle in July, and it will be no easy matter to keep their curiosity in check. Still, the effort will be made, and the thorough manner in which it is being gone about makes it reasonable to suppose that it will be crowned with success.

On the day of the race the course will be thoroughly patrolled and guarded. It is even proposed to call in the military to aid the Automobile Club of Great Britain and Ireland and its deputies in preserving a clear course; but this is a rather remote contingency.

A strict interdict has been laid on the reckless and indiscriminate use of the roads for practice prior to the race. When we recall that the indulgence in such practices resulted in the prohibition by the Italian authorities of the road race from Nice last year, the wisdom of such a ban will be readily understood.

This year, for the first time, the Bennett Cup race will be an event of the first magnitude; one thoroughly in keeping with the conceptions of the donor of the cup. Prior to the 1902 race the event was of secondary importance. Even last year it was dwarfed by comparison with the Paris-Vienna contest, being run in conjunction with it, and being provocative of interest chiefly because the cup was, for the first time, wrested from the French club which had held it from the beginning.

The 1903 race marks a new era. The race is to be run alone, over a course especially selected and used only for this race. The contestants, officials and visiting spectators will go to Ireland to see this race, and at its conclusion will disperse, their labor or pleasure at an end. And for the first time also the competing teams will be representative and "classy." France, Germany and the United States will all send teams to wrest from Great Britain the trophy emblematic of speed supremacy on the road which the latter will then have held for a year. The cars will embody the latest and most approved principles of construction, power and speed being the prime considerations; and the men who will drive them are the recognized giants of the automobile racing world. It will be a veritable battle of Titans, one well worth going a long way to see.

In these many proposed licensing schemes it sounds pretty to say that a man's license shall be taken away or suspended under certain conditions, but we are impressed with the idea that it is more sound than substance. Arrests may be made as often as occasion requires, but to deny the public highways to any citizen using a legitimate vehicle savors strongly of a flagrantly unconstitutional blow at personal liberty.

It is evident that the space filling fakir has fairly inaugurated his spring campaign. By "landing" several big New York dailies with such palpable fakes as were the "Woman's Automobile Club" and the "New York-Chicago race" he has certainly made a good beginning.

The Subject of Rear Lights.

Editor The Motor World: Your article in edition of the 12th inst., relating to "Road Rules," in one point hits the nail on the head. Every man who runs an auto at night, and every club, should undertake to bring all their influence to bear on our lawmakers to the effect that every vehicle on the road at night should carry two white lights facing front and at least one red light facing to the rear. What is sauce for the automobile is sauce for every other vehicle.

I believe this to be one of the most important promoters of safety to all who may ride at night. The interests of those who ride are mutual, and will be best served when all show a liberal spirit, governed by old fashioned common sense—P. M. BERRY, New York.

BOSTON DOES ITSELF PROUD

Its Show a Model of its Kind and Proves a Huge Success—Several new Cars Shown—"Mottoes" on the Wall.

Boston, Mass., March 17.—This classic town is having an automobile show that is almost a classic of itself, and it is being held in a classic building, the new Symphony Music Hall, at the corner of Huntington and Massachusetts avenues. It is a sufficient and satisfying show. It is so spectacularly beautiful and so nearly complete that it seems a slight to term it a local show, yet such it distinctively is, for the names on the signs about the hall are almost without exception those of local dealers, although most all the representative makes of domestic cars are on hand, and a couple of imported varieties.

The promoters, the Boston Automobile Dealers' Association, have reason to be proud of their show, and Bostonians well can be content with the local exhibit as a substitute for a trip to the national display at New York. It would seem also that a great many were of this mind, for the show is proving itself a fine success in point of attendance.

It was 8 o'clock on Monday night when the show was formally opened, and at that hour, even in the self-contained, calm minded Boston, there was a crowd of more than one hundred waiting for the doors to be opened. Within half an hour the place was crowded. The aisles of the main hall are wider than were those at the Madison Square Garden show, and, the spaces of the exhibitors not being divided one from another by railings, offer opportunity for a more general distribution of the crowd, yet at 9 o'clock on the opening night it was difficult to move about. The place was uncomfortably warm, and for the working men of the press to get about and get information from exhibitors was impracticable. They, were all too busy talking to prospective customers. Some of them were customers, for business began "right off the reel," and there is every promise of a week of highly gratifying sales. There is nothing mean about this show. It is handsome in every sense of the word. The managers and the press agent deserve great credit. If it be that the house was papered on the first night it was done with rare discrimination and tact, for the crowd present represented considerable of the smart set of the city. Handsome theatre waists and opera cloaks on the women and evening dress for the men were so much in evidence as to be almost the rule. By an actual tally made all but two of the fifty-four men in charge of exhibits were in evening clothes.

There is something remarkable about the prettiness of the show when it is analyzed, for there is little or nothing of decoration. It is artistic, that is all. The building itself is a setting that would make any imitation seem to be a gem. The main hall seems to have the two great galleries for cornices, while the grand alcove of the stage, with the gilded pipes of massive organ at the back, form a picture of architectural beauty of themselves. Above the second balcony from niches that alternate with arched panel spaces there look down upon the scene gigantean replicas of classic statuary. All the patrons of art and music apothesised by the Greeks are here, staring, stoney-eyed upon the most modern chariot of man. At the rear end of the hall in three panels flanked by Dian and Demosthenes are inscriptions in latter day newspaper English, designed to fit the occasion. These are:

"Sanitary laws do not permit the keeping of cows, sheep or pigs within the city limits. This will soon apply to horses also. Keep the animals in the country, where they belong."

"In ten years there will not be a horse drawn vehicle in Paris.—(Extract from a recent speech made by Baron de Rothschild."

"An automobile going twenty miles an hour is safer than a horse walking. The auto can't run away."

There are no elaborately decorated spaces. The signs above the spaces are on a uniform level, and in a harmonious tone. They are nearly all painted in gold yellow on an olive hued background. The flooring at every space is covered with dark green matting. The only electric signs are those over the stage—De Dion, Toledo and Waverly, besides the Darracq sign in the tuning room.

The officers of the promoting Association are: Kenneth A. Skinner, president; W. E. Eldridge, vice president; W. I. Campbell, secretary; A. P. Underhill, treasurer.

Although no machines were admitted to the building after 12 o'clock noon on Monday it is noteworthy that everything was in apple pie order at night, and that the show had a completeness that is unusual for first nights. Only a few cars remained to be installed on the second day, and most of these got in early this forenoon. The impending strike on the New York and New Haven Railroad has deterred some from shipping cars because the railroad refuses to guarantee to delivery. In one case it was decided to send up a car for demonstration work—a Locomobile—from the factory at Bridgeport by road, and it is now on its way. The opening attendance was generally placed at 3,000 or more, and 2,500 is a conservative estimate.

While the Salem Cadet Band played popular and classic music inside a hall with such remarkable acoustic properties that the orchestra, although a good one, made a din, there was outside from a dozen to twenty demonstarating cars humming a lively commercial tune of their own. The sign of business was that the demonstrating cars had plenty to do. In fact, the scenes outside the building are, size considered, comparatively as lively as those outside of the national show. From to-day on till Saturday night the show will be opened from 2 to 10 p. m.

It being an exhibition for the people and not for agents, the hall is almost devoid of human life in the forenoon and the morning of the second day there came a chance to look around and size up things.

A tally of the spaces made by the Motor World man to-day showed the following result: There are 55 exhibitors, of whom 35 are showing motorvehicles. Of these 35, two show motorbicycles and no cars and one of these hase both the motor and motorless style of bicycle. The 35 exhibitors have on view a total of 97 vehicles, which includes 10 motorbicycles. In motive power the 97 vehicles are divided as follows: Gasolene, 70; electric, 10; steam, 17. In variety of make, the 97 vehicles are of 53 different kinds. In style of carriage they are divided as follows: Runabouts, 37; tonneau, 35 chassis, 6; broughams, etc., 7; bicycles, 10; delivery wagons, 2.

Here is a summary of the exhibits as they are distributed in the building:

STAGE.

K. A. Skinner, Boston.—Two American made, 5 horsepower De Dion-Bouton motorettes, one French 6 horsepower voiturette, with cylinder under a hood in front, one 5 horsepower French rockaway, one 5 horsepower brougham and one French 9 horsepower tonneau.

W. E. Eldridge, Boston.—Two Toledo tonneau cars, one Waverly electric tonneau (a new model), one Cadillac tonneau, one Waverley electric delivery wagon, and three Waverley electric runabouts.

MAIN HALL.

Coates Manufacturing Co., Boston.—One Commonwealth runabout.

A. J. Coburn & Co., Boston.—Two Crestmobile runabouts.

A. R. Bangs, Boston.—One Franklin four-cylinder runabout, one General tonneau.

Automobile Headquarters, Boston.—One Pierce tonneau, one Pierce stanhope.

Harry Fosdick, Boston.—One Winton touring car, one Winton chassis.

Waltham Manufacturing Co., Waltham.—One Orient buckboard.

F. J. Read, Boston.—One Yale tonneau.

Pope-Robinson Co., Hyde Park, Mass.—One Pope-Robinson tonneau.

Upton Machine Co., New oYrk City.—One Upton tonneau.

A. E. Morrison, Boston.—One Peerless tonneau, one Peerless chassis, one Baker electric runabout.

Locomobile Co., Bridgeport.—One Locomobile steam surrey, one Locomobile gasoline chassis, two steam runabouts.

Stanley Motor Carriage Co., Newton, Mass.—Two steam runabouts, one steam surrey.

H. B. Shattuck & Son, Boston.—One Autocar tonneau, one autocar chassis, two Packard tonneau, one Searchmont tonneau, one Olds runabout, one Olds coupe, one Olds chassis.

Drisko & Snow, Boston.—One Reber tonneau, one American runabout.

Columbus Automobile Exchange, Boston.—One Rambler runabout.

Bates Bros., Boston.—One Mobile runabout, one Mobile surrey, one Mobile delivery wagon, one Conrad tonneau, one Conrad runabout, one St. Louis runabout, one Kensington tonneau, one Thomas tonneau, one Auto-bimotor bicycle.

Alvan T. Fuller, Boston.—Two Northern runabouts, one Northern chassis, one Orient motorbicycle.

H. E. Marvel, Boston.—One Columbia elec-

Digitized by Google

tric surrey, one Columbia electric victoria, one Columbia electric cabriolet, one Columbia electric coupe (operated from inside).

Crompton Motor Carriage Works, Worcester, Mass.—One Crompton steam cabriolet.

F. E. Randall, Boston.—Two Stevens-Duryea runabouts.

Barber Manufacturing Co., Somerville, Mas., and Eclipse Automobile Co., Somerville.—Eclipse steam runabout fitted with Barber kerosene burner.

F. E. Randall.—Four Indian motor bicycles.

Reed-Underhill Co., Boston.--One Knox runabout.

Diamond Rubber Co., Akron, O.—Diamond single tube and detachable tires.

Imperial Rubber Co., Franklin, Mass.—Tires with core of rope.

VESTIBULE.

American Darracq Co., F. A. La Roche, New York.—Two Darracq tonneaus, one Darracq chassis, two Cleveland tonneaus.

Waltham Automobile Co., Waltham, Mass.—One Waltham steam runabout, one steam surrey.

Electric Storage Battery Co., Philadelphia.—Exide batteries.

Charles E. Whitten, Lynn, Mass.—Two Stanley runabouts, one Rambler runbout, one White steam touring car, one steam stanhope.

E. H. Corson, Boston.—One Corson motor tandem, two Mitchell motorbicycles, one Merkel motorbicycle.

W. E. Eldridge, Boston.—One Columbia motorbicycle, seven pedal driven bicycles.

Tennant Auto Tire Co., Springfield, O.—Tennant puncture proof tires.

Waltham Manufacturing Co., Waltham, Mass.—One Orient runabout.

R. F. Kelsey, Boston, Mass.—One Racine motor launch.

Twentieth Century Manufcturing Co., New York.—Twentieth Century lamps.

Haverhill Fire Appliance Co.—"Eclipse" dry dust fire extinguishers.

Standard Anti-Friction Equipment Co., New York.—Beasley tires.

Beau-Chamberlain Manufacturing Co., Boston.—Hudson bicycles.

NORTH CORRIDOR.

H. H. Buffum Co., Abington, Mass.—One Buffum tonneau.

A. Shuman & Co., Boston.—Automobile clothing.

Automotor Co., Springfield, Mass.—One Automotor tonneau.

Lozier Motor Co., Plattsburg, N. Y.—Four Lozier motors for launches.

SOUTH CORRIDOR.

E. N. Bliss, Attleboro, Mass.—Jones speedometers, batteries and supplies.

The Frictionless Roller Bearing Co., Boston.—Bearings.

Westinghouse Electric and Manufacturing Co., Pittsburg, Pa.—Motors and equipments.

American Coil Co., West Somerville, Mass.—Induction coils and spark plugs.

Edwin L. Smith, Boston.—I. M. C. steering check.

Renault Car Co., Boston.—Two Renault tonneaus.

Jones-Corbin Co., Philadelphia.--One Jones-Corbin runabout.

TUNING ROOM.

Keasby-Mattison Co.—Asbestos automobile houses.

As will be seen from the summary W. E. Eldridge and Kenneth Skinner have the whole stage, and with their three electric signs these are the most conspicuous displays in the building. In point of number and variety of machines, though, the Bates Bros'. exhibit with nine vehicles of five different makes is the largest exhibit.

The hall lights up so brilliantly that there is no need for decoration at the spaces, and the only stand where any attempt at such a thing has been made is that of Drisko & Snow, where three tubbed palm plants are. One more electric sign arrived on the second day. It was that of the Oldsmobile Co., showing an Olds runabout outlined by varicolored incandescent lamps. There are a few new and some semi-new things at the show, besides a number of exhibits that are novel in Boston. The semi-new things are those that have been heard about and pictured, or perhaps seen in private, but never at a show, such as the De Dion voiturette, of six horsepower, with a wheel steering gear and a single cylinder engine under a hood in front, which Kenneth Skinner calls "Le Populaire," the Waverley electric tonneau, the Buffum touring car, the Columbia 1903 motor bicycle, the Corson motor tandem, the Eclipse steam car with kerosene burner, etc.

A real new vehicle here shown for the first time is the Crompton steam cabriolet. This is striking a production.

The Crompton people have been at work on the car for three years, and they have certainly turned out something unusual and engaging. To begin with, it is a heavy carriage with beautifully carved lines somewhat suggestive of the sweep of the Duryea car from the seat to the front. It stands upon large sized wooden wheels and has a capacious seat equal to accommodating three persons. To the eye it is a luxurious and simple looking vehicle. Two little gauge clocks on the dashboard, a brake pedal and the steering wheel are the mechanism there is in evidence, for there is no water glass and the exhaust pipe is under the body of the car.

The boilers and the engine are set compactly in a rear apartment. The boilers are distinctly novel and not easily described. There are two and at the same time twenty-four boilers. The two main boiler divisions are on each side and each of them is made up of twelve smaller distinct tubular boilers with nineteen fire tubes apiece, each set of twelve boilers being set under an individualizing top plate. The engine is located between the two boiler divisions. It is a four cylinder, sixteen horsepower rotary valve engine, geared direct to the rear axle by means of a vertical shaft and bevel gears at the transmission end. The differential gears are directly inside the beveled transmission gear on the axle. Another feature is that of hub brakes on the rear wheels. The virtue claimed for this construction is that of getting a great deal of heating surface and carrying a quantity of dry or superheated steam. The water gauge is dispensed with by using an automatic pump ingenious, yet simple, that is confidently relied upon to keep the water in the boilers constantly at the same level. This and an air pressure pump are claimed to have been so thoroughly tested that no hand pumps or gauges are necessary. There are two gasolene tanks in front of the dashboard, one holding nine gallons, the other six gallons. The water tank with a capacity of 40 gallons, is of corrugated copper and located under the seat. The engine is said to develop sixteen horsepower and a distance of fifty miles is claimed to be possible without stopping for water. The weight of the vehicle is stated as "in the neighborhood of 2,000 pounds."

The 1,600-pound Reber car, made at the old Reading factory, is a substantial, practical looking vehicle with a well constructed two-cylinder engine of twelve horsepower, a roomy tonneau and wide door.

The De Dion voiturette is the new type that has proved so popular in France at $7 00 that the Olds Company recognize it as their only rival. Here it is listed at $1,200, but it is a handsome, serviceable looking machine that impresses one as being worth the money.

The Waverley tonneau is as stylish a looking vehicle as one would care to find. It has graceful lines throughout, is roomy and luxuriously upholstered. The battery, composed of forty Exide cells is swung under the center. The car weighs about 2,500 pounds, will carry six persons, run forty miles on a charge, and yet it sells at $1,800.

A new thing in the sundry line is "Ideal Roller Bearing." The construction is not shown, but a wheel that runs "sweetly" is kept turning by means of a small electric motor.

Another new thing shown here is the Saylor Core Tire. The tire looks like pneumatic stuffed with cork or pressed fibre, but it is moulded about a core of rope. Several patterns are designed for making, one of them having a small core that does not fill the interior, but leaves a pneumatic chamber in the upper part of the tire in a way similar to the Munger tire.

Tires and puncture prevention devices have almost a monopoly of the side show features at this exhibition. A puncture preventer shown consists of a piece of metal, somewhat like a brake speen, that flaps lightly against the surface of the tire, being pendant from a rigid arm that is fastened to the side of the body of the car. The upper edge of this spoon piece is cut with saw-like teeth and as it is demonstrated at the E. N. Bliss stand, one can watch it pull tacks from a revolving Goodrich tire.

The Diamond tires, shown at a space in the main hall near the vestibule, are the only ones representative of the big tire makers. Wm. T. Halfer, the Boston manager, says that the remarkable record of the Diamond detachable is being improved. He has caused fifteen sets of them to be specified on cars ordered since Monday night.

Only a few of the exhibitions are giving any demonstrations. Gasolene is not allowed to be kept in the building, and the Oldsmobile is the only engine being run by an electric motor. A man is kept busy at the Shattuck space showing Olds chassis with its sectionally cut cylinder, explaining the parts and demonstrating the simplicity of the speed changing and reversing device.

The crowd on the second night was not of the dimensions of that on the opening night, but the hall was well filled, and the social character of the attendance was well maintained.

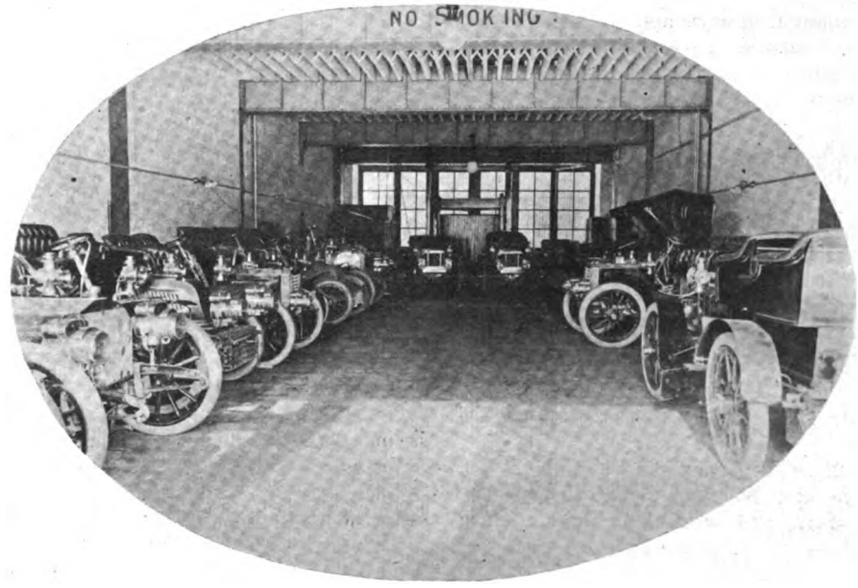
The Metropolitan Salesrooms and Garages—II.

It is quite natural to find that the finest automobile stations in New York City are numbered among those recently established. Although it is not one of the very latest places to be opened and is not so commodious as several others yet to be exploited in this series, the establishment of Banker Brothers, at 141-143 West Thirty-eighth street, is undeniably the handsomest and showiest combination of sales and storerooms in the city at the present time.



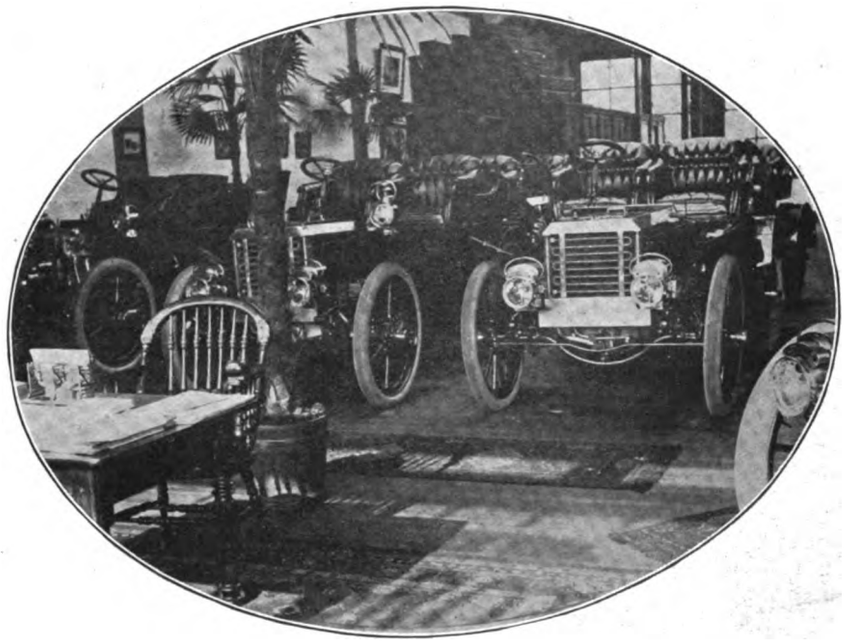
A magnificent expanse of plate glass, behind which can be caught glimpses of new Peerless touring cars and other vehicles, set off by tubbed palms, attracts the eyes of passersby on Broadway in the day time, while at night the whole place is resplendent in a blaze of electric lights. The edges of the windows are completely studded with incandescent lamps, to the total number of 159, and there is besides a big arc light overhanging the sidewalk. No pedestrian travelling along Broadway can fail to be attracted by the brilliant display that this place makes at night. It has a front that commands attention. The interior is quite in keeping with the outward magnificence. The fittings and furnishings are all new, thorough and arranged with an eye to convenience and style. The furnishings are handsome and the decorative effects in the way of palms and pictures bespeak both enterprise and good taste. There is good excuse for Banker Brothers to style their establishment an "Automobile Palace," and the New York manager, C. G. Wridgway, combines the faculties of being able to keep up the stylish tone and beauty of the place and yet make it a very busy workaday garage.

The building is two stories in height, with a frontage of 40 feet and a depth of 100 feet. About forty cars can be accommodated on each floor. Peerless, Waverly, Pierce, St. Louis and Century are the lines handled, and in the hands of Manager Wridgway they are all selling well. The demand for the Peerless cars is already threatening the supply. The firm has contracted for seventy Peerless cars, to be delivered by May.

Both renting and storing are done at the "Palace," and there is no hour of the night when the lights are not burning and men on hand to respond to customers. There is a handsome waiting room for ladies, a suite of fine offices and a stock room on the second floor, which resembles a conservatory because of the entire front and rear being of glass, a big, broad gabled skylight extending the length of the roof and of the floor, being set off with rugs and palm trees.

The stock room is laid out with the systematic thoroughness one might expect in a place so well appointed. There are bins, large and small, for parts of every description and almost every make of car, including some of foreign make. The repairing is not done at this station, however, but at the branch store, at 50 West Forty-third street, where also the overflow of storage is cared for, and by the use of telephone the

THE GROUND FLOOR, LOOKING FROM THE ENTRANCE.

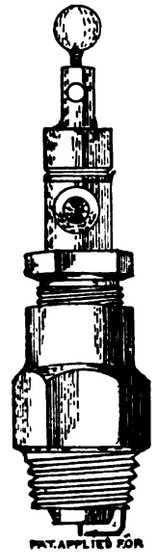


Digitized by Google

cars are as promptly available as if all in one place.

There is a fine charging plant on the ground floor, and an elevator, large enough to accommodate any touring car and capable of carrying 4,000 pounds, runs from the cellar to the roof. This lift, the charging plant and the electric lights are all run by a thoroughly equipped plant in the cellar, of which a 26 horse-power Foos engine is the base of power. Besides the 159 incandescents and the arc light outside, there are sixty incandescent lamps and seven arc lights inside, but all are run by the plant owned by the firm.

About thirty men are employed about the place. There are constantly from forty to eighty cars on hand, and there is always a busy stir on the main floor. Manager Wridgway is an automobilist of wide experience, who is equally at home conversing with a customer of the gentler sex in French or plunging into the bowels of a car with tools and oil can in hand, for he is a thorough mechanic and, having lived in Paris, speaks the Gallic tongue like a native.



In all, the "Automobile Palace," as conducted, is an establishment that does credit not only to New York, but to the whole industry.

THE BE-PALMED SECOND FLOOR

Here's the Double-Jump Spark Plug.

If by the use of an attachment providing an interruption of the circuit and a consequent external gap to be jumped by the spark, a fouled or disabled plug can be made to render perfect service, that the attachment would be dispensed with and the interruption be made an integral part of the plug itself, doing duty at all times, has seemed both logical and inevitable.

A plug incorporating the very idea has made its appearance, and was placed on the market early this week by the National Automobile Supply Co., No. 717 Nineteenth street, N. W., Washington, D. C. It is shown by the accompanying illustration. The plug does not differ from the usual save in the interrupter midway in the porcelain shank, the two points forming the gap being clearly shown. The Washington originators claim to have tested the plug in the most trying stress of actual use on the road, and with unfailing good results. Aside from rendering it possible to observe that battery and coil are doing their work, they state that it has defied all accumulations of soot, and that the increased intensity of the spark has fired mixtures which the single-jump plug has failed to ignite.

Recent Incorporations.

Buffalo, N. Y.—Morlock Automobile Mfg. Co., with $50,000 capital—Directors—J. F. Morlock, H. J. Wagner and J. L. McGrane.

New York, N. Y.—Manhattan Motor & Power Co., with $25,000 capital. Directors—J. N. Stout, G. W. Grossman and Frederick P. Schenck.

Tappan, N. Y.—Empire Automobile Photo Co., with $20,000 capital. Directors—R. W. Albert, C. H. Pennoyer and W. G. Bowdoin, of Brooklyn.

Groton, Conn.—The Cruikshank Motor Co., with $2,400 capital. Officers—D. B. Blossom, president anad treasurer; George W. Cruikshank, vice-president, and Arthur B. Lee, secretary.

Fond du Lac, Wis.—The Cleaver Motor & Vehicle Co., with $20,000 capital, to manufacture automobiles. The officers are F. C. Cleaver, president; T. H. O'Brien, vice-president; G. W. Watson, secretary; G. A. Knapp, treasurer, and J. A. Chapman, of Milwaukee, superintendent.

Chicago, Ill.—The Merchants' Auto Transfer Co., with $1,000,000 capital; to transfer freight in Chicago from one depot to another. The officers are: President, Josiah Cratty; vice-president, Charles L. Lindquist; secretary, W. S. Williams, and treasurer, Parker H. Sercomb.

Stole a Tonneau Car.

Quick work was made of the recovery of a stolen automobile last week. The garage of S. B. Bowman, at No. 52 West Forty-third street, this city, was broken into and a Thomas tonneau car spirited away. This was discovered at 8 o'clock on Friday morning. The police were notified, and in the afternoon word was received by Captain Lantry that a machine answering the description of the stolen one had been found in Yonkers. P. A. Hagel, manager of the garage, went there with Mr. Bowman and identified the machine. Henry Fitzgerald and three other young men had been arrested and held. They had been attracting attention by racing through the streets and had been enjoying themselves on the proceeds of the sale of the lamps from the auto, which a livery stable keeper is said to have purchased from them for $10. As the New York police did not have any warrant, the prisoners were left at Yonkers.

Motor Cars Instead of Trolleys.

A most ambitious plan is said to be under consideration by a number of Cincinnati, Ohio, business men. It is to secure about five hundred auto cars and establish regular routes from the heart of the city to the suburbs. A fare of five cents a passenger would be charged for the haul, and the promoters say that with double-decked 'buses the service will be equal to that of a street car line. Such 'buses, they also claim, could be operated at a minimum cost, and they would greatly relieve the congestion in public transportation.

An automobile stage line has been projected to run between Babylon, Bayshore, Islip, Sayville and Patchogue on the south shore of Long Island, a distance of about twenty miles. It is said that a proposed trolley line will be abandoned in consequence.

BAY STATE "ANTIS" HEARD

But They Trot out But one New Argument—Motorists Make Strong Retort.

One distinctly new argument in favor of automobile speed restriction was brought forth in Boston on Monday, when the Massachusetts legislative committee on roads and bridges gave a hearing on the automobile bills now before it. That eminent Bostonian, Moorefield Story, denied the expediency of permitting a greater speed in the country than in the city. "In the city," he said, "there are sidewalks to which we can escape." In the country apparently there is no way of escaping from the automobile juggernaut.

Eight bills have been presented, but at the hearing only one of them was discussed. It was introduced by Roland W. Boyden as a substitute for a bill of Henry L. Higginson and others. It provides that all automobiles shall be registered and nnmbered upon each side and back with Roman letters at least four inches long; that all operators shall be licensed, and that machines shall be provided with lamps, brakes, etc., and that the penalty for infraction of these regulations, or of the law relating to speed, shall be a fine or imprisonment, or both, or the revocation of the operator's license for a year.

In addition to a number of laymen, an imposing array of legal talent was present to argue for and against the bill, and trained its oral artillery on the listening legislators. One side protested against any increase in the present maximum speed of fifteen miles an hour uniform throughout the State; and it was even urged that each town be given the privilege of determining this speed. The other side urged an increase to twenty miles, and protested against legislation inimical to the automobile and certain to check its progress.

F. E. Stanley, of Newton, spoke against the Boyden bill and hit straight from the shoulder. He said the rate of ten miles an hour for a horse is fixed not from the standpoint of safety, but on the capacity of the horse. It is just as safe to drive an automobile twenty miles an hour as to drive a horse ten miles an hour.

"Horses," he said, "are becoming accustomed to the automobile. You are legislating for the future, and as an automobile manufacturer I want to know what the future of the industry is to be. Don't impose restrictions and expensive requirements, because if you do you are striking at an industry that is going to be important.

"I want to see the time when every laboring man, earning $2.50 or $3 a day, can own an automobile. That would mean clean streets, for 99 per cent of the filth on our streets comes from the horse. The street commissioner of New York owns an automobile, and frequently exceeds 20 miles an hour. I don't object to the rate being placed at twenty miles, for as soon as the horse disappears there will be so many automobiles it will not be safe to go any faster than that."

Fred Tudor, representing the New England Automobile Association, said the present law was satisfactory to that association, except the speed limit of fifteen miles, which was too low. The association sent out circulars to be signed, saying the speed limit ought to be raised to twenty miles in the country and twelve miles in the city, or over. They received 1,421 affirmative replies. They also sent out circulars to 2,500 physicians, and 334 sent favorable replies and sixteen that were not altogether in accord. An automobile, he contended, is far more controllable than a nervous horse.

"The horse," he continued, "is absolutely going out of use as a necessary means of locomotion, and those familiar with the matter say that in New York in ten years a horse will not be allowed upon the streets unless by payment of a tax. The cost of maintenance of the streets anad highways is largely increased by the use of horses."

Mr. Tudor believed there ought to be a State law fixing speed. He would not leave it entirely to local option.

"These are not the vehicles of the rich man alone," said C. F. Choate, jr., for the New England Association. "Twenty-five per cent of the automobiles in use in Massachusetts are used by doctors, because they have been found more efficient than the horse.

Old Arguments Against Railroads.

Among the many absurd bills introduced at Madison this session is one to not only license automobiles, but to compel every user thereof to stop at the bidding of every farmer or user of a carriage driven by horses, attaching a penalty to the non-compliance of such a request. This reminds one of the difficulties encountered by the celebrated George Stephenson, the father of railways, in getting a charter for the first line ever constructed, observes the Eau Claire (Wis.) Leader.

The members threw every possible obstacle in his way and propounded all sorts of ridiculous questions. The locomotives would drive horses insane. Cattle in the fields through which the rail went would be so scared that instead of fattening they would actually lose flesh. Hundreds of post boys, coachmen and hostlers would be thrown out of employment, and similar absurdities. The bill came very near being defeated, which would have put back the clock of the world one hundred years. It is to be hoped that a State so progressive as Wisconsin will not stultify itself by taking a retrogade step and passing this bill. The same objections that are now being urged against the automobile were, it will be remembered, urged against the electric street railways in every city in the State. If the world is really turning round, all mankind together will not be able to keep it from turning, or to keep themselves from turning with it.

AMENDING NEW YORK LAW

Long Island "Protectors" get Their Bill Introduced—Full of "Protective" Provisions.

Another Doughty automobile bill was introduced in the Assembly of this State last week, together with a similar measure by Senator Bailey in the Senate. It is received with mixed feelings by autoists. An improvement on the vicious Cocks law it certainly is, as far as speed regulations are concerned, but it is far from being an equitable or even a reasonable measure. Furthermore, it is saddled with a licensing system, and on that account also objectionable.

Townsend S. Scudder, counsel for the association formed by residents of Long Island to regulate the speed of automobiles, prepared the bill. It provides that trustees of incorporated villages and the highway commissioners of towns may adopt ordinances not inconsistent with the limitations prescribed in the bill, regulating the speed of automobiles. When local ordinances are adopted signposts must be erected beside roads with the inscription, "Slow down to —— miles," in accordance with the local regulations.

In general, the bill provides that no automobile shall pass a team or a pedestrian at a greater rate of speed than eight miles an hour. In passing schoolhouses, between 8 o'clock in the morning and 4 o'clock in the afternoon, or churches on Sunday, the speed must not be greater than ten miles an hour. In crossing bridges or causeways, where the roadway is less than twenty feet wide, the speed limit is four miles an hour, and within one mile of a postoffice it is eight miles an hour.

Owners, within thirty days, are required to register their names, the name of the maker of each automobile and its number with the Secretary of State and obtain a certificate from him. Automobiles must have the initials of their owners and the number of the license in black letters on a white ground. The letters and figures must be three and one-half inches high. When stopped on signal, the automobile must not only remain stationary, but must be kept as noiseless as possible.

Drivers of all automobiles capable of developing more than 10 horsepower must have licenses from the State. The State Engineer is authorized to appoint a chauffeur examiner to examine chauffeurs, issue licenses at $5 each, and to revoke them for cause. Holders of licenses must show them to any peace officer.

Penalties for violation of the act are as follows: For the first offence, suspension for from two weeks to one month; for the second offence, suspension for from one month to six months; for the third offence, revocation of the license, and for the fourth offence, disqualification from holding licenses. These penalties are in addition to the criminal penalties, which may be imposed as follows: For the first offence, a fine of $5; for the second offence, a fine of $100 or thirty days' imprisonment, or both, and for the third and subsequent offences, a fine of from $100 to $250 or imprisonment for thirty days, or both. Violations are made a misdemeanor.

TO LESSEN SIDESLIP

Tests of an English Device Prove it to Possess Virtue—What it is Like.

More extended experience with the counter-skid, an English device, is said to have demonstrated its efficacy. It is not a preventive, of course. But in the hands of an alert and skilful chauffeur it should go a long way in the direction of checking or minimizing the "sickening side slip" that autoists even on this side of the water have cause to know all too well.

The device is attached to the rear axle of the car, and consists of a pair of hinged brackets which are capable of being raised or lowered at will. Running free on a pin to the end of each of these brackets is a wheel of peculiar construction. Made of steel, this wheel or disk is shaped somewhat like a saucer, with a sharp rim, and when the counter-skid is working these disks are in contact with the road, revolving in consequence. They are located on the inner part of each bracket with the edge actually in contact with the road surface. Supposing, therefore, the driver sees a patch of mud ahead of him or a doubtful corner he drops the attachment from its idle positions, and lets it run.

Now, if the car attempts to slide to the right, the edge of the left hand disk catches instantaneously in the surface of the road and prevents any further movement in that direction. Similarly if the car attempts to skate to the left, the right hand disk grips the surface and instantly checks the sliding motion.

The method of lowering the counter-skid is exceedingly ingenious. On the right hand side of the driver's seat there is a small vertical lever fitted, which when the necessity of lowering the apparatus arises can be instantly released by the merest touch of the driver's elbow, and without requiring to remove his hand from the steering at a critical period.

The raising to the idle position is accomplished, since it is not an operation requiring haste, by a small hand wheel fixed to the side of the car body behind the brake handle and within easy reach of the driver's hand. This wheel has a small drum concentric with it which winds up the flexible wires which raise or lower the brackets. It has a ratchet also attached to it, in which the lever from the seat catches, and naturally, when the ratchet is freed, the brackets with their disks drop almost instantaneously, so that, provided even a side-slip has started it may be instantly stopped by releasing the counter-skid at once.

The greatest difficulty that was encountered in designing the present form of attachment was the question of automatic adjustment to the various conditions under which the car was running, namely, the varying height of the axle from the ground, owing to road vibration, the degree of inflation of tires, etc. This has been overcome by the hinging of the brackets, so that the disk is always on the road in an inclined position. The movement of the hinges is limited by stops of large area, so that should a slip occur so violent as to raise the car on the bracket it would be impossible for it to go further without actually breaking the support. Were this stop not fitted, should such a contingency occur, the last state of the car would be worse than the first, since, not only would the disk be ineffective, but there would be the extra momentum in a transverse direction of the drop from the height of the bracket.

The whole of the mechanism necessary to the working weighs about twenty-five pounds, which is exceedingly moderate considering the immense strength required and embodied in its construction. The price is put at $100, or less, depending entirely on the relative difficulty of fitting to the different makes of cars.

Experiments With Mechanical Valves.

As the result of some experiments carried out in connection with the new Germain carburetter, some interesting figures bearing directly on the vexed question of mechanical and automatic valves are attainable. The experiments were carried out with a four-cylinder engine of approximately 15 horsepower, so arranged that either automatic or mechanical valves could be fitted without altering any other conditions.

The results showed that the engine could be run at a slower pace with the mechanically operated valves, and that when they were fitted more power was exerted stroke for stroke of the engine, though this increment was very small. The natural conclusion is that though the adoption of the mechanically operated valves gives an increase in flexibility to the motor, yet it is doubtful whether the extra complication and friction introduced by the necessary operating mechanism are compensated for by the advantage obtained, leaving out of consideration the question of cost.

Whether these results apply to engines not fitted with automatic carburetters, it is difficult to say without further experiment, but it is questionable whether the most efficient method finally is not to adopt the carburetter regulating the mixture by admission of extra air.

The Week's Exports.

Havre—1 case motorvehicles, $1,890.

Lisbon—1 case motorvehicles, $1,024.

Liverpool—2 cases motorvehicles, $2,800.

Cuba—1 case motorvehicle material, $30.

Newfoundland—1 case motorvehicles, $825.

London—27 cases motorvehicles and material, $22,210.

Argentine Republic—5 cases motorvehicles and material, $1,150.

FRENCH FUEL TESTS

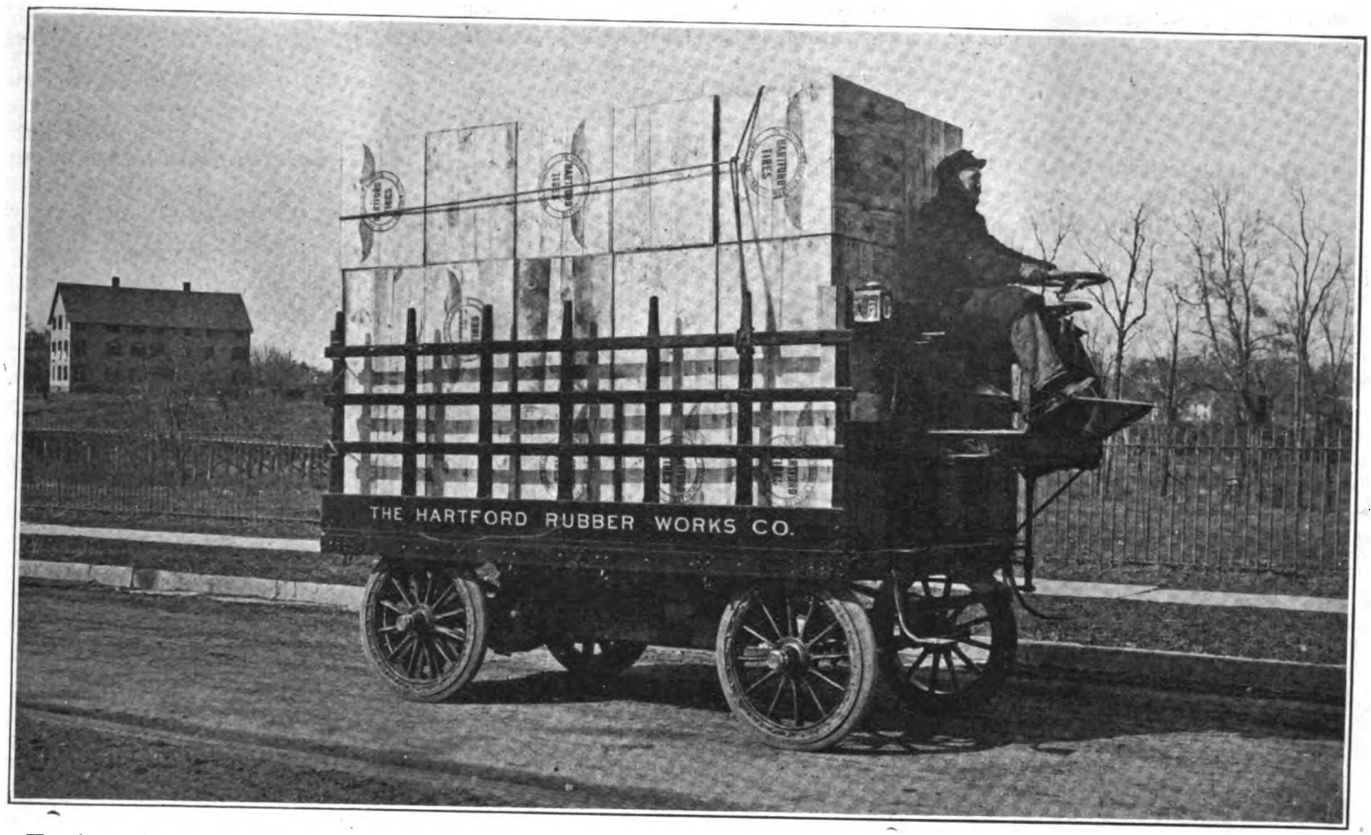
Annual Event Proves Cars Have Advanced in Economy—Three Medals for Peugeot.

For the third successive year the consumption trials organized by L'Auto were held during the last week of February. The usual course was adhered to—that from Suresnes to Corbeil and back, a distance of 100 kilometres (62.1 miles).

The results made it clear that still further progress has been made in the direction of economy in fuel consumption during the past year. Four of the light cars covered the course with a consumption of less than six litres of gasolene—the litre being just over one quart (0.9463 litre equals one quart). Two of these cars—the new six horsepower "Popular" De Dion—consumed exactly 4.4 litres each. It will thus be seen that this figures out at just under two gallons for one hundred miles, as against three gallons in round numbers recorded in the various tests held in this country.

Taking the cars according to their weights, a Peugeot carried off the honors in the next, the "light carriage" class, with a consumption of 5.2 litres for a 6½ horsepower car. Among the big cars, the Chenard-Walcker repeated its triumph of last year, its 10 horsepower car consuming 6.29 litres.

A good showing was made by the industrial cars. A 6 horsepower Gillet-Forest "lorry," carrying a load weighing 910 kilogs, covered a course of 37.2 miles with a consumption of 8.7 litres. Among the cars carrying more than a ton, a 5 horsepower Bardon excelled. It had a load of 1,540 kilogs, with a consumption of 6.96 litres.



On a classification per kilometre ton the big lorries scored heavily, a 12 horse-power Peugeot getting down to the lowest figure yet officially recorded, of .0489 litre. A 5 horse-power Bardon wagon, however, ran it very close with .0496 litre. Peugeot was also victorious in the light carriage class with .0536 litre, and then came Chenard et Walcker, .5042; 8 horse-power Bardon car, weighing more than a ton, .0592; Chenard et Walcker, .0614; Peugeot light carriage, .0635 litre of alcohol.

All these figures would have been regarded a year ago as something remarkable; but so many cars have got down below what was formerly supposed to be the limit of economy that there is plenty of hope of still better performances being accomplished in the future. It will be remarked, too, that these low consumptions have followed upon the adoption of comparatively slow-running motors, which may possibly have something to do with the results; and there is no doubt that the transmissions are also responsible in a large measure for this greater economy.

A large number of medals and prizes were offered, and among these latter Peugeot secured the lion's share by carrying off the prize for the three vehicles giving the lowest total consumption, a prize for the lorry, another for the light carriage and the gold medal offered by the Minister of Agriculture for the most economical vehicle running with alcohol, as well as a gold medal for the carburetter.

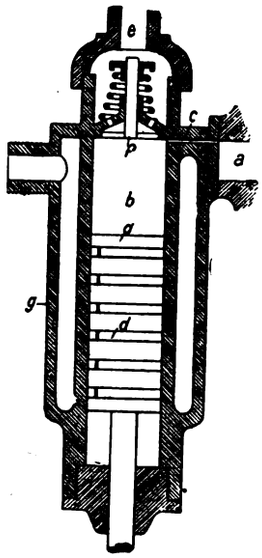
Electric Truck Proves Its Economy in Hauling Tires.

The Hartford Rubber Works Company not only make tires for automobiles but they use an automobile in transporting the same tires to the railway freight depot in Hartford, as the accompanying illustration makes evident. The truck is used daily in delivering goods at a station two miles distant from the factory and makes four round trips, or sixteen miles, one trip better than was possible with the three-horse team previously employed. The Hartford people estimate the saving to be roughly $20 per week. The truck is the product of the Electric Vehicle Company and is equipped with two General Electric 85v and 20a motors using 42 exide cells. It has four speeds, two foot brakes, wheel steer, vertical controller, full Collinge axles, 36 in. wheels and Turner solid rubber tires.



Why Some Tires Become Hot.

There is one point in connection with tires which is not generally understood, and that is the cause of the extreme heat generated. This is mainly due to the friction set up in the material itself. With proper tangential fabric the pull is taken direct from the rim, and consequently the friction from this cause is not considerable. A different state of affairs, however, exists in the layer of rubber lying between the fabric and the road surface. The drive is of course communicated to this layer of rubber. There is no fabric, either tangential or otherwise, to take up the strain, and consequently there is very considerable movement in the rubber itself. This generates heat. The whole question of tire making is hedged round with difficulties of this nature, many of which are not thoroughly understood.

Plans have been drawn for one hundred and fifty houses to be erected at Trainer, Pa., where the works of the Searchmont Automobile Co. are located. They are intended to accommodate workmen who have, owing to the scarcity of houses at Trainer, been unable to find suitable domiciles.

De Dion's Self-Igniting Device.

French patents have been taken out by the De Dion-Bouton Co. on the self-igniting device referred to in these columns a few weeks ago. The principle of the device is the ignition of the charge in explosion motors by means of the heat of compression in a special small cylinder which produces a flame.

The small cylinder (b) is fastened to the side of the main cylinder, and is in communication with the compression space (a) of the latter by a small passage (c). In the small cylinder works a tight fitting piston, which is forced upward in it, once for every two revolutions of the motor crank shaft. An explosive mixture is admitted to the cylinder at the upper end thereof through an automatic suction valve (f). When the piston in the small cylinder is forced upward the gaseous charge therein is compressed to the point of self-ignition, and the flame travels through the small passage to the compression chamber in the main cylinder and explodes the charge therein.

In order to vary the time of ignition the mechanism by which the piston in the small cylinder is operated must be arranged to effect this operation at a variable period.

It is understood that the makers of the Mercedes, the Daimler Co., will make a determined effort this year to win the Bennett Cup. The team has not been yet selected, but it is thought probable that Count Zborowski, Baron de Forest and M. Degrais will be selected, all three having lately joined the German Automobile Club.

Labor Leaders' Great Scheme.

To form a stock company to purchase and operate automobiles for the transportation of passengers during street railway strikes is a plan said to be entertained by labor organizations. At a conference between Samuel Gompers, president of the American Federation of Labor; President Mahon of the Street Railway Employes of America, and Chairman Dillsworth of the National Board of the Street Railway Organizations, the plan was discussed. If it were carried out thirty automobiles would be sent to Waterbury, Conn., to be operated by strikers for passenger service.

Road Books as an ad.

In a handy pocket form Heineman & Pratt have issued an automobile road guide to Southern California. Starting from their store in Los Angeles, the best routes to nearby places are indicated on outline maps. Incidentally views of the concern's salesroom are given, together with a description of the work done in the garage and repair shop.

Stevens Will not Move.

The report that the automobile department of the J. Stevens Arms & Tool Co., Chicopee Falls, Mass., would be removed to the factory formely occupied by the Overman Wheel Co. is denied. The company's search for better quarters for the body department caused the rumor to originate. It has now been decided to make no change.

The "Colony" at the Noon Hour.

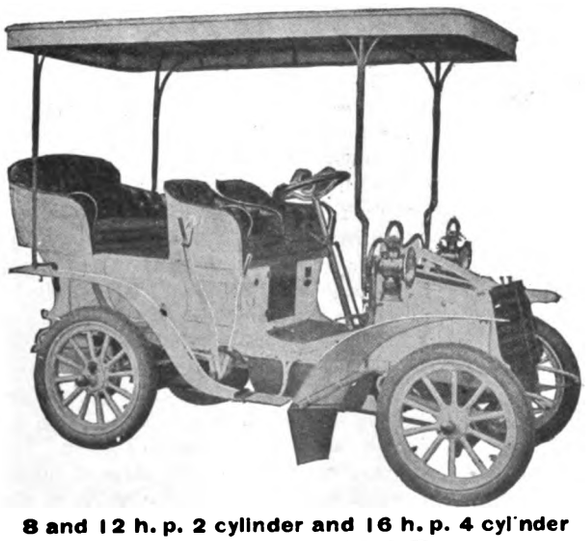
Biggest of the half dozen or so automobile "colonies" in this city is the one in the neighborhood of Broadway and Thirty-eighth street. Luncheon time there presents an animated and unusual appearance. The chauffeurs and mechaniciens pour out by the score, and, after staying the inner man with a hasty "bite," give themselves up to the luxury of a smoke and a little chat. Arrayed in garb of all sorts—from the conventional leather cap, coat and leggins, to ordinary citizens' clothes—they present a picturesque appearance.

They break up into little groups and discuss the burning questions of the day. Their joys and sorrows form the bulk of their talk. The perverseness of motors, the peculiarities of owners, the difficulty of keeping within the legal speed limit and getting anywhere, the narrow escapes from too zealous cops—these are just a few of the topics that are touched upon. And then, their period of play at an end, they disappear almost as quickly as they came in view, and but for the occasional passage of a car on a demonstrating trip the street would seem almost deserted. The scene of activity has been transferred to the salesrooms and garages.

A new storage, repair and sales station has been opened at 62 West Forty-third street, New York, by the American Touring Car Co. The company is agent for Jones-Corbin cars.

Surprised by the Kensington.

The new Kensington touring cars are reported to be revealing unexpected excellencies. According to Homan & Schulz, who sell them in New York city, the running qualities of the car have surprised them. It is a vehicle to which not a great deal of attention has been attracted, and being little known and advertised, not much was expected of it even by its agents. They say they have been agreeably surprised though, for it runs without a bit of trouble every time one goes out, and when it comes to climbing it fairly "eats the hills."



Room for 50 Cars in Jersey City.

The new store and garage of the Crescent Automobile Co., Boulevard, near Duncan avenue, Jersey City, N. J., is almost completed, and the removal from the old place at Crescent and Communipaw avenues will take place this month. Storage room for fifty cars has been provided, and the place has been fitted up in the most approved and up to date manner.

Denver's Peculiar Demands.

"The high altitude of Denver, Col., plays havoc with all except cars of very high power," says W. A. Richwine, of the Autocar Co. "It necessitates a reduction of the compression chamber, and in the case of automatically operated intake valves a lightening of the springs of these valves.

HOW THEY ORIGINATED

Various Types of Vehicles That Took Their Designations From Prominent Persons.

For such an ancient trade the most popular type of horse drawn carriages are of very modern origin. The phaeton is almost two hundred years old, and the barouche is of considerable greater age. But the brougham, the victoria, the stanhope, the surrey, etc., all date from the last century, and, curiously, were all named after notable personages for whom they were designed.

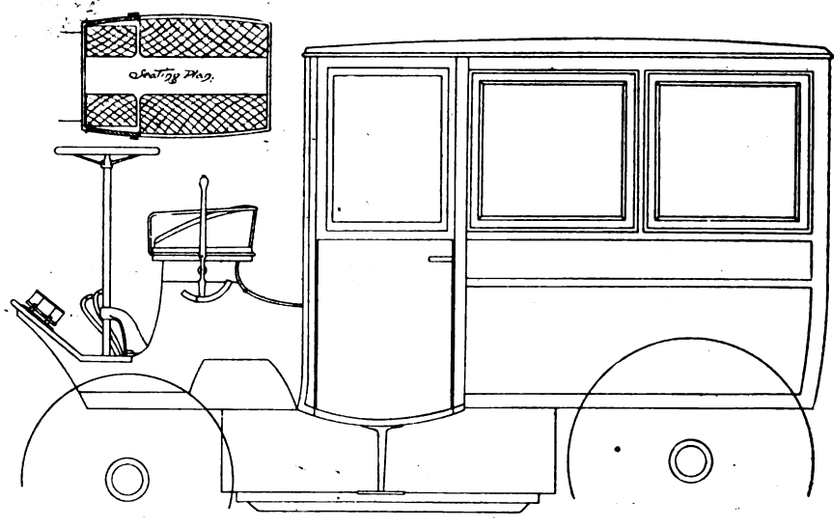
The brougham is a closed carriage, with driver's seat in front of the body and well elevated. The French call it a coupé, from coup, meaning cut. Its origin is due to Lord Brougham, who, in his younger days, was a judge, and in travelling in his circuit in the old style vehicle experienced more or less discomfort. The idea occurred to him one day that a smaller vehicle, suited for two persons, would be much better than the more cumbrous vehicles then in general use. He made known his notion in the matter to a prominent carriage builder, and explained what he wanted and asked him if he could build such a vehicle. The builder went to work, and produced the brougham substantially as it is to-day. Lord Brougham was born in Edinburgh, Scotland, September 19, 1778, and died at Cannes, France, of old age, in 1868.

The stanhope, as originally built, had a comfortable front seat for two, coachman and footman in the rear. It was constructed with and without top. The gentleman always drives. The French call it a phaeton, and the English call it a stanhope or stanhope phaeton. The original was made without a top, used for sporting purposes, and was designed for the Hon. Fitz Roy Stanhope.

The phaeton at present is made in many styles. The French and English builders apply this term to several distinctive styles, but it is not used there as much as in America. The first phaeton was made in the year 1704, and was named for "Phaeton," called the shining one in Homer. The term is known in mythology, and indicates a son of the sun, and sometimes the ocean nymph Clymene.

The victoria was first made in England in 1850, anad was named after Queen Victoria. It is a lady's park carriage, having a low seat in the rear, intended for two persons, covered with a half top or cabriolet top, and has an elevated seat for the driver in front.

The surrey originated in England about 1840. The name was taken up in this country and first applied by J. B. Brewster & Co. to a very light wagon for two, but later was built for four



The hansom was designed and built by Joseph Hansom, Leicestershire, England, in 1834, and is a two wheeled vehicle, with doors or lid in front and a driver's seat above and behind.

The barouche is similar to the caleche, and, like the brougham, has a driver's seat. It has two seats, carrying four passengers back of the driver, with a three or four bow top over the rear seat. In the United States barouches have been made with an extension top. It derived its name from a French architect named Barochio, and who made the original barouche about the year 1560. Barochio was born in 1507 and died in 1573.

The wagonette is a four wheeled vehicle, carrying six or more passengers. It was built for Lord Curzon in 1843, and was designed by Coach Builder Lovell, near London, England.

Miss Griggsby's Side-Door 'Bus.

To so manœuvre an opera 'bus that the rear end is backed up against the curb, ready for the ingress of its consignment of fashionably dressed people, is no easy task.

It is especially difficult on a congested street like Broadway, with its two lines of trolley tracks and its hurrying throngs of pedestrians and wheeled vehicles of every description. There is scant time at the chauffeur's command. He must handle his 'bus with consummate skill, or his passengers will be compelled to ignominously go into the street and enter from that point of disadvantage.

To obviate all this a New York society woman, Miss Griggsby, is having the Electric Vehicle Co. build her a special 'bus, with the door on the side. With this arrangement—shown clearly in the appended drawing—egress and ingress will be easy, precisely like that afforded by a brougham or other well appointed vehicle. In other respects the 'bus is a duplicate of the company's standard pattern.

So well pleased is Miss Griggsby with the working of electric vehicles that she is contemplating disposing of her horses and horse-drawn vehicles and replacing them with self-propelled ones. She has had an electric landau in service for two years, and her proposed action is largely attributable to the satisfaction it has given.

HOW TIRES GAIN WEIGHT

Why the Weighing Test Designed to Prove Wear Really Proves Nothing.

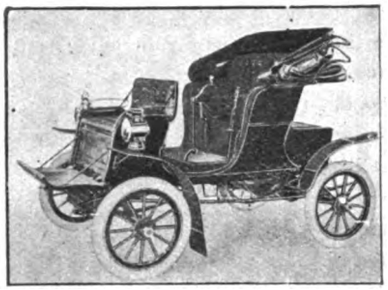
It is said that the uselessness of weighing tests for tires, designed to show the wear through attrition, was pointed out in a convincing fashion to the judges in the tire tests of the British Automobile Club last year.

One of the competitors pointed out the uselessness of this test under the conditions laid down, and succeeded in inducing the judges to weigh a new set of tires, which had been in their possession from the date of the commencement of the trials. It was found that they had actually increased in weight from two pounds upward, and if the weighing test had been proceeded with, it would possibly have been found that some of the tires in use had also increased in weight.

The explanation is really simple. Both rubber and fabric are dried most carefully in the factory for several weeks, so that every trace of moisture is removed. Now, both are to a certain extent porous, and when left in an ordinary humid atmosphere, absorb a considerable amount of moisture, which of course increases the weight.

Daimler's New Braking Device.

The Daimler Company are said to be adopting a new braking arrangement for the countershaft on their latest cars, and are using metal for both friction surfaces. The device consists of a pair of band brakes on either end of the countershaft, the drums being fixed directly inside the chain sprockets. The bands are steel lined, and the apparatus is worked from the foot pedal. The movement of the pedal causes the brakes on the wheel drums to act simultaneously with those on the countershaft with a consequent distribution of the strain.



The advantage claimed is that a great strain is taken from the differential and that less pressure is required for reducing the momentum.

TESTED THE HYDROLEUM

And the Burner for Steam Vehicles Developed an Array of Favorable Figures.

Some interesting experiments have been conducted with the Hydroleum fuel system, about which so much has been heard lately. They were in charge of W. Worby Beaumont, the eminent English motor vehicle authority, who used a Locomobile for the purpose.

In one case gasolene was burned with the Locomobile burner, and in the other crude Texas oil with the Hydroleum burner. The trials consisted of two runs of fifty and fifty-two miles over practically the same road one days when the roads were in an approximately similar condition of surface anad through similar traffic.

The main purpose of the trials was to ascertain the relative evaporation power of the same boiler with the two very different kinds of fuel. The run with the gasolene burner in use was made without any noteworthy incident, the burner behaving uniformly well. On the trials with the Hydroleum burner the driver was skilled in its use, but not sufficiently so on the road to avoid occasional excess in water level and consequent wetness of steam passed to the boiler. In the evaporation tests with the car standing, similar conditions as to feed water temperature, and feeding were observed. The records were begun after evaporative conditions had become normal, a two hours' test being sufficient for so very small a boiler.

With the gasolene the evaporation per pound of fuel was much greater when the car was running and the boiler in a constant state of small oscillation and vibration than when the car was standing still. When referred to the usual standard of evaporation—namely, from and at 212 degrees—the evaporation on the road trial was 15.8 pounds of water per pound of petroleum spirit, while with the car standing the evaporation was 11.5 pounds per pound of fuel. The figures referring to the Hydroleum burner trials show that the equivalent evaporation with the car on the road was rather more than with the petroleum spirit with the car standing, but was rather less than with the Hydroleum burner with the car standing, the equivalent evaporation per pound of oil being 11.88 and 11.92 pounds from and at 212 degrees, which must be considered a highly satisfactory quantitative result with so small a boiler. If the Hydroleum burner had not been extinguished four times during the run a higher rate of evaporation per pound of oil would no doubt have been obtained when running.

The water evaporated per gallon of fuel was higher with the oil than with the petroleum spirit, and the quantity of water evaporated per hour and per mile covered was greater with the oil than with the petroleum spirit, again pointing to wetness of steam during the oil run. The rate of evaporation per hour with the petroleum spirit burner was much lower when the highest duty per pound of fuel was obtained than with the higher rates of evaporation per hour. When the boiler evaporated as much per hour during the petroleum spirit trial as in the oil trial on the road, the consumption of fuel was greater than with the oil. From this it will be seen that with the smaller rate of evaporation per hour dryer steam is obtained with greater economy and used with greater economy.

The cost of fuel for the two journeys was 87 cents with the standard gasolene burner and only 16 cents when the Hydroleum system was employed—a considerable economy being thus effected.

To Aid Chain Lubrication.

Numerous efforts have been made to devise some way of insuring thorough lubrication of chains. One method is to introduce an oil siturated felt pad in the chain links. Another even more effective is being tried by the makers of the Brampton chain, al-

though so far it has been confined to the larger and more expensive sizes.

As will be seen from the accompanying drawing, this is effected in a very simple manner. Each rivet is drilled with a hole at its centre, into which another hole is led from the outside of the rivet as shown. The central hole is counterbored to admit of the insertion of a light spring and a one-quarter inch steel ball, the latter being retained by spinning over the edge of the counterbore.

Advancing the Electric Car.

Entirely aside from its electric motoirs, controllers, cutouts, etc., the great Westinghouse Company is giving attention to the installation of station and private charging outfits.

The station switchboards are intended for use where several vehicles are charged simultaneously. They are so arranged that the voltage and current of any vehicle being charged may be controlled and measured at the board. This makes it possible to make all measurements with only one set of instruments and to keep an accurate record of the condition of each battery. The rheostats used in connections with these parts are either of the grid or imbedded type and are well ventilated and of substantial and non-inflammable construction.

The private switchboards are supplied with volt-meter, ammeter, switches and an automatic circuit breaker, which prevents the over-charging of the battery. These switchboards may be mounted on a wall and occupy very little space.

CEMENT IS NECESSARY

Why the Man who Would Secure Tires With Lugs Only Courts Trouble.

"It may not be strictly parliamentary, but I want to say that the man who advocated securing tires to rims merely by the lugs is an egregious idiot," remarked a tire man to The Motor World representative. "He just simply doesn't know what he is talking about. I don't care how practical a man he is, nor how many tires he has put on. At best he is one of those self-opinionated workmen who think they know better than men who have been making tires all their lives.

"When you come right down to it you must admit that the experience gained in making, selling and riding bicycle tires counts for a great deal. Well, what does that experience teach us? Why, that one of the things you have got to do, if you want your tires to stay on, is to fasten them right. In the days of steel rims we used a hard cement, and it did fairly well. When the wood rim came in we had to try something else, on account of the difficulty of heating the cement without hurting the rim. Consequently, there was lots of trouble with creeping tires.

"It began to be observed that Columbia wheels were free from this fault. Some one of an investigating turn of mind looked into the matter and found that instead of cement they used shellac to fasten the tires. That did the business. I have known men to tear part of the rubber coating of the tire off in pulling it away from the rim, so tightly did it stick. That was unnecessary, of course, for a little gasolene would loosen the tire sufficiently to get it off without trouble. And after that this particular dealer began to use shellac also, and with splendid results.

"Now if a bicycle tire is hard to keep on the rim, what must it be with an automobile tire? Every influence at work to cause creeping in the first case is present and working overtime in the second. That is why the tire makers began to put lugs on. With them the chance of creeping is much diminished. But you can't depend entirely on lugs. You must have the tire grip the rim all the way around, and just as tightly as possible.

"That is where the cement, or, much better, shellac, comes in. It will make the tire grip. So will good cement; but it should be good. With a rim that fits the tire properly, and a tire that is shellacked or cemented, with lugs as well, you have some chance of avoiding accidents. But to omit any of these is, as I said, idiotic.

"The next time you see that smart Aleck who doesn't want anything but lugs to hold tires, you present my compliments to him and tell him what I say. It is dollars to doughnuts that he has lots of tire troubles, but hasn't sense enough to discover that it is his foolishness in dispensing with cement and shellac that is causing it all."

Features of Billings's Mors.

What was undoubtedly the first of the 1903 crop of Mors cars imported by private owners made its appearance at Smith & Mabley's on Saturday. The car was the direct importation of C. G. K. Billings, the well known horseman, and was released from the Custom House only the day before.

It is an imposing looking car. It is rated at 45 horsepower, and contains the new features that are directly traceable to the influence of the Mercedes on French construction. The intake and exhaust valves are arranged on opposite sides of the cylinders, both being operated mechanically by means of half time shafts driven from the engine shaft by fibre gear wheels. A honeycomb radiator of the lozenge type, aided by a flywheel and a pressed steel U frame, are other conspicuous features.

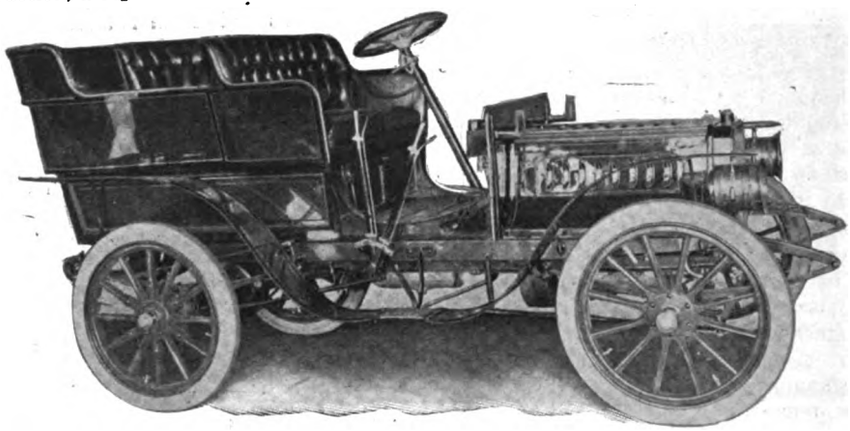
The body is of the limousine pattern, roomy and exceedingly comfortable. Access to the rear portion of the body is afforded through the front, the left hand forward seat lifting up and leaving an opening. There is room for four passengers in the rear, the seats being parallel, transverse instead of longitudinal, and facing each other. The appointments are most complete and luxurious. There is a speaking tube, by means of which the chauffeur can be communicated with, and two electric lights. The interior is furnished in fawn colored cloth, and the body is finished in a rich cream color, with dark trimmings.

How he "Dodged" Storage Charges.

"Just heard of a sale that made my mouth water," remarked a well known Brooklyn autoist to the Motor World man last week. "And that although I have two cars and have no earthly use for another.

"It was that of a friend of mine who is going abroad. He intends to bring a foreign car back with him, and this being so he was naturally anxious to dispose of his own—a little runabout of well known make. It was not a particularly good time to sell automobiles, and as my friend wished to get rid of his before he sailed he was ready to let it go cheaply.

"The best offer he could get was one of $200—an absurd figure, as the vehicle was in fine condition. For a moment he was tempted to refuse it, but reflecting that the money would pay his passage both ways, and he would not have to pay storage while away, he accepted it.



"I hope the purchaser appreciates his bargain, for it is a bargain if ever there was one."

Mechanical Inlets an Uphill Aid.

It is not only on large cars that the mechanically operated intake valve proves good practice. The fact that so many of the small American cars have used this method of opening both intake and exhaust, and with such excellent results, makes this plain. One thing that has not been much noticed is the beneficial effects resulting from its use uphill. With the single cylinder engine straining, and the piston speed fallen down to one-half, the automatic valve which works perfectly on the level is either not admitting a full charge or is not holding it—according to the inlet spring tension. Several devices to obviate this acknowledged defect have been tried, but it is extremely doubtful if they are, on the whole, as good as the mechanical inlet. Of course, this will wear, but do not inlet springs lose their tension, and is it necessary to lose the benefits of an advance because it brings in some increase of necessary supervision?

Concerning the Clement Car.

One of the most admired cars at the Madison Square Garden show was the Clement. In France the car has won a splendid reputation, both for clever designing and sound construction, a reputation that is almost certain to be enhanced by its career in this country.

THE FOUR CYLINDER CLEMENT CAR.

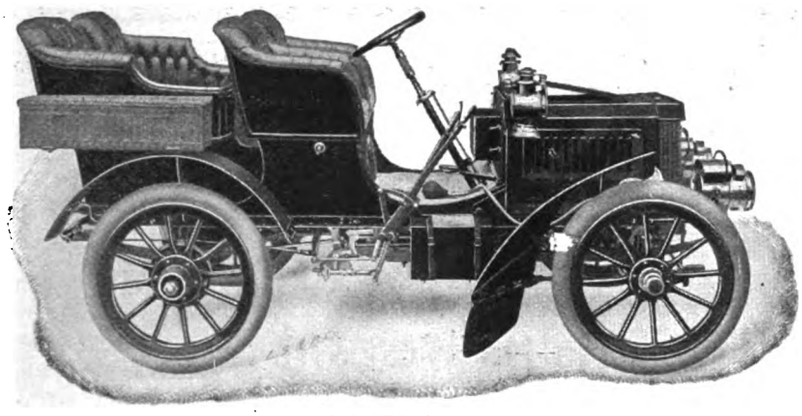
The four cylinder Clement is shown in the illustration. It is constructed with an armored wood frame, and has such up to date features as mechanically operated intake valves, honeycomb radiator, direct drive on the high speed, the expanding segment type of friction clutch, etc. The transmission is by sliding gears through a longitudinal shaft to a live rear axle. The ignition is by means of a magneto, and the water cooling is done by a centrifugal pump working direct through the engine.

Fournier is Full of Electricity.

"Both M. Rabourdin and myself came back from the United States absolutely filled with electricity, thoroughly convinced that, for city work, nothing for convenience and pleasant riding could beat the 'battery worked' conveyance," Henry Fournier is quoted as saying.

"Electric supply can be obtained for miles around New York and all other important American cities, and in time we shall have it here in France. We have therefore entered into a contract with a French company here to furnish us with motors, and, with the bodies and upholstering made by Messrs. Rothschild, we are now ready to supply the most stylish turnouts in the brougham or landaulet form."

Keep Grease off the Tires



Unusual care should be taken to prevent oil or grease getting and remaining upon the tires. All fatty substances are detrimental, as they act as a solvent upon the rubber. This can be easily proved by rubbing vaseline upon a piece of an old cover. The vaseline will cause the rubber to become spongy, and when dry it will crumble, and can be rubbed into powder by the friction of the hand. It is most important, therefore, that the rubber of pneumatic tires should at all costs be protected against grease. Messrs. Michelin et Cie state that they have had covers under their hands in which the stiffened edge had been completely rotted off by a neglected lubricator allowing oil to trickle down on the tire. Lubricators which are in positions likely to admit of this should, therefore, be frequently scrutinized. Also care should be taken that no part of the moving mechanism of the car throws oil on to the tires. For the above reason, spare tubes should always be placed in rubbered cases whenever they are likely to come in contact with oil cans, oily cloths or tools.

When Wood Wheels Require Retruing.

One place where the proverbial stitch in time saves nine is where wood wheels are concerned. Who has not seen wheels that are out of round, particularly laterally? Retruing is a thing which cannot be attempted by the ordinary repairer, and must be put into the hands of a competent carriage builder who makes his own wheels or who can get them trued up by a firm which makes a specialty of wheel building. The trouble is caused chiefly by the wheels being built up with imperfectly seasoned timber, which is greatly affected by atmospheric changes, causing fluctuations in the tension upon the wheel. This will expand in wet weather, while in dry seasons it contracts and tends to split apart at the felloe and at the junction of the spokes with that part, despite the fact that the whole is bound by the iron rim of the tire.

Work has been commenced on a building for the Tioga Automobile Company, Philadelphia. It will be 32x74 feet and one story in height.

THE HAYNES-APPERSON

is unique. It is its own type. It has proved the best for American roads, better than foreign types—better than the so-called "American type" of motor car. It is the oldest make in America—one of the oldest in the world—the most thoroughly developed.

It is interesting to note that the 1903 "Improvements" of the Paris Show have all been features of the Haynes-Apperson Car for years. Our throttle control and sparker with magneto is superior today to the best foreign practice; also our band clutch, free from end-thrust.

We have issued (in addition to our regular catalogue) an interesting booklet that tells why it is the best. Shall we put you down for one? You will greatly oblige us by naming THE MOTOR WORLD when you write. Catalogue free, too.

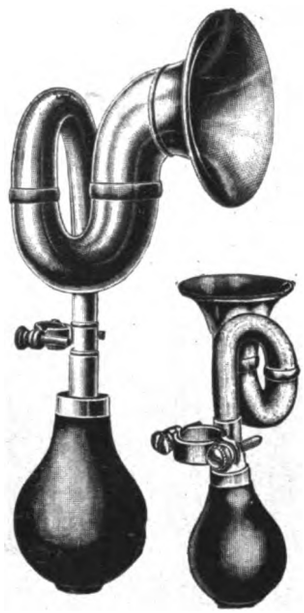
JEFFERY UNCOVERS FLAWS

Points out the Illogic and One-Sidedness of the Pending Wisconsin Law.

There are plenty of holes in the armor of legislators who prepare anti-automobile bills. A few of them are touched upon in a letter sent to the Milwaukee "Wisconsin" by Thomas B. Jeffery & Co., the well known Kenosha concern. Animadverting upon the measure now before the Wisconsin legislature, they say:

"You have doubtless noticed that a bill is now before the Wisconsin legislature to not only license automobiles, but to compel every user thereof to stop at the bidding of every farmer or user of a carriage driven by a horse, attaching a penalty to non-compliance with such a request.

"Taking the first part of the proposed bill, the licensing of automobiles, it seems to us, is a retrograde step for a State aspiring to be so progressive as Wisconsin. The licensing question has been thrashed out in practically all the Eastern States, and we believe that in only one (New York) is a license exacted for an automobile. In any event, were such an act passed for Wisconsin, the revenue derived from such a source would for some time to come be barely more, if any, than the costs of collection. Taking it in the broader sense, it is placing an unjust restriction upon people who prefer motor driven carriages to horse driven carriages, and shows a discrimination entirely opposite to the accepted rule of fair play. No argument in favor of taxation upon automobiles, on the ground of their being a luxury, can be logical, inasmuch as reliable automobiles can now be purchased for about the same price as a good horse and buggy, and their factors as sources of danger are not to be compared.



"A horse whose mind is at variance with that of his driver generally solves the question by becoming uncontrollable and running away, damaging, in a majority of cases, not only his owner, but the innocent bystander. An automobile in a like mood simply stops, and waits until its owner has attained that frame of mind that will enable him to arbitrate the point in dispute in a reasonable frame of mind and mechanical manner. Tests, public and otherwise, have been made a number of times to demonstrate the respective distance in which it is possible to stop a horse and carriage and an automobile, and such tests have proved beyond question that the automobile can stop in very little more than its own length, while the horse requires several times its own length. The possible danger, then, from this point alone is predominantly in favor of the automobile.

"Taking that part of the proposed bill which subjects the user of an automobile to the will of all horse users, this seems to us so totally ridiculous that it is hard to find even a single argument in its favor. Those who have used motor carriages will bear out our assertion that in probably 90 per cent of the cases where a horse is frightened at meeting an automobile the fright is not caused by sight of the motor carriage, but by the unreasonable actions of the driver of the horse, who seems imbued with the idea that it is a necessary part of the horse's nature to be frightened at the sight of a motor carriage, and who, immediately one comes in view, commences "sawing" on the horse's mouth and otherwise frightening him with no apparent reason for so doing, and the horse then naturally ascribes the actions to the sight of the automobile, and acts accordingly. This is a matter that can be verified at any time on our country roads."

Dannat Discovers Another "Sin."

The automobile has another sin to answer for. It has played the chief part in killing art, or, to be more precise, one of the arts, viz., painting. W. A. Dannat, president of the Society of American Painters, Paris, has made the startling discovery.

"The automobile is chiefly responsible for the withdrawal of the interest of society people from art. It is an exciting sport, and brings one into the open air. For young men it is more attractive than being imprisoned in a studio among brushes and paints. I have taken to automobiling myself, and I enjoy the sport. So it goes," he says. "The world is always changing. We give up art for sport, and lay aside the brush in order to manage the motor."

EVANS'S EARLY EFFORT

Produced a Steam Wagon 100 Years ago but was Laughed at—His Many Rebuffs.

It was during the Boston reliability contest last fall, and at the banquet at Springfield, that Winthrop E. Scarritt spoke feelingly of the earliest of American automobile inventors, Oliver Evans. Like so many others of his class, Evans was doomed to failure and defeat. He was many years ahead of his age. All that he prophesied and worked for has come to pass, but not in his day. He died, laughed at and neglected.

Evans first saw the light in 1751 at Newport, Del., three miles from Wilmington, the chief city of Delaware. He learned the wheelwright's trade, but at eighteen years of age he left his native village and went to Philadelphia, where for almost half a century he struggled to develop his many inventions. His first successful invention was a machine for carding wool and cotton, which had previously been done entirely by hand. In 1786 he applied to the legislature of Pennsylvania for a patent on his steam wagon, but it was refused as unpractical and the work of a visionary, although the same body allowed him a patent on his improvements in the making of flour. In England, where he also applied for patents, his ideas were characterized as absurd. Ten years later the legislature of Maryland granted him a patent and allowed him to use his wagon on the roads of that State. But this was of little avail, beyond the mere recognition, as he was too poor to have a wagon, and so far in advance of contemporaneous wealth that he could not raise money enough to build one and demonstrate its value.

Evans then laid his plans before the Philadelphia and Lancaster Turnpike Co., which did an immense business in transportation to the westward. He asserted that with an engine which could be constructed for $1,500, a carriage for $500 and allowing $500 for "unforeseen expenses," a total expense of $2,500, one hundred barrels of flour could be hauled, at two miles an hour, fifty miles in two days, thus doing the work of twenty-five horses and five wagons for three days, which cost $3,304. But the turnpike people could not comprehend this; they were making money enough on their teams, and so would not consider the matter.

After thirty years or more of dreaming and battle Oliver Evans saw his first horseless carriage moving on wheels by its own power. The Philadelphia Board of Health allowed him to construct a machine for cleaning the docks of the city. This was in 1804.

At the beginning of the nineteenth century Evans made the following prophecies in a letter to a New York newspaper:

"The time will come when people will travel in stages moved by steam engines at fifteen to twenty miles an hour. A carriage will leave Washington in the morning, breakfast at Baltimore, dine at Philadelphia and sup at New York the same day. Railways will be laid of wood or iron, or on smooth paths of broken stone or gravel, to travel as well by night as by day. A steam engine will draw a carriage 180 miles in twelve hours, or engines will drive boats ten or twelve miles an hour, and hundreds of boats will so run on the Mississippi and other waters, as was prophesied thirty years ago (by Fitch), but the velocity of boats can never equal that of carriages upon rails, because the resistance in water is eight hundred times more than in the air."

By one means and another Evans managed in time to secure money enough to establish a machine shop in Philadelphia, where he did various kinds of repair and other work, but busied himself chiefly in materializing his ideas in the development of machinery for saving time and labor in all branches of industry. This shop, in the later years of his life, maintained him and his family in comparative comfort; but one fatal day it was burned to the ground, involving a loss of $15,000 and destroying his patterns and his papers. This was the final blow. The fire occurred on April 11, 1819. The stricken man went to New York to secure, if possible, means to make a new start. On the Saturday following the Philadelphia newspapers contained this brief notice:

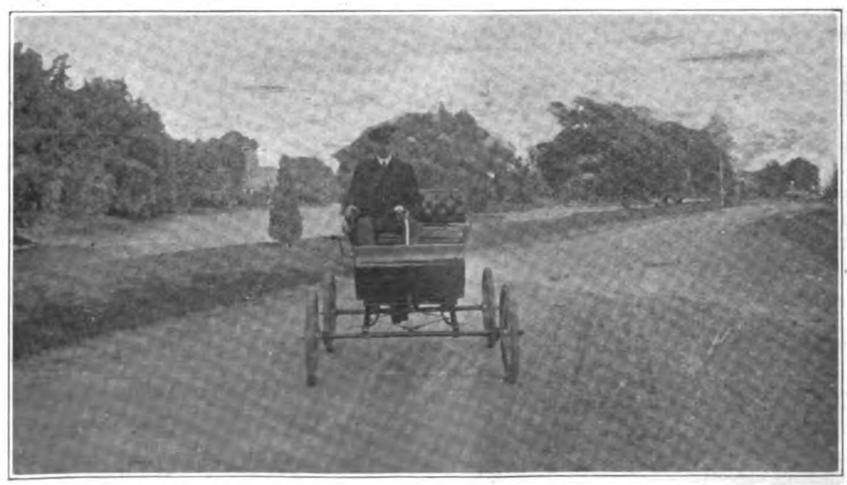
"Died at New York, on Thursday, 15th inst., at the home of Elijah Ward, Oliver Evans, Esq., of Philadelphia, in the sixty-fourth year of his age. His remains were interred yesterday afternoon."

He was buried in the old Zion Cemetery, but in later years the body was removed to Cypress Hills, where it now lies.

With good gasolene in the carburetter a car will give vastly better results than if a poor fluid were used. But the mixer that won't work in some fashion with a grade of gasolene much under 70 degrees would not be of a great deal of use outside of the large cities.

REVIEWED BY WILHELM

Berlin Show Opened With a Parade, Red Fire and a Solid Square of "Hochs!"



Preceded by a highly successful parade, reviewed by the Emperor and other notables, the Berlin automobile show was opened on Saturday. Although confined to German vehicles, it is regarded as far exceeding expectations. Indeed, it is held to reveal the really remarkable progress made by the German industry. Unlike previous exhibitions, it met with popular approval, a fact due in part to the official recognition bestowed upon it.

The exhibition is being held in the Flora Garden. It and the adjoining palm gardens presented a brilliant sight. There were manay handsome exhibits, conspicuous among them being those of the Mercedes, the Cudell, the Opel company, the Dietrich company, the Benz company, the Continental company, the new automobile company, the Argus. There was also a notable exhibit of automobiles employed in the German army.

More than three hundred beautifully illuminated and decorated automobiles were in the parade. The course extended from the west end of the race course through the Thiergarten, along the Unter den Linden to the royal castle in the Lustgarden.

In a monumental square, fronting the Schloss, the automobiles drew up with military precision. Upon the terrace of the palace the Emperor, Prince Henry, Prince Friedrich Leopold and a group of officers awaited the procession. The magnificent proportions of the William the Great monument were revealed in Bengal light.

After the automobiles had ranged up in a solid square the Duke of Ratibor called for "Hochs!" and while the band rendered a specially written automobile march he handed the Kaiser a handsome leather bound album containing the names of participants in the parade and numerous sketches.

OLDSMOBILING IN BELLE ISLE PARK, DETROIT.

The Week's Patents.

722,206. Steam engine. Byron J. Carter, Jackson, Mich. Filed Jan. 18, 1902. Serial No. 90,331. (No model.)

Claim.—1. In a steam engine, a cylindrical steam chest, a rotary shaft in the axis of one head of the steam chest, a rotary valve on the inner end of the shaft, means for rotating the shaft, an exhaust port in the axis of the other head of the steam chest, segmental ports concentric with the exhaust port, a reverse valve having a central exhaust port and segmental ports to correspond, with the ports in the head of the steam chest, a rod in the axis of the exhaust port and connected to the reverse valve and means for adjusting and holding the same, substantially as described.

722,223. Gas or gasolene engine. Bernt Garllus, Madison, Wis. Filed Dec. 7, 1901. Serial No. 85,105. (No model.)

Claim.—1. In an internal combustion engine, the combination with the cylinder, piston and admission valve, of an exhaust valve loaded to stand normally in its open position, a governor driven by the piston and co-operating with the exhaust valve to close the same at proper periods during the cycle of the engine when the speed of the engine is at or below normal, and means independent of its load for positively unseating said valve, whereby sticking of the valve on its seat is prevented; substantially as described.

722,224. Automobile. Leonard B. Gaylor, Newton Centre, Mass. Filed Dec. 6, 1902. Serial No. 134,066. (No model.)

Claim.—1. In a motor vehicle the combination of a motor supported otherwise than upon the body of the vehicle, an elastic platform which connects two transverse axles and holds them in parallelism, a seat mounted on the platform, wheels on the ends of the axles and means for operating two of said wheels for the purpose of steering.

722,243. Automobile carriage. William H. Noyes, Newburyport, Mass., assignor to Amos L. Prescott, Passaic, N. J. Filed Jan. 27, 1902. Serial No. 91,500. (No model.)

Claim.—1. The combination of a carriage body, a footboard pivoted to the front end of said body, a dashboard pivoted to the footboard, and supporting devices which maintain said footboard and dashboard in suitable relation to each other and to the seat when dropped down, said body having sides, the front edges of which are conformed to said dashboard and footboard, and against which said dashboard and footboard are adapted to be folded.

722,262. Motor vehicle. Roy Stone, New York, N. Y. Filed Aug. 1, 1902. Serial No. 117,932. (No model.)

Claim.—1. The combination with a motor vehicle of a merchandise truck or wagon, a means for connecting and disconnecting the same and for changing the relation of the parts as connected so that the adjacent wheels of the respective vehicles are raised clear from the ground.

722,278. Driving wheel for traction motors. Edward Boniecki, Kouzmincy, Russia. Filed July 11, 1902. Serial No. 115,194. (No model.)

Claim.—1. The combination with the rim of a wheel, of plates each comprising a section extending diagonally of the rim, a section extending transversely to the rim and a guard section arranged eccentrically to the rim.

722,309. Heating feed water for motor vehicles. William J. Lane and George Lane, Poughkeepsie, N. Y. Filed Jan. 29, 1902. Serial No. 91,738. (No model.)

Claim.—1. In a motor vehicle, the combination of a water tank, a steam generator, a pipe leading from the water tank to the steam generator, a drum inclosing a portion of said pipe and located below the level of the water tank, a source of steam connected to said drum, a pipe connected to the bottom of the drum and discharging into the water tank, and a discharge pipe leading from the drum, such pipe of the required size to normally create sufficient back pressure to cause the steam discharged into the drum to lift the water of condensation from the drum into the water tank.

722,330. Low water alarm for steam boilers. Freelan O. Stanley, Newton, Mass. Filed Oct. 25, 1902. Serial No. 128,726. (No model.)

Claim.—1. The combination with a boiler and burner, of a pipe below the boiler, a tube connected detachably with said pipe and containing a fusible plug at a point above the burner, and having its outer end open and exposed, substantially as described.

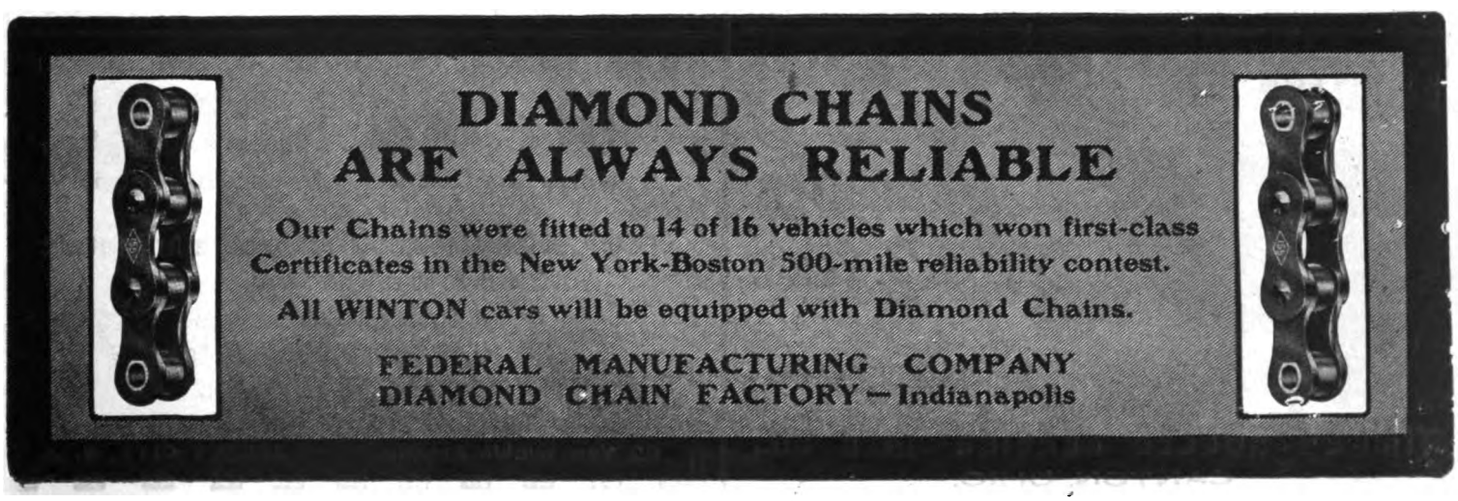
722,333. Electric igniting device. Friedrich Sturm, Stuttgart, Germany. Filed Jan. 20, 1901. Serial No. 44,894. (No model.)

Claim.—1. The combination with an electric igniter, and means for adjusting the moment of sparking of said igniter, of a generator arranged to supply an electric current to said igniter, and provided with an adjustable pole piece connected to said adjusting means, whereby the moment of sparking of the igniter and generator may be simultaneously adjusted.

722,339. Protecting band for pneumatic tires. John Wheeldon, Sheffield, England. Filed May 22, 1902. Serial No. 108,528. (No model.)

Claim.—1. An intermediate protecting band adapted to be inserted between the air tube and tread of a pneumatic tire consisting of inner and outer strips of fabric, and a layer of small plain sections of sheet metal fitted closely together side to side, end to end and edge to edge between the strips of fabric, and cemented together with the strips of fabric.

722,357. Carburetter for gas engines. Herbert A. Davis, Philadelphia, Pa., assignor to J. H. Brinton, Philadelphia, Pa. Filed March 1, 1902. Serial No. 96,224. (No model.)

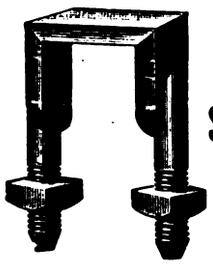


Claim.—1. In a carburetter, a rotary valve, a fuel conduit controlled thereby, a lift valve, an air conduit controlled by said lift valve, a stop connected with said rotary valve for limiting the opening of said lift valve in proportion to the opening of said rotary valve, said lift valve being adapted for closing said fuel conduit, substantially as specified.

722,431. Hydrocarbon motor. James W. Packard, Warren, Ohio, assignor to Packard Motor Car Company, Warren, Ohio, a corporation of West Virginia. Filed May 8, 1900. Serial No. 15,878. (No model.)

Claim.—1. In an engine of the class described, in combination, the pump barrel having lateral inlet and discharge openings, a piston reciprocating in said barrel, a plunger in said barrel arranged to be moved in one direction by the piston, an adjustable abutment arranged to move said plunger in the opposite direction, connections between said piston and said abutment whereby they are moved simultaneously, an operating lever, and connections between said lever and said abutment whereby the abutment may be adjusted relatively to the piston while the engine is running.

722,440. Piston ring. Walter G. Wilson, Westminster, England. Filed June 23, 1902. Serial No. 112,916. (No model.)



Claim.—1. The combination with a piston, of a split piston ring thereon having recesses in its ends, a spring as wide as the ring lying freely between it and the piston, a tongue formed integral with the spring to rest in the recesses in the end of the ring.

G & J TIRES

merit the attention of all who are looking for "the best tire" and will not be satisfied with anything else.

We make no noisy generalizations, which, like rockets, explode with much commotion, but end in nothing but vanishing smoke,

The proof lies in the unanimous verdict of satisfaction rendered by their users ever since pneumatic tires were first introduced, and in their great and constantly increasing use everywhere, which proclaims them to be of the highest quality that skillful workmanship and best material can produce.

"Only Known Values are Imitated"

Do not be misled by imitations. Demand the "G & J." and money will be saved by getting more wear with fewer repairs.

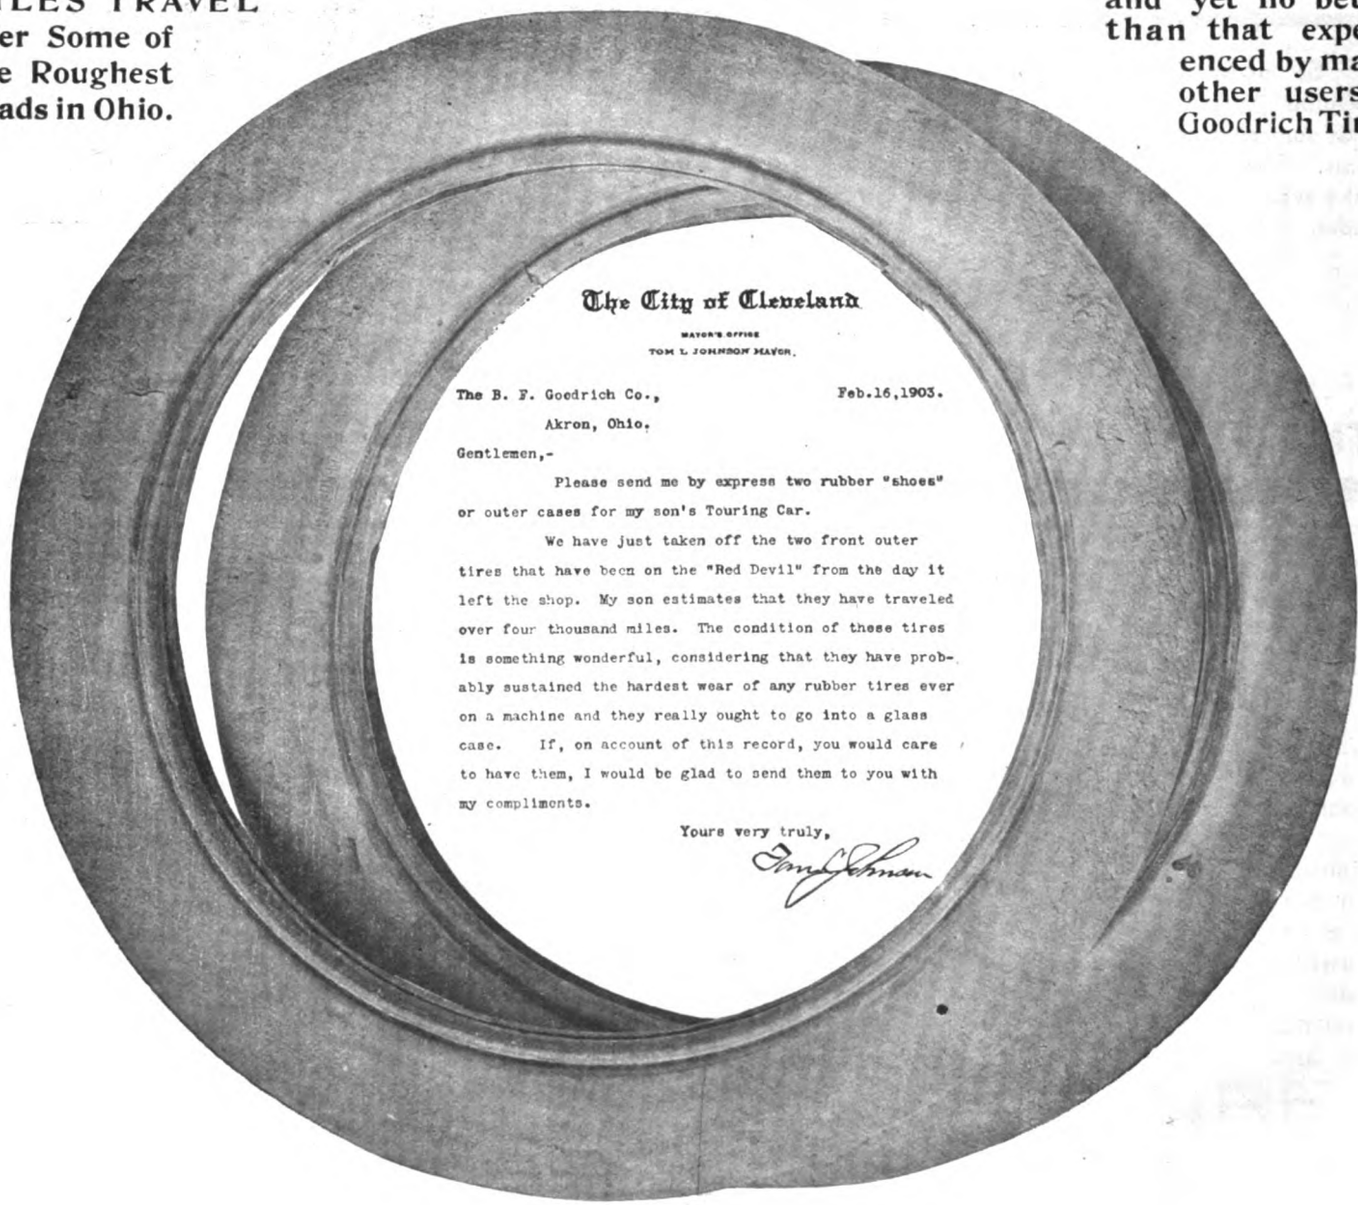
"THE RED DEVIL" AND THE TIRES THAT EQUIPPED IT.

The Honorable Tom L. Johnson Tells His Experience

—WITH—



Goodrich Clincher Automobile Tires

As Equipment on the Famous "Red Devil" Touring Car.

FOUR THOUSAND MILES TRAVEL Over Some of the Roughest Roads in Ohio.

READ THE LETTER!

A wonderful record and yet no better than that experienced by many other users of Goodrich Tires.

The City of Cleveland

MAYOR'S OFFICE
TOM L. JOHNSON MAYOR.

The B. F. Goodrich Co., Feb.16,1903.
Akron, Ohio.

Gentlemen,-

Please send me by express two rubber "shoes" or outer cases for my son's Touring Car.

We have just taken off the two front outer tires that have been on the "Red Devil" from the day it left the shop. My son estimates that they have traveled over four thousand miles. The condition of these tires is something wonderful, considering that they have probably sustained the hardest wear of any rubber tires ever on a machine and they really ought to go into a glass case. If, on account of this record, you would care to have them, I would be glad to send them to you with my compliments.

Yours very truly,

Tom L. Johnson

The above cut is a true picture of the tires referred to in Mr. Johnson's letter. No attempt having been made to retouch the photograph or obliterate in any way the marks of wear.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, March 26, 1903. No. 26

NEW JERSEY BILL PASSES

Amendments Favored by Automobilists Accepted by Legislature—The Law in Full.

By the passage in the Senate last week of the so-called Scovel bill, and the affixing of Governor Murphy's signature thereto on Monday, New Jersey now possesses a law that is as simple and equitable as any legislature can be expected to pass to-day. In some respects it bears hardly upon motorists. But in the main it justifies the pronouncement of the Automobile Club of New Jersey, which organization, with W. E. Scarritt at its head, did the lion's share of the work of having the law placed on the statute books. That pronouncement is that the act is, both from the standpoint of road protection and from the viewpoint of the automobilist, a modern as well as scholarly scheme of automobile legislation.

The bill requires the registration of all automobiles with the Secretary of State—those of non-residents as well as those living in New Jersey—and the carrying of numbers on the vehicle and on the lamps. The fee is $1. These formalities complied with, no others are required; there is no licensing and no interference by local authorities, except on speedways and in parks. There local regulations apply. Arrests for violations of the law shall be made only in case racing is indulged in. For other offences complaints must be lodged with magistrates, and the latter shall conduct a trial. An appeal from their decision may be taken before the county courts.

The speed provisions of the bill were given in these columns two weeks ago. They are twenty miles an hour in the country, eight and one-half miles (one mile in seven minutes, to be exact) in cities and towns, and ten miles at crossings and sharp turns in the country. These rates are uniform throughout the State, and cannot be nullified by local ordinances.

The bill in full follows:

AN ACT defining motor vehicles and providing for the registration of the same

(Continued on page 995.)

Discontinues Motor Manufacture.

The Motor Vehicle & Power Co., Philadelphia, have discontinued the manufacture of motors. They have leased the building at Sixteenth and Wood streets formerly occupied by Banker Bros, and will conduct an automobile sale and storage business. Arrangements have been made to handle the Cudell cars, and the Darracq line will probably be added also.

Dyke Becomes a Company.

To properly look after the expanding business of A. L. Dyke, St. Louis, Mo., a corporation has been formed to take it over. The A. L. Dyke Automobile Supply Co., Inc., is the title of the new concern, of which A. L. Dyke is president. The business will be conducted as before, but on a more extensive scale.

Moore to Quit Westfield.

The C. J. Moore Co., Westfield, Mass., is considering the advisability of discontinuing the automobile business. President Moore has resigned, and will leave the town, hence the probability of the action referred to. The directors will meet shortly and come to a decision.

Joyce Joins the E. V.

J. J. Joyce, former manager of the International A. & V. Tire Co., has engaged with the Electric Vehicle Co. Before going into the tire business he was connected with the Electric Vehicle Transportation Co., so that he is not an entire stranger to his new duties.

Typhoid Attacks Morrison.

A. E. Morrison, who so recently left the Peerless factory at Cleveland to assume charge of the company's new branch in Boston, is down with typhoid fever. The attack is not a severe one, however, and no bad results are expected.

Mc Murtry With Berg.

The forces of the Berg Automobile Co. have been strengthened by the acquisition of A. L. McMurtry, of the late firm of Adams & McMurtry. Mr. McMurtry will divide his time between New York and Cleveland.

PLANS OF THE CHAUFFEURS

Private Car Men to Separate Themselves From Operators of Hacks and Organize.

The chauffeurs have been having a hard time of it getting together in harmonious organization, but the proper plan seems at last to have been hit upon. This is that of a few men of the first class variety organizing as an incorporated club and formulating the examinations to be passed by those who desire to join. This seems to be the only way out of the difficulty because the crowd present at a mass meeting is of too mixed a character to permit of agreement on the grading conditions. The unqualified men would not agree to strict examinations, and unfortunately the unqualified are always in a majority at a mass meeting. So this is the solution to the problem that has been decided upon. The success of the plan depends upon the character of the incorporators and of the examination prepared for members. If these have the approval of the Automobile Club of America and the National Association of Automobile Manufacturers the incorporated club can "stand pat" and the chauffeurs will be practically obliged to join.

Another subject that agitates the chauffeurs just now is that regarding the name by which they shall be known. They are weary of the imported misnomer chauffeur, because it is imported, because it is not descriptive, because it is used here to mean the hired man, while in France it applies to the gentleman operator, while the hired man is called a mechanician, and, finally, because while the modern meaning of the word is stoker, some of the men have learned that earlier it meant robber. It has been proposed to substitute the term "automobile engineer" for "chauffeur" and call the organization the "National Association of Automobile Engineers," or some such name.

These things have developed since a mass meeting that was called and held last week at the Mobile station at No. 1,713 Broadway. The call for the meeting stated that it was

Digitized by Google

for the purpose of forming a club. A few active spirits, notably Van Allen Soule, E. E. Hawley and Samuel Brock, conceived the idea of having a club in which the members would be divided into four grades, according to ability and experience.

About eighty were present at the meeting, and Joseph Kane, chauffeur for William Guggenheimer, was elected temporary chairman, while L. H. Warren was chosen temporary secretary. There were some decidedly humorous passages at the meeting, and a wonderful absence of parliamentary procedure, but there was an earnest tone to it all that boded well, although there was a manifest feeling of antagonism on the part of the men who operate private cars toward those employed on public vehicles.

After a discussion the following were named as a committee to draw up "resolutions" showing a plan for a club, not on the lines of a trade union, the union idea being honestly repudiated by all: E. E. Hawley, Van Allen Soule, Samuel Brock, Fred Rankin and W.. Van Vahn.

After this committee had been appointed suggestions were invited, and it was agreed that a tentative constitution and set of by-laws which had been prepared by the promoters of the meeting should be read without interruption. After the reading these were loudly applauded, and as they were drawn up by the same coterie of men who later mapped out the independent move, they are fairly indicative of what is the plan of organization.

Excerpts from this tentative constitution and by-laws follow:

The name of this club shall be the "American Chauffeurs' Club."

Its object shall be to promote the chauffeurs' profession by their examination and classification according to their ability, experience, reliability and integrity; and the issuing of certificates to its members by a competent board showing to what grade the holder belongs, thereby making it necessary for a man to be fully qualified for a position before the club will recommend him for a place. By so doing the club hopes to instill into its members the desirability of constantly striving for a first-class certificate, and at the same time protect the automobile owners against imposters and men who are incompetent to fill positions of trust.

A Board of Governors shall be elected at the annual meeting consisting of ten members in good standing, in addition to the President, the officers of the club forming six members of the board.

The President shall appoint a Committee on Credentials, consisting of five members holding first-class certificates. This committee must be ratified by the Board of Governors. Should any nominee be rejected the President will submit another name to the Governors for their approval.

The Committee on Credentials shall pass upon all applications for membership, and upon their recommendation only shall an applicant be eligible to membership, his classification being fixed by the committee.

The Board of Governors by a majority vote may elect applicants to membership who have been passed and recommended by the Committee on Credentials, provided they are over twenty-one (21) years of age.

The President will have issued to all members a card properly indorsed, showing to what grade such member has been admitted.

The dues will be five ($5.00) dollars per year, payable in advance.

The Board of Governors will have the power to suspend either temporarily or permanently, any member they may deem obnoxious to the general good of the organization; providing, however, that charges have been formally made in writing against such member and notice sent him of such charges and an opportunity given him to be heard upon said charges, if he so elects.

The Corresponding Secretary will keep on hand at all times a correct list of all members, their grade, &c., and will, upon application from an automobile owner, supply the names of all men desiring positions who are, according to their grade shown by their certificates, fitted to fill the position open.

It will be necessary for the applicant to state his experience fully. Whether he is a machinist or not. Whether he drinks to excess. Whether his eyesight and hearing are good.

He must also furnish a list of the persons he has worked for, the length of time engaged by each, class of car operated, and cause for leaving.

The Committee on Credentials will investigate each applicant according to his own statement and will satisfy themselves that the applicant's claims are founded on fact. They will then satisfy themselves as to his ability before recommending him to the Board of Governors for a given grade of membership.

A member may stand examination for a higher grade every three months. If he fails to pass, he cannot again try examination for a similar period.

The Governors may, by a two-thirds vote, elect as honorary member any person who has been of unusual benefit or service to the American Chauffeurs' Club or the cause of automobiling. Such members will enjoy all the rights of a first-class member except that of voting.

The meeting adjourned to meet again and receive the report of the special committee appointed on Wednesday night of this week at the same place, but no sooner was the meeting over than the new movement referred to was inspired by the talk of dissatisfaction on the part of the private car men. This culminated by having papers of incorporation drawn up with the intention of having the committee that was appointed report back that they now represented an incorporated club, and that those who desired might apply for membership.

The reason for this action on the part of the leaders was expressed by one of them as follows:

"We do not want that transportation crowd with us, nor any of the men who are simply electrical operators. Their interests are not the same as ours, and no satisfactory organization could be perfected in open meeting, because they would not permit the adoption of any plan of grading that would put them in a lower grade where they belong. The electrical operators are not mechanics or engineers, but simply push button men. They have only to know enough to pull a lever and steer and read a gauge clock. They do not have to be mechanical any more than an elevator man. A man who can run a big four cylinder gasolene car and take care of it properly in the stable and on the road has got to be an engineer, just as much as a man on a locomotive, and they should be called automobile engineers. The electrical men belong in another class. They could not pass an examination, such as should be fixed upon for members of the first grade, and if allowed to have their say in a meeting where they are in a majority the whole thing will be a fizzle. It is easy to pick out ten or a dozen good men who really are thorough engineers and mechanics, and who have had years of experience with automobiles and can pass any sort of an examination. Let them get together and incorporate a club, and after the conditions of grading have been fixed and the automobile club approves of them, why the other men can come in or stay out as they like. They will have to accept the grading condition if they come in, and it will be their own loss if they stay out. The conditions for the first grade should be very strict. A man to be eligible should be able to prove at least a year of experience as a mechanic and a year of experience in handling a machine. He should be obliged to pass a rigid examination of questions concerning the parts of the machine, should be made to prove that he not only can steer and drive one, but can set up, adjust, oil and put into working condition a machine that has been fixed up for him by the committee. Then after the practical examination there should be one of theory. I say theory, but I don't mean what many men may think; no text book questions or anything like that, but a suppositious case to a man of an accident on the road and ask him what he would do under such conditions. He would not have to have 100 per cent on this feature, but he should be able to show that he would know what to do in an emergency. The theoretical questions of this sort could be framed up from the experiences of the examiners. For instance, it is often possible to get a broken machine home instead of leaving it in a shop or putting it on a train, if only as man knows enough about the engine. I know I broke a connecting rod, but I knew how to strip the engine enough to run home on two cylinders, while the boss took the train. Ability to do such things saves time, trouble and money."

Florida Races "Go"

Just when the situation seemed most unpromising for the Florida automobile races the sky cleared and obstacles disappeared as if by magic. W. J. Morgan, promoter in chief, returned from the West, and almost simultaneously W. J. Stewart, chairman of the race committee of the American Automobile Association, took action in the matter of a sanction for the races. The Florida Automobile Association and the Daytona Automobile Club were granted a joint sanction for a race tournament on the Ormond-Daytona beach on March 26, 27 and 28. This ended a struggle between the two clubs, and both will co-operate in the promotion.

The programme will include a floral parade, trials against time and races, both automobiles and motor cycles participating. The appearance of Alexander Winton, with his famous "Bullet," is assured, the car having been shipped to Daytona last week, and a number of other flyers are expected to be on hand and take part. Strong efforts will be made to replace the present mile record of 46 seconds with new figures, and it is thought that on the smooth beach they will be successful.

There is no truth in the report that an Oldsmobile racer has been built. The Olds Motor Works write the Motor World to this effect, adding that they "have not time to take up anything outside of our regular line."

BUDLONG ON CONDITIONS

No Clouds on Trade Horizon, He Says, and Exports are Expanding Encouragingly.

With his habitual courtesy Vice-President and Treasurer Budlong of The Electric Vehicle Co. replied at some length to the question as to the season's outlook put to him by a Motor World representative last Saturday during one of his visits to this city.

"The outlook is a splendid one," he said. "We are far ahead of last year, our order books show, and our only anxiety is as to turning out the goods fast enough. The vehicles are coming through in good shape, and in a few weeks our output will be much increased. Our trouble is that there is so much special work. Many of our customers want their broughams or coupes or laundaus built with some special features of their own incorporated, and they feel that when they pay $3,000 or $4,000 they should get these. But we are doing our best to cope with the influx of orders we have received, and really have no reason to complain.

"How about Columbia gasolenes? Well, we shall have a sample car here before very long, anad others will follow fast, as there are forty cars coming through together. After that, of course, the task of turning them out will be a much less difficult one, for everything will be going smoothly in the gasolene department, and the work will come through much more rapidly.

"So far we have made no real effort to sell gasolene cars. The comparatively small number we shall build this year will be disposed of without any difficulty."

"Our foreign trade in electrics has been very good this year, too. We are making large shipments of gears—you know, we send the vehicles abroad without bodies—to England regularly. The electric type is much in favor there, and our sales amount to hundreds of thousands of dollars annually. In France our trade is not quite so good. French automobilists incline more toward the gasolene type of car, and the electric has a much more limited sale. Still, our agents in Paris do a good business for us, and one that is steadily growing."

Electric Storage Battery Affairs.

Last week the annual meeting of the Electric Storage Battery Co. was held, and P. A. B. Widener, William L. Elkins, Thomas Dolan, George D. Widener, Rudulph Ellis, Grant B. Schley, George I hiller, Thomas J. Regan and Herbert Lloyd were re-elected directors. The sale of the Derby Lead property and the purchase of the Chloride Electric Storage Battery Co., Ltd., of England, were ratified. President Lloyd denied that agents of the General Electric Co. had ever looked over the plant of the Electric Storage Battery Co., and said that the subject of the absorption of the Storage company by General Electric had at no time been considered by the directors.

The president mentioned incidentally that the Storage company during 1902 had done nearly 95 per cent of the battery business of this country. It also transpired that the company owns about one-third of the stock and the same proportion of the bonds of the Pennsylvania Electric Vehicle Co.

The most important matter brought out at the meeting was the plans of the Storage Battery Co. for the development of the Chloride Electrical Storage Co., Ltd., England, which has been recently taken over.

Turner! Turner! Who's Turner?

Business men of Geneva, N. Y., are agreeably exercised over the possible location of a $1,000,000 automobile factory in their midst. The secretary of the Chamber of Commerce is investigating a proposition presented by Charles E. Turner, of Brooklyn, relative to locating the plant.

Mr. Turner was in Geneva and informed the directors of the Chamber of Commerce that all that would be asked of Genevans will be to subscribe for from $15,000 to $20,000 worth of the stock. The remainder, he asserted, could be secured in New York.

The officers of the Chamber of Commerce will investigate the subscription of the stock and also make arrangements for the meeting of incorporation.

And Decker! Who's Decker?

The Binghamton, N. Y., Board of Trade has under consideration an offer from the Decker Automobile Co. to establish an automobile factory in that town. The Decker company asks that Binghamton capitalists subscribe $20,000 to a stock company. They will put in all the machinery for the plant, which will aggregate in value $10,000, as their part of the stock. They do not ask for a site, but wish to secure a machine shop which is already equipped.

Vindex With one Million.

The Videx Automobile Mfg. Co., which was recently incorporated under the laws of New-Jersey with $1,000,000 capital, has purchased the land, buildings, stock and business of the Marlboro Automobile and Carriage Co., at Marlboro, Mass. Orrin P. Walker, of Marlboro, who was the head of the latter concern, is president of the new company. Work will be prosecuted on a much larger scale than before.

Have Purchased Motsinger's Patent.

The Standard Motor Vehicle Co., Chicago, whose four cylinder horizontal engine has given rise to some little comment, has purchased of H. N. Motsinger, Pendleton, Ind., a patent on a multi-cylinder horizontal motor which he owned, and which, with their own, they maintain, places them in control of that type of motor. The chief claim for this form of engine is its freedom from "poundnng" and other vibration.

EFFECTS OF ALTITUDES

How Rocky Mouutain Air Affects Motors and the Constructional Changes Made Necessary.

Denver and the Rocky Mountain country thereabouts, as was remarked in the Motor World last week, make peculiar demands on motors.

Denver has an altitude of 5,280 feet, but most of the automobiling is done at an altitude of about 5,800 feet, which corresponds to the barometric pressure of 24 inches instead of 30 inches, as at sea level, a reduction in air density of 20 per cent, which means that a gas engine to have the same compression there as at sea level should have the area of the clearance or mixing chamber reduced 0 per cent, and that wherever valves or floats are lifted by partial vacuum instead of by mechanical means their weight should be cut down 20 per cent. At an altitude of 5,800 feet the boiling point of water is only 201 degrees Fahrenheit, instead of 212, as at sea level, which indicates that the cooling surface of the radiator or amount of water should be increased 5.2 per cent to obtain the same reserve cooling effect that you would have at sea level.

In crossing the divide between Denver and Colorado Springs, which has an altitude of nearly 6,000 feet, many of the best cars have all they can do to climb the grade, due to loss of power from decreased compression and improper mixture, due to too heavily weighted floats.

Walker is Opposed to it.

The name of John Brisben Walker has been connected with the bill introduced in the legislature of this State by Senator Foley, giving privileges to companies operating stage lines. Mr. Walker writes the Motor World stating that he is "utterly opposed" to this bill or any other giving exclusive privileges on State highways. He thinks these highways should remain open to those who can give the best service.

Big Japanese Company Formed.

The Japan Automobile Co., with a capital of $500,000 (1,000,000 yen) has been organized in Tokio to operate a public bus line. Several wealthy merchants of the city are interested in the enterprise, which may eventually go into the assembling of cars. The company has not yet decided what power it will employ, but has an agent in this country who is investigating the subject.

Removes to Bridgeport April 1st.

As was stated some weeks ago, the Locomobile offices in this city will be closed on April 1. President Davis, Advertising Manager Kingman and the major part of the force will go to Bridgeport. Treasurer Thomas H. Thomas, with the accounting department, will take up quarters at the salesroom and garage at No. 126 West Seventy-sixth street, this city.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, MARCH 26, 1903.

The Matter of Garage Charges.

With the approach of the touring season the matter of garage charges, and particularly those for storage alone, assumes importance and timeliness.

It is undeniable that there is a very general disposition to regard automobilists as fortunate persons, plentifully supplied with this world's goods. The widespread appellation of "millionaire automobilists," applicable to the few, is made to serve for the many. Lavish expenditure is in consequence expected, and sometimes demanded. Prices double or quadruple, and the motorist who becomes restive under them is looked upon as a "cheap skate," who has broken into a game that should be given over to "his betters."

Such is the belief entertained outside the "charmed circle" of automobiling. It is even shared in some degree by those inside. The "tariff" for ordinary people is deemed too low for motorists. A lordly disregard for money is one of their supposed attributes, and in many quarters care is taken that it is lived up to.

If we turn to garages we find that this is true in the main. The driver of a horse drawn team can put up at a livery stable, and, although charged transient rates, get off with a charge of 25 cents for storage. Attendance and supplies are charged for at proportionate rates. Fixed rates prevail as a rule, and if they are sometimes increased the additional impost is so slight as not to be seriously felt. Tip schedules likewise vary very little, if any.

But turn to the automobile, and it is found to be quite another story. Up, up go the rates, and if the tips are not given out on a liberal scale the motorist is looked upon as a niggard, and is lucky if he is not openly reviled in consequence. He gets no 25 cent storage rates, even if, in the absence of a regular garage, he puts up at a regular livery or in some outhouse connected therewith. Rarely will he get off with less than $1, and sometimes the owner has the effrontery to demand more. In so doing he simply follows the example of the garage proprietor. The practices of the latter are familiar to the former; and for poor accommodations the motorist pays the price of good ones.

As to the garage practices opinions must differ regarding them. Is $1 an excessive sum to charge for keeping an automobile overnight, supplies and attendance being extra? Judged by livery stable practice, the standard charge being 25 cents, it is exorbitant. But in view of the extra expenses of the garage keeper, his high insurance rates, his more limited and fluctuating patronage, etc., this is not so obvious.

It will scarcely be disputed, however, that a $1 charge is ample. Yet we have known $1.25, $1.50 and even $2 to be demanded and obtained, with other charges in proportion.

These and other garage problems confront every motorist who makes use of them as transients. He finds that treatment differs, but that he gets the worst of it in nearly all cases. He is certain sooner or later to demand a reform. A wise course would be to forestall the demand.

Why the Commercial Contest.

The Automobile expresses guileless wonderment that the Automobile Club of America should persist in its promotion of the commercial vehicle test despite the disapproval of the National Association of Automobile Manufacturers.

What has caused more wonderment to nearly all other papers and people was the action of the Association in disapproving the test after several of its leading lights had responded to the club's courteous invitation and promised their support and approval.

The Automobile also appears to fear that the contest may not be sufficiently technical, which, to our mind, is one of its virtues. At this stage of the industry nothing is to be gained by too-exhaustiveness. The rules as drawn are ample to meet present conditions. They will abundantly meet the chief purposes to be served—the drawing of public attention to the automobile for commercial uses and forcing the trade generally to do more than reduce the motor wagon to blue print designs.

The commercial vehicle is the bulwark of the trade. In turning on the invaluable light of publicity and in forcing the fact down the trade's throat before the trade is ready to swallow it, the Automobile Club is helping the trade in spite of itself and performing also a genuine public service.

Boston's and Other Local Shows.

A striking lesson is afforded by contrasting the recent local show in Boston with others held in other cities. In Boston the dealers formed an association and ran the show themselves. They advertised liberally in the local papers, engaged an able press agent, and the consequence was that the whole city was stirred up with automobile talk. Interest in the motor vehicle had been somewhat lagging in the Hub until this spring, but during the show of the dealers' association there last week the automobile was the subject uppermost in social and business circles, as truly as it was in New York during the week of the national show.

The advertising and the consequent news notices aroused the interest of the whole city. Because the papers were full of it the show became the big event of that week for all the smart people of the city. When the doors opened on the first night there was a crowd of fashionable people waiting to enter Symphony Hall. Persons of wealth and fashion continued to go to the show all the week, the interest waxed up to the buying point, and many machines were sold.

When the show was over it was found that all the exhibitors had done a fair business. They were more than repaid for their outlay of cash for advertising and exhibition space, and also for their time and trouble.

Digitized by Google

Besides the immediate business done, a new interest in motor vehicles was aroused which will bring a steady flow of business all the rest of the year. On top of these things was the fact that a handsome profit had been made by the dealers' association, to be divided pro rata among the members or used by the association to further promote automobile interests in Boston.

Compare a show of that sort with some others that have been run by individual promotors in some other cities—it is unnecessary to mention names. The promoting persons were on the scent of private "graft." They would not spend any money of consequence in advertising, and they did not inspire the dealers with enough confidence to lead them to be liberal in this respect, although the dealers wanting a show were easily induced to buy space. What was the result in this case?

There was a poorly attended show. If not absolutely "frosty," there was a lack of warm interest, of the buzz and stir that inspire both buyers and sellers. The business done was small, no lasting impression of the progress of motor vehicle making and using was effected, and the show closed with the promoters gloating over a small profit, the dealers wondering whether it had paid them to go in, and more than half the city unaware that anything of note had transpired.

The public exhibition must be heralded to the public, and well heralded. In these days of extensive advertising, printers' ink should be spread liberally to make automobile shows a success. You cannot get something for nothing, and to get out a crowd to an industrial exhibit a big stir about must be made. This can be done if the dealers unite and run the shows. It is to be remembered that getting the public to pay an admission to see the cars is considerable of a stroke of finesse, because it is so much like a storekeeper charging customers entrance money to his shop. An event must be made of the show, and this cannot be done by individual promoters. The dealers themselves should run all local shows. They should spend money liberally in making them successful, and then have the profits to reward them for their enterprise and sagacity.

Solving the Chauffeur Question.

Ever since the timely expose of the chauffeur problem by the Motor World two weeks ago, the subject has been the one uppermost in automobile circles in New York city. The good done by the threshing out of the question by this paper has been made plain by the activity now manifest in efforts to solve the problem.

As a result of the rapid developments of the last fortnight, a rare opportunity is offered right now for a partial solution of the matter. It is rarely that any such chance has been offered for employers and employes to unite in an amicable shaping of their mutual interests.

The chauffeurs, or automobile engineers, as they prefer to be called, have discarded all idea of forming a union and are anxious to organize in a way that will permit of their being assorted into grades according to ability. This is something wholly commendable. It is to the interest of automobile owners who employ chauffeurs that this should be done. It is to the interest of automobile manufacturers that this should be done. The Automobile Club and the National Association of Automobile Manufacturers should take active parts in helping to launch this organization on lines that will be of benefit to all.

If properly formed an association, such as the men now propose, would go a long way toward taking the place of the schools for chauffeurs that have been considered desirable. In fact, such an organization would be a school for chauffeurs. The men in the second, third and fourth grades would be schooling themselves to get into the grade above. They would be helped by their friends higher up to qualify for higher grades. There would be an unusual and a constant incentive to self-improvement.

The great thing necessary is that the requirements for first grade, second grade and lower grade men should be sufficient to satisfy the owners and the manufacturers, and that there should be assurance of the examinations for the various grades being thoroughly conducted. If this was to be relied upon, the owners could unhesitatingly take a man of any desired grade for a place and be certain of what they were getting.

The way to insure these satisfactory conditions would be for the owners and makers to be actively identified with the organization by representation. The men seem willing and anxious to have the support of the club and of the manufacturers. These organizations should have committees co-operating with the men. The examinations proposed for the various grades should be officially approved by the club and the manufacturers. The owners and makers should have a representation on any examining committee, in order that there never could be any question of a man holding a first grade ticket in the association when he was not entitled to it. This would be true co-operation and beneficial to all. The men have shown themselves willing to seek the approval of the owners and the makers. It is to the interest of the latter that it should be given. The men will co-operate if the club and manufacturers will. It is a rare opportunity.

In order that the organization may be properly launched a joint committee from the club and the N. A. A. M. should be formed at once to work with the organizers. The incorporators themselves should be graded by passing an examination before a board composed of men selected jointly by themselves and the joint committee. Then if only first grade men were eligible to hold office and if the joint committee of the N. A. A. M. had representation on the "Credential Committee" it should be an ideal co-operative body of "capital and labor."

It is a rare opportunity.

Not the "Best and Fairest Bill."

In emphatically proclaiming the bill just passed by the New Jersey Legislature as "the best and fairest automobile law in the United States," Mr. W. E. Scarritt, who resides in New Jersey, is evidently carried away by state pride. As a matter of fact the "best and fairest law" is easily the one that prevails in Connecticut. It does all and more than the Jersey bill does, and in just about one-tenth the number of words. None should permit Mr. Scarritt's over-enthusiastic praise of the New Jersey measure to influence them into accepting it as model automobile legislation, for it is nothing of the sort. Connecticut's is the only really sane law in the United States, if not in the world.

With the coming of the noiseless gasolene car, which is confidently predicted, automobiling will be minus one of its picturesque features. The regular chug-chug of the exhaust has become almost a part of the vehicle, and unless it is particularly noisy it is not regarded as disagreeable.

Spring deliveries are still belated, although some shipments are being made all along the line. If the expected rush of buyers materializes it will tax the factories to meet it, even though they have cars "coming through" in big bunches.

Commentary

Of course you have all had enough and a plenty of show stories, but here's a good one which has but just reached me, and I don't want to keep it until show time next year, so tell it now. A certain manufacturer, whose opinions of newspaper men is none too flattering and who has always refused to give them either countenance or advertising, was talking to another man in the trade during the recent Chicago show. "How is it," said the non-believer in the newspaper confraternity, "that you and your machines are constantly being kept before the public? I hired a man who said he could do it for me, paid him $50 per week to do it, and I'll be hanged if I ever got five dollars' worth of notice. I'd like to know how you manage it."

"Well," said the second man, "I'll tell you. You see, I know all of the writers and when they come around I generally try to have a bit of news or a cigar for them, and whenever I can I give them an advertisement. When they can return the favor they do so, and there you are."

The first speaker thought awhile and then confided to the second one his desire to change his tactics at least during the time the show was on, and an agreement was made then and there for a meeting between the erstwhile press despiser and the despised pressmen. As soon as this had been accomplished the manufacturer whose advice had been sought looked up some of his friends among the writers, and there was a lot of whispering and smiling done between them.

Promptly at the time set the manufacturer who wished to win over the newspaper men was on hand and was introduced to eight of the leading press representatives. After a few common places the seeker after the pressmen's favor asked the writers if they wouldn't have some cigars and they declared they would. Here was where the plot thickened. Over to the hotel cigarstand stalked the ten, and the host invited his guests to chose their own brands. Strangely enough the cigar man seemed to know just what was wanted, and the box he placed before the newspaper men had about as fat and as black cigars in it as anyone ever saw. Each man took one, though none seemed anxious to light up, and on one excuse or another thanked their host and strolled off, leaving him still talking to the manufacturer who had brought about the happy gathering. Putting his hand in his pocket the man who thought he had won the publicity makers over at the price of a cigar each, said to the man behind the counter:

"How much do I owe you?"

"Ten dollars," was the answer.

"What! Ten dollars for ten cigars?"

But there wasn't any good kicking, the newspaper people had each taken a dollar cigar and the host and his friend were also smoking one of the same expensive kind. The buyer of publicity paid; he wasn't happy and he never tried in any other way to capture free press notices. Later on the newspaper men turned in their dollar cigars to the cigar man and received in return for each one of them eight two-for-a-quarter cigars. Some way it seemed as though there was an understanding to that end between the owners of the dollar cigars and the seller of them, but, of course, no one can prove that.

* * *

The man who is eternally kicking about his own troubles is generally the one who wants to ride to glory in some other fellow's conveyance.

* * *

There is none who so thoroughly appreciate the trotting horse owner's modesty and forbearance toward all other users of the public highway as I do. I believe I have made this statement before in commenting on the trotting man's lack of arrogance which one would naturally expect from a man for the sole pleasure of whom a city has set apart a magnificent speedway, and to whose demands first attention is always given on all parks and elsewhere. Any other than a trotting horse owner would be inclined to become, as the late Chief Devery would say, "chesty," over such deference to his importance, but does the horseman? No, indeed; he takes it all as his divine right and lets it go at that. Now, don't think I am prejudiced in this matter, because, of course, I am not, but if you think otherwise here's what the president of the organized trotting horsemen said to his fellow road drivers on the occasion of his recent re-election:

"You are the slowest lot of men organized in the city of New York to-day. Here we are, six hundred strong, and can get the influence of every district leader's vote in this town, and yet we dicker how we'll support our Speedway. The trouble is we don't demand our rights; we ought to be able to make so strong a showing that the powers of the legislature could not refuse our demands. A $4,000,000 Speedway has been left to us to enjoy, but we are afraid to ask what we need to keep it up. Now, I promise you if you will back me up that I will be able to get this coming year a $75,000 or a $100,000 mansion as a clubhouse that will be representative of the Speedway.

It isn't just plain from this whether the city or the State is to give the trotting horse gentlemen this clubhouse so he may rest himself after the hard labor of driving his horse over his $4,000,000 Speedway. But what does it matter? In any event you can see that there isn't the slightest danger of the trotting horse owner ever demanding what he considers his rights, and that, too, when he is absolutely sure of "the influence of every district leader's vote in this town." Now, if for trotting horse you were to substitute automobile in all this, what do you think would happen? War, devastation and sudden death would indeed be mild misfortunes when compared with the things which would be pictured as close at hand by every scare-head editor in the land.

THE COMMENTATOR.

Patching the "Protectors'" Bill.

The bill of the Protective Association of Long Island now pending before the New York State Legislature has at last been tinkered into such shape that President Shattuck, of the Automobile Club, has promised it his support. Besides providing for every automobilist being licensed by the State for a fee of $1, it stipulates that no local authorities may lessen the rate of twenty miles an hour speed in the open country, or fifteen miles an hour in suburban districts where the houses are more than 100 feet apart, or eight miles an hour in built-up portions of cities and towns. Motor cars must stop on signal from horsemen, and when doing so the churches must not be passed faster than eight miles an hour while a session is being held in them, nor may horses or foot passengers on the highway be passed at a greater rate of speed. It provides for suspension of the license for two weeks for a first offense, a suspension of the license for one month for a second offense and revocation of the license for a third offense in addition to fines and discretionary imprisonment. The penalties apart from suspension of road privileges are: First offense, a fine of not more than $50; second offense, a fine of from $50 to $100, or imprisonment for thirty days; third offense, a fine of from $100 to $250 and imprisonment for thirty days.

Cup Race in Ireland now Certain.

News that the bill authorizing the Gordon Bennett cup race to be held in Ireland had finally passed the British House of Lords on Tuesday, was welcomed here, and also the news that the Hon. John Scott Montagu has offered a trophy for second prize in the race. The American team will not go over to capture the second place cup, not a bit of it, but if they should happen to miss winning the first prize by a small margin it will be consoling to have something to show for the effort made. It is cabled also that about thirty miles of poor roads have been cut out, thus shortening the course to just 100 miles. This will be traversed three and a half times, making the race one of 350 miles. The bill permitting the race has now to go back to the House of Commons, which it previously passed, to have the amendments approved, but no opposition is anticipated, and it is practically settled that the race will be held in Ireland early in July. The Automobile Club of Great Britain has recently written a letter to the A. C. A. confirming this date for the race.

To Oppose the Grim Law.

Members of the Automobile Club of New Jersey went to Philadelphia on Wednesday to confer with members of the club there on a campaign in opposition to the odious Grim bill introduced in the Pennsylvania Legislature.

Boston Show Closes After Six Days of Impressive Success.

Boston, Mass., March 23.—The automobile show in Symphony Hall here closed Saturday night after a remarkably successful and satisfying run of one week. Both promoters and exhibitors, and these were identical, because the show was conducted by the Dealers' Association, had nothing of which to complain.

The committee in charge of the show found that they were "on velvet" before the doors were opened. There was a good deal of "paper" out for the opening night, but on the second day there were 1,000 paid admissions, and this rate of attendance was not only sustained, but bettered as the week wore on. It is probable that a net profit of more than $2,000 was made by the show.

As for the exhibitors, they are more than satisfied; they are happy. A brisk business was done all the week, and not only were there many sales made, but the local interest in automobiling was aroused as it never has been before, and there is promise of much greater business to follow as the result of the show than that which was done at the Hall.

There were about forty demonstration vehicles working outside the hall during the whole week of the show, and so great was the demand on these that it was difficult at any time to book an engagement for a demonstration. A clever exhibition was given one afternoon by one of the Cadillac machines, for which W. E. Eldridge is agent. The operator in the car backed it over the curbstone and up on the steps of the Hall; then he set the brakes and held it there, to show how efficient was the brake power. It was an experiment on the part of the operator, but it succeeded and proved to be an impressive demonstration of reliability.

A couple of social features did much to enliven the week. On Wednesday the committee, represented by Harry Fosdick, the ever affable agent for the Winton cars, made up a party of about twenty representatives of the press and took them in three big cars out to luncheon at Auburndale. It was a jolly excursion every way. On Friday night there was a dinner to the trade at the Lenox Hotel, arranged by the committee, and this, too, was a delightful occasion.

The whole trade here is now in high feather; business is booming, and the prospect a glowing one.

DEMONSTRATION CARS OUTSIDE THE BOSTON SHOW BUILDING.

Digitized by Google

Washington Show Opens; Fewer Exhibitors but More Cars.

Washington, D. C., March 23.—The third annual automobile show given under the auspices of the Washington Automobile Dealers' Association opened to-night in the armory of the Washington Light Infantry. There was a steady downpour of rain throughout the day and the outlook was anything but pleasant, but late in the afternoon the sun dissipated the clouds and the evening was all that could be desired from a weather standpoint.

Promptly at eight o'clock the doors of the armory were thrown open, and soon the exhibition was comfortably filled with a representative Washington crowd, embracing various members of the diplomatic corps, members of Congress, army and navy officers, high officials in the Government, prominent business and professional men and habitues of the fashionable world in general. More than ordinary interest was manifested in the various exhibits and many sales will undoubtedly be consummated during the week.

This year's exhibition is far ahead of anything ever held previously in the Capitol City, both in quantity and quality of exhibits. While there are not as many individual exhibitors as there were at last year's show, there are many more different makes of cars shown. Where a dealer showed one make last year, at the present exhibition he is showing from three to five different brands.

It was originally planned to have Col. A. A. Pope open the show with an address on the subject of automobile manufacture in the United States, but the Colonel was unable to reach Washington in time, and the management reluctantly decided to open the show without any ceremonies. It is understood that Col. Pope will be here later in the week and will probably make a short address.

The armory is located on Fifteenth street just off Pennsylpania avenue, and a huge electric sign bearing the magic words "Automobile Show" jutting out into Fifteenth street directs the way of the seeker after automobile information. Entering, the visitors passes through a passageway decorated in white and hung with smilax. The effect is very pretty and serves to give the visitor an idea of what is to follow. The exhibition hall is tastefully decorated, huge electric signs and a myriad of electric lights making the effect an impressive one.

Nearly all the spaces of the exhibitors are divided one from another by neat railings. Palms and potted plants were tastefully arranged in most of the stands, and these dashes of green harmonized very nicely with the general decorative effect.

As usual, some of the exhibits were in a state of incompleteness when the show opened, due to the fact that they were delayed in transit. It seems this bad feature can never be overcome, no matter how hard the management strives to get everything in shape for the opening.

The officers of the Dealers' Association, which is promoting the show, are as follows: W. J. Foss, treasurer; S. S. Olds, Jr., secretary; B. C. Washington, Jr., general manager. All these gentlemen have been tireless in their endeavors to make the affair a success. From all appearances at this writing their efforts have borne good fruit. Good weather during the week will have much to do with the show's success, for your society people will not come out when the weather is unpropitious.

Haley's Orchestra furnishes the music, and this is a feature that is always pleasing. Another attraction is a squad of young soldiers from the Northwestern Military Academy, Highland Park, Ill., under the direction of Major Davidson, the hero of many cross-country runs, both with bicycles and automobiles. They have with them a steam automobile of 10 horse power, equipped with a Colt automatic rapid fire gun, which fires 480 shots per minute. They have established a little camp at one end of the hall and give a practical illustration of how soldiers live on a forced march. During the week the squad will give a number of drills with their automobile battery.

Each exhibitor has a number of demonstration cars at the door of the hall and prospective buyers are given a flyer around the White House ellipse.

The exhibitors are as follows:

American Cycle Mfg. Co., Washington branch.—Three Toledo gasolene tonneaus, one Waverly Stanhope, one Waverly Chelsea, one Waverly tonneau, one Waverly runabout, one Elmore tonneau, one Elmore runabout, one Cadillac tonneau, one Cadillac runabout, one Columbia motor cycle, and Elmore motor in operation.

National Motor Car Co., Washington, D. C.—One Thomas tonneau, and automobile wheel with electric motor inclosed in wheel, the product of the Direct Traction Co.

C. S. Kessler & Bro., Washington, D. C.—

IN CENTRAL PARK ON A MARCH AFTERNOON.

Digitized by Google

Diamond tires, horns, pumps and other sundries.

Howard A. Rhine & Co., Washington, D. C.—One Merkel motor cycle.

Automobile Storage & Repair Co. and National Electric Supply Co., Washington, D. C.—Rushmore searchlights, New York Belting and Packing Co.'s tires, batteries, etc.

Cook & Owesney, Washington, D. C., and Chas. E. Miller & Bro., Washington, D. C.—One Darracq tonneau, one Reading steam touring car, one Grout Model E, one Grout Model J, one Clement cycle motor.

Automobile Co. of Washington.—One Rambler chassis, one Locomobile trap, one Rambler touring car, one Conrad tonneau.

Walker & Hazeltine, Washington, D. C.—Fisk automobile tires.

The Week's Incorporations.

New York, N. Y.—Packard Motor Car Co., with $10,000 capital. Directors—G. T. McLaughlin, F. D. Peale and K. Connelly.

Chicago, Ill.—Automobile Engineering & Power Co., with $100,000 capital.

New York, N. Y.—Auto Machine & Repair Co., with $10,000 capital. Directors—Benjamin R. Tubbs, Henry W. Tubbs, of Kingston, and D. L. Creveling, of Wilkesbarre.

Conquering the Local "Terror" in Syracuse.

In Syracuse, what is known as the East Adams street hill is one to which the natives point as the local "terror." It is that steep that when an automobile mounts it without faltering the car is at once voted "a good one." Realizing the fact, the Century Motor Vehicle Co. uses the hill as a testing ground, each of its cars, before being shipped, being required to make the ascent, not once, but many times. The illustration shows one of the Century Tourists negotiating the grade, which averages 18½ per cent and is 22½ per cent at the summit. The Century people claim that theirs is the only single cylinder car that has climbed the hill from five to ten times in succession and without stopping the motor.

Baltimore, Md.—One Winton touring car, one Stevens-Duryea carriage, one general tonneau.

National Capitol Automobile Co., Washington, D. C.—One Peerless chassis, one Autocar chassis, one Oldsmobile runabout, one Stevens-Duryea carriage, one General model Oldsmobile.

Washington Electric Vehicle and Transportation Co.—One 2½-ton Columbia truck, one Columbia victoria, one Columbia runabout, one Columbia tonneau, one Columbia gasolene tonneau.

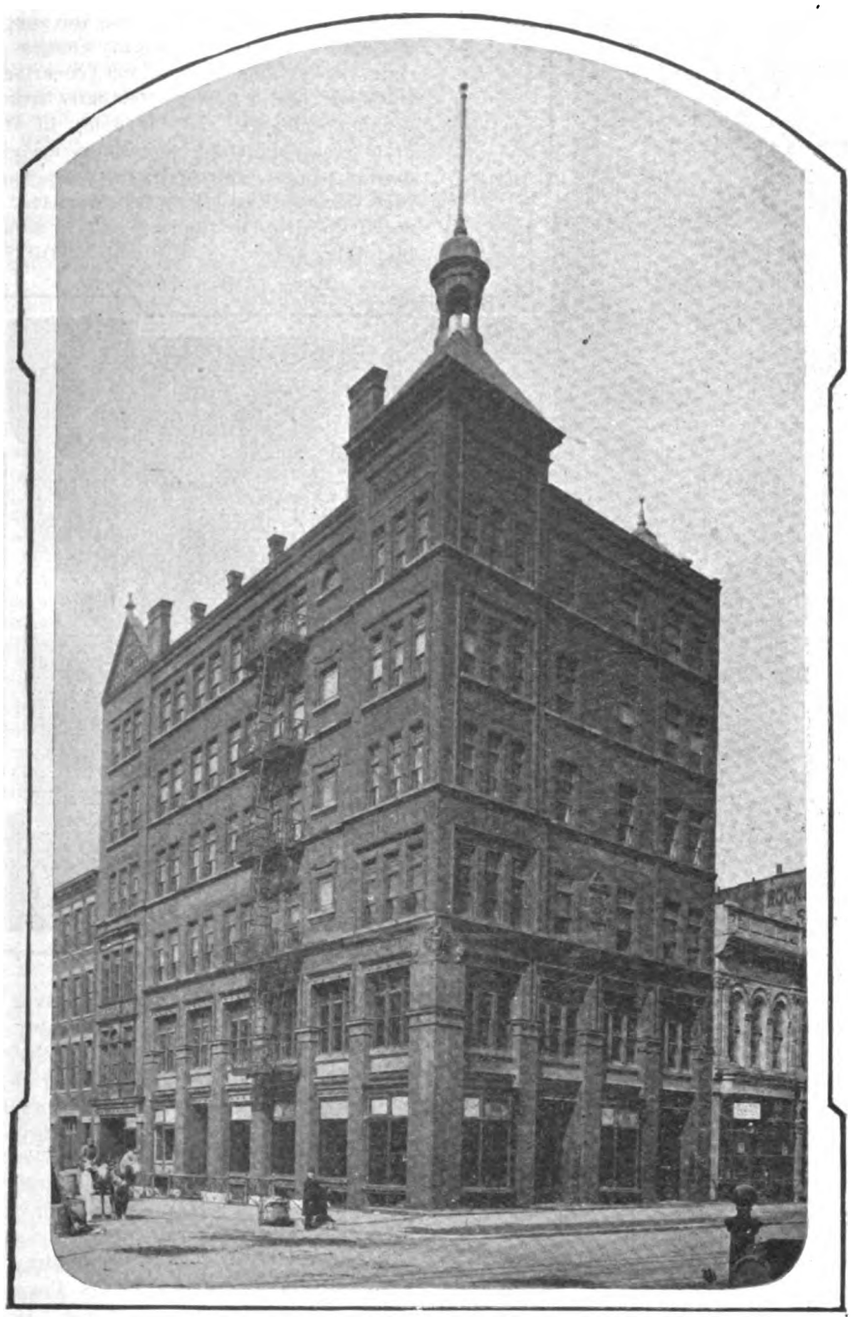
Tennant Automobile Tire Co., Springfield, O.—Automobile tires.

20th Century Mfg. Co., New York.—20th Century automobile lamps.

Schaum Automobile and Motor Mfg. Co., Baltimore, Md.—Champion accumulators and Schaum improved spark plugs.

Washington Motor Car Co.—Northern, Knox and Orient buckboard. Exhibit delayed.

United States Long Distance Automobile Co., Washington branch—Three U. S. Long Distance tonneaus.



The Demand for Darracqs.

It will surprise many to learn that three-fourths of all the cars imported into this country during 1902 are asserted to have been brought over by one concern, the American Darracq Automobile Co., of this city. However surprising it may prove, Manager F. A. La Roche of the Darracq company maintains the correctness of the assertion, and, what is more, states that that record will be surpassed during the current year. He naturally is well pleased with his share of the business and reports brisk sales.

The Metropolitan Salesrooms and Garages—III

What is probably the largest storage, sales and repair station in the metropolis is almost the latest one established. This is the new place of the Mobile Co. of America, at No. 1,713 Broadway, on the corner of Fifty-fourth street.

MOBILE CO. OF AMERICA, No. 1713 BROADWAY.

This is a handsome brick building, six stories in height above a basement. It has a frontage of 60 feet in Broadway and of 84 feet in Fifty-fourth street. Inside there is a total of 35,000 square feet of floor room, giving a capacity for fully 200 motor vehicles.

The interior is in keeping with the exterior of brick, with brownstone trimmings. Formerly the building was occupied by a carriage concern, and many of the floor arrangements made by them were found ideal for the purposes of an automobile garage. This is particularly noticeable on the top floor, where the machine shop is located. The front end of the floor has been partitioned off into perfectly equipped painting and drying and wood working rooms, and these apartments have been retained for these purposes. There is also a washing table on this floor. The machine shop is equipped with an assortment of lathes, milling and other machines, and, being lighted through a skylight as well as through two rows of windows, there is every opportunity for excellent work being done. A stock room filled with parts for Mobiles and every other sort of machine is another feature of this floor.

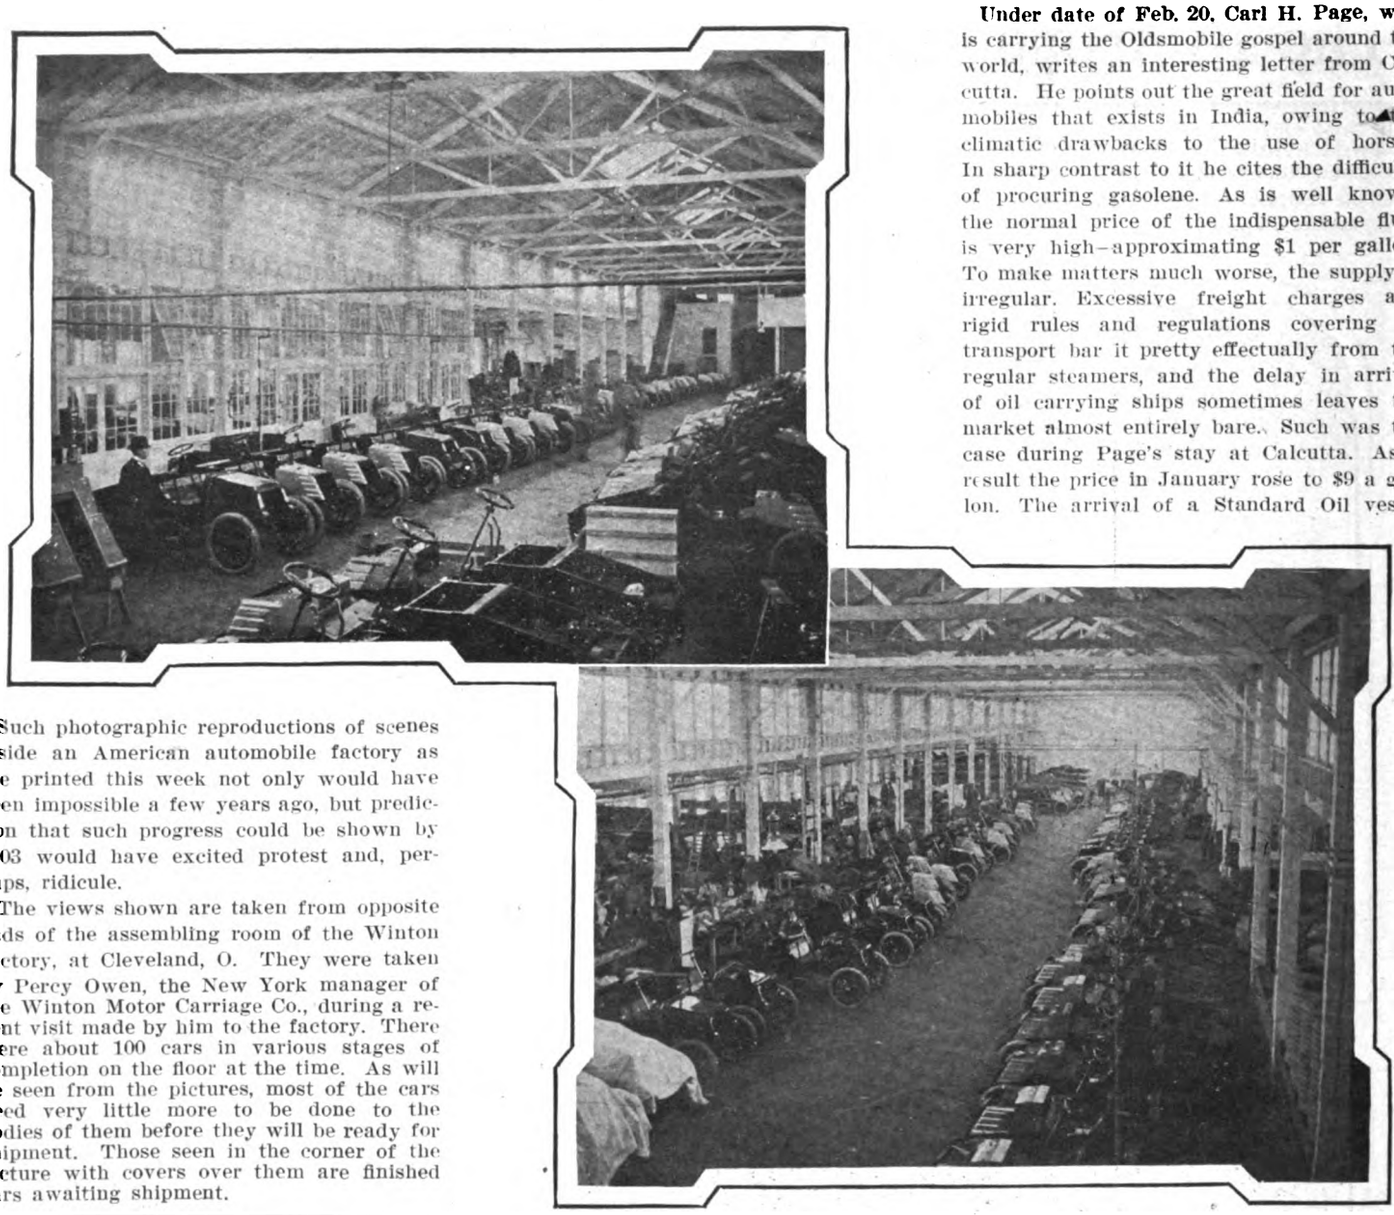
All the power in the building is electrical. An elevator 15 by 7 feet, and capable of hoisting 5,000 pounds, runs from the cellar to the top floor. A wide doorway on the Fifty-fourth street side permits of a car of the largest size made being driven from the street directly on to the elevator.

The ground floor is the salesroom, although some storage machines also are kept there, Robert C. Fulton, E. R. Thomas and the Marquis Jean Mazzacorati being already numbered among the customers of this new place, which was opened on February 15. A waiting room for patrons, offices for Superintendent A. S. Robinson and lockers for customers are also fixtures of the main floor.

In the basement there is a washing table 23 by 27 feet, that has been put in by the Mobile company, and here also cars are stored.

On the second floor are the offices of the manager, E. B. Gallaher, the result of whose ideas are seen and whose personality is felt throughout the building. The offices occupy this entire floor, and from them the whole sales business of the Mobile company is managed.

The third is the electrical floor, and here is found the expression of one of Mr. Gallaher's ideas in the way of a charging board that is remarkably efficient, convenient and economical. It is a compound board, with which a dozen cars can be connected for charging at one time, and by simply pressing certain buttons a reading can be made of any one of the cars being charged, the quantity of "juice" it has received determined, and, if desired, it can then be cut off without in any way interfering with the charging of the other cars.



On each floor there is a locker room for the convenience of customers, and on the fourth floor is a comfortably appointed room for chauffeurs. The fifth floor is for storage and has no especial features.

One rule of this elaborate establishment that was made by Manager Galleher is that every car when it comes in is thoroughly gone over by an expert and a report made on its condition, so that if any repairs are needed a report can be made to the owner.

The spaciousness of this repository, the completeness of its equipment and its proximity to Central Park all mark it for a place to be favored by automobile owners.

Two Views of the Winton Assembling Room.

Such photographic reproductions of scenes inside an American automobile factory as are printed this week not only would have been impossible a few years ago, but prediction that such progress could be shown by 1903 would have excited protest and, perhaps, ridicule.

The views shown are taken from opposite ends of the assembling room of the Winton factory, at Cleveland, O. They were taken by Percy Owen, the New York manager of the Winton Motor Carriage Co., during a recent visit made by him to the factory. There were about 100 cars in various stages of completion on the floor at the time. As will be seen from the pictures, most of the cars need very little more to be done to the bodies of them before they will be ready for shipment. Those seen in the corner of the picture with covers over them are finished cars awaiting shipment.

From Olds's Foreign Missionary.

Under date of Feb. 20, Carl H. Page, who is carrying the Oldsmobile gospel around the world, writes an interesting letter from Calcutta. He points out the great field for automobiles that exists in India, owing to the climatic drawbacks to the use of horses. In sharp contrast to it he cites the difficulty of procuring gasolene. As is well known, the normal price of the indispensable fluid is very high—approximating $1 per gallon. To make matters much worse, the supply is irregular. Excessive freight charges and rigid rules and regulations covering its transport bar it pretty effectually from the regular steamers, and the delay in arrival of oil carrying ships sometimes leaves the market almost entirely bare. Such was the case during Page's stay at Calcutta. As a result the price in January rose to $9 a gallon. The arrival of a Standard Oil vessel relieved the situation. The natives look upon the automobile as an unearthly thing and believe it has a god inside. The white residents, however, take to it with enthusiasm. The heat makes the use of horses well nigh impossible and creates a promising field for power-driven vehicles. There are now not more than twenty-five automobiles in India, but Page says his sales have been large and that there is a demand for all that can be sent. There have been thirty Oldsmobiles sent to various points Page is to visit.

Compound Motors Coming Through.

The Graham-Fox Co. is now well settled in its new quarters at 542 W. Broadway, New York, and work is progressing at a rate that ensures the speedy appearance of cars equipped with the company's compound gasolene motor, the sensational performance of which a few months ago will be recalled.

A force of draughtsmen is at work finishing the drawings for the various cars, motors, etc., the company is preparing to market. These include a 100 horsepower racing car built to the special order of a customer, and a 24 horsepower tonneau touring car, which is the first of the regular models to be produced.

The latter is a car of thoroughly modern design, with extremely graceful lines. The regulation Graham-Fox compound gasolene vertical motor, placed in front under a bonnet, supplies the motive power. The latter is transmitted by means of sliding gears and counter shafts direct to the rear wheels by individual chains. The motor, which was described in these columns some months ago, is retained unchanged in principle, the two regular cylinders exhausting into a third and increasing the efficiency to a remarkable extent. Some detailed changes have been made, the most important being the fitting of mechanical intake valves.

To a Motor World man last week Mr. Fox stated that work on both the tonneau and the racing car was well under way. He thought that by May 15 they would have the first batch of tonneau cars ready, and would in the mean time be pushing along on the other models. There was a vast deal to do, he said, but remarkable progress was being made, and with all the capital they needed available they would even this year be able to turn out a very respectable number of cars.

Brandes Bringing Over two New Cars.

A racing Cudell car is being imported by J. C. Brandes, the representative in this country of the German concern of that name. A Pipe car, a Belgian production, which was awarded a gold medal at the last Paris exhibition, is also on the way to form an addition to the Brandes stock.

NEW JERSEY BILL PASSES.

(Continued from page 983.)

and uniform rules regulating the use and speed thereof.

1. Wherever the term "motor vehicle" is used in this act it shall be construed to include automobiles, locomobiles and all other vehicles propelled otherwise than by muscular power, excepting the cars of electric and steam railways and other motor vehicles running only upon rails or tracks; but nothing in this act contained shall be construed to apply to or affect bicycles, tricycles or such other vehicles as are propelled exclusively by muscular pedal power.

2. Every resident of this State who is the owner of a motor vehicle, and every non-resident owner whose motor vehicle shall be driven in this State, shall file in the office of the Secretary of State a declaration duly verified that such owner is competent to drive the motor vehicle for which application for license is made, and a written statement containing the name and address of such owner, together with a brief description of the character of such motor vehicle, including the name of the maker and the manufacturer's number of the motor vehicle, if number there be, and the rated horsepower of the motor vehicle, and shall pay to the Secretary of State a registration fee of one dollar for each motor vehicle; the Secretary of State shall issue for each motor vehicle so registered a certificate, properly numbered, stating that such motor vehicle is registered in accordance with this section, and shall cause the name of such owner, with his address, the number of his certificate, and a description of such motor vehicle or motor vehicles, to be entered in alphabetical order of the owners' names in a book to be kept for such purpose; this section shall not apply to manufacturers or dealers in this State of motor vehicles except as to vehicles kept by such manufacturer or such dealer for private use or for hire.

Penalty: For driving a motor vehicle without a license: First offence, $50; second offence, $100. (Sec. 17.)

3. The owner of each and every motor vehicle driving the same upon the public streets, public roads, turnpikes, parks, public parkways, public driveways or other public highways in this State shall have the number of the license issued as aforesaid by the Secretary of State upon the back of every such motor vehicle, in a conspicuous place, so as to be plainly visible at all times during daylight, such numbers to be separate Arabic numerals, not less than three inches in height, the strokes to be of a width not less than three-eighths of an inch, and, excepting the numbers upon the lamps, as required by section four of this act, such owner shall not be required to place any other marks of identity upon said motor vehicle.

Penalty: For driving a motor vehicle without a number, $15. (Sec. 17.) For using fictitious number, $100. (Sec. 8.)

4. Every motor vehicle shall carry, during the period from one hour after sunset to one hour before sunrise, at least two lighted lamps, showing white lights, visible at least two hundred feet in the direction toward which such motor vehicle is proceeding, and shall also exhibit at least one red light visible in the reverse direction; upon the sides or fronts of the two aforesaid lamps showing white lights shall be displayed in such manner as to be plainly visible when said lamps are lighted the number of the license issued as aforesaid by the Secretary of State, the same to be in separate Arabic numerals, not less than one inch in height; every motor vehicle shall also be provided with good and efficient brake or brakes, and shall also be provided with suitable bell, horn or other signal device.

Penalty: $10. (Sec. 17.)

5. The following rates of speed may be maintained, but shall not be exceeded, upon any public street, public road, or turnpike, public park or parkway, or public driveway, or public highway in this State by any one driving a motor vehicle:

(1) A speed of one mile in six minutes upon the sharp curves of a street or highway and at the intersection of prominent cross roads where such street, road or highway passes through the open country, meaning thereby portions of a town, township, borough or village where houses are more than one hundred feet apart.

(2) A speed of one mile in seven minutes where such street or highway passes through the built-up portion of a city, town, township, borough or village where the houses are and average less than one hundred feet apart.

(3) Elsewhere and except as otherwise provided in subdivisions one and two of this section a speed of one mile in three minutes.

Provided, however, that nothing in this section contained shall permit any person to drive a motor vehicle at any speed greater than is reasonable, having regard to the traffic and use of highways, or so as to endanger the life or limb or to injure the property of any person; and it is further provided that nothing in this section contained shall affect the right of any person injured either in his person or property by the negligent operation of a motor vehicle to sue and recover damages as heretofore.

Penalty: (1) $25; (2) $25; (3) First offence, $50; second offence, $100, or in the discretion of the Magistrate, ten days' imprisonment. (Sec. 17.)

6. Every person driving a motor vehicle shall, at request or upon signal by putting up the hand or otherwise from a person riding or driving a horse or horses in the opposite direction, cause the motor vehicle to stop and remain stationary so long as may be necessary to allow said horse or horses to pass.

Penalty: $10. (Sec. 17.)

7. No owner of a motor vehicle who shall have obtained a certificate from the Secretary of State as hereinbefore provided shall be required to obtain any other license or permit to use or operate the same, nor shall such owner be excluded or prohibited from or limited in the free use thereof, nor limited as to speed upon any public street, avenue, road, turnpike, driveway, parkway, or other public place, at any time, when the same is or may hereafter be opened to the use of persons having or using other pleasure carriages, nor be required to comply with other provisions or conditions as to the use of said motor vehicle, except as in this act provided; provided, however, that nothing in this section contained shall be construed to apply to or include any speedway created and maintained in pursuance of an act of the legislature of the State of New Jersey, entitled "An act to provide for the construction and maintenance of speedways in the counties of this State," approved March nineteenth, one thousand nine hundred and two; nor to any parks or parkways created and maintained in accordance with an act of the legislature of the State of New Jersey, entitled "An act to establish public parks in counties of this State and to provide for the acquirement, improvement and regulation of the same," approved March twentieth, one thousand nine hundred and one.

No city, town, township, borough or other ordinance, by-law or resolution limiting or restricting the use or speed of motor vehicles, and no ordinance, by-law or resolution heretofore or hereafter made by any municipality shall have power to make any city, town, township, borough or other municipal or local authority by whatever name known or designated in respect to or limiting the use or speed of motor vehicles shall have any force, effect or validity.

8. Any person driving a motor vehicle the owner of which shall not have complied with the provisions of this act, and which motor vehicle shall display a fictitious number, the same being a number other than that designated for such motor vehicle by the Secretary of State, shall, upon conviction, be fined in a sum not exceeding one hundred dollars, and, in default of payment thereof, be punished by imprisonment in the county jail for a period not exceeding thirty days; provided, this section shall not be construed to prohibit a motor vehicle displaying the proper number of its license from also displaying any other number for any lawful purpose.

9. Any person driving a motor vehicle upon any public streets, public highways, public roads, turnpikes, parks, public parkways or public driveways in this State in a race or on a bet or wager shall, upon conviction, be fined in a sum not exceeding fifty dollars, and, in default of payment thereof, be punished by imprisonment in the county jail for a period not exceeding twenty days.

10. Upon oath or affirmation made acccrding to law that any person has violated any of the provisions of this act, any magistrate of the county where such offence is committed may, within three months after the commission of such offence, issue process in the nature of a summons or warrant, in his discretion, at the suit of any person, to the use of the overseer of the poor of the city, town, township or borough where such offence is committed, against the person so charged, which process shall, when in the nature of a warrant, be returnable forthwith, and when in the nature of a summons, in not less than three nor more than ten days; such process shall state what section or provision of this act is alleged to have been violated by the defendant, and the time and place of such violation, and on the return of such process, or at any time to which the trial may be adjourned, the magistrate before whom said complaint shall be made shall proceed to hear the testimony and to determine and give judgment in the matter without the filing of any pleading; if the magistrate before whom such trial is had shall find the defendant guilty, he shall give judgment for the penalty mentioned in the section or provision herein violated, and such costs as are allowed in the justice's court in like proceedings for collection of penalties; in default of the payment of the judgment and costs, the defendant so convicted may be sentenced to the county jail for such period as is provided for in this act.

11. Any constable or police officer is hereby authorized to arrest, without warrant, any person driving a motor vehicle contrary to the ninth section of this act, and to bring the person so offending before any magistrate of the county where such offence is committed; the person so offending shall be detained in the office of such magistrate until the officer making such arrest shall make oath or affirmation, which he shall do forthwith, as provided in section ten of this act, whereupon such magistrate shall issue a warrant returnable forthwith; the said magistrate shall proceed to hear and determine said complaint and give judgment or adjourn the hearing of said complaint, as

Digitized by Google

provided by sections ten and twelve of this act.

12. The magistrate before whom a complaint is made shall adjourn the hearing of said complaint for a time not less than three days and not exceeding ten days, if the defendant shall so request, and shall deposit the sum of fifty dollars as security to appear at the date to which such hearing may be adjuorned, and if the said defendant does not appear at the time mentioned, then the said sum deposited shall be forfeited, and the balance thereof, after payment of the costs, shall be paid to the overseer of the poor for the use of the poor of the city, town, township or borough where the offence is committed.

13. If a person violating any of the provisions of this act shall be or reside in any other county of this State than that in which said warrant shall be issued, the magistrate issuing the same shall, in writing, thereupon direct that the sum of fifty dollars be deposited as security by any party so charged, and it shall be the duty of the party serving the same to carry it to some magistrate of the county wherein such person resides or can be found; the magistrate to whom the same shall be presented, on proof being made to him of the handwriting of the magistrate who issued such warrant, shall indorse his name thereon with an authority to arrest such person in the county where the magistrate so indorsing resides, which shall be sufficient authority to execute such warrant in the county where it shall be indorsed.

14. The party so charged being apprehended shall be taken before the magistrate who indorsed said warrant, or some other magistrate of the same county who may, and, if tendered, shall take from such person a deposit of fifty dollars in cash to secure the appearance for trial of said defendant before the magistrate who issued said warrant, and thereupon the person so apprehended shall be released from the custody of the officer arresting him; the date of said trial shall be fixed by the magistrate accepting said deposit, and the sum so received by him shall be turned over to the magistrate issuing the warrant, to be retained and disposed of as provided in section twelve of this act in default of the appearance of the person so charged.

15. Any party to any proceeding instituted under this act may appeal from the judgment or sentence of the magistrate to the Court of Common Pleas of the county in which the said proceedings shall take place; provided, that the party appealing shall, within fifteen days after the date of said judgment, file a written notice of appeal, pay the costs of such proceedings and deliver to the magistrate a bond to the overseer of the poor of the city, ward, town, township or borough in double the amount of the judgment and costs, with at least one sufficient surety, conditioned to prosecute the said appeal and to stand to and abide by such order or judgment as may thereafter be made against said party; a commitment, however, may issue at any time before the taking of an appeal for the imprisonment of the defendant unless security be given as provided in section eighteen of this act, which said commitment shall be vacated either by appeal or by the payment of the judgment and costs.

16. Whenever an appeal shall be taken as aforesaid, it shall be the duty of the magistrate to send all papers and money, if any deposited, pursuant to the provisions of this act, together with a transcript of the proceedings in the case, to the next Court of Common Pleas of the said county, which court shall try and determine all such appeals in the same way and manner that appeals from the courts for the trial of small causes are now tried and determined.

17. Any person violating the provisions of this act shall, except as otherwise provided herein, upon conviction, be fined in a sum not exceeding the amounts hereinafter set forth: for a violation of section two, fifty dollars; for a violation of section three, fifteen dollars; for a violation of section four, ten dllars; for a violation of section five, subdivision one, twenty-five dollars; for a violation of section five, subdivision two, twenty-five dollars; for a violation of section five, subdivision three, fifty dollars; for a violation of section six, ten dollars; in default in the payment of any such fine there shall be imposed an imprisonment in the county jail for a period not exceeding ten days; provided, that any offender who shall have been found guilty of a violation of this act and sentenced therefor, and who shall be convicted of a second offence of the same violation, may for such second offence be fined in double the amount herein prescribed for the first offence, and may, in default of the payment thereof, be punished by imprisonment in the county jail for a period not exceeding ten days; and further provided, that any offender who shall have been found guilty of a violation of section five, subdivision three, thereof and sentenced therefor, and who shall be convicted of a second violation of the same section and subdivision, may, in the discretion of the magistrate, instead of being fined as prescribed, be punished by imprisonment in the county jail for a period not exceeding ten days.

18. Every fine shall be payable forthwith, or, in default of such payment the magistrate may accept a bond to the overseer of the poor of the township, borough, ward or city in double the amount of the judgment and costs, with at least one sufficient surety, conditioned to pay the said judgment within a period thereafter to be fixed by said magistrate, not exceeding ten days, or in lieu of such bond the magistrate may retain possession and hold the motor vehicle as security for such payment.

19. All penalties collected from persons offending against the provisions of this act shall be paid by the magistrate receiving the same to the overseer of the poor of the city, ward, town, township or borough where the offence is committed, for the use of the poor in their respective districts.

20. The word "magistrate" used in this act shall be deemed and understood to mean and include all justices of the peace, judges of city criminal courts, police justices, recorders, mayors and all other officers having the power of a committing magistrate.

21. All acts and parts of acts inconsistent herewith are hereby repealed.

22. This act shall take effect immediately.

DECLARATION.

The undersigned does hereby declare, pursuant to the provisions of an act of the legislature of New Jersey, entitled "An Act defining motor vehicles and providing for the registration of the same, and uniform rules regarding the use and speed thereof," that he is the owner of and competent to drive the motor vehicle for which application for license is hereby made as set forth in the annexed statement.

Name of Owner.....
Residence Address.....

State of.....
County of .....
ss.:

....., being duly sworn, says that the statement of facts contained in the foregoing declaration is true,

Subscribed and sworn to before me this.....day of....., 1903.

STATEMENT.

The name and address of the undersigned owner are as follows:

Name .....
Address .....
The character of the motor vehicle is a.....
The maker is.....
The maker's number is.....
The rated horsepower is.....

Annexed hereto is the statutory declaration.

.....
Owner.

Note.—The declaration and statement should be sent to Hon. S. D. Dickinson, Secretary of State, Trenton, N. J., with a filing fee of $1.

Omitted One of the Powers.

Editor The Motor World:

In your issue of March 5 I notice that a Mr. Fisher presents what was intended to be taken as the comparison of cost, repairs, trouble and general efficiency of three powers for automobiles, namely, steam, gasolene and electricity, and as he has omitted the White system the writer does not think the report complete, and will not serve the purpose for which he no doubt intended it, namely, to enlighten the public as to which machine to buy.

The writer has had experience with gasolene cars, having crossed the Rocky Mountains in a well known gasolene touring car of 15 h. p. and having been over the same road in a 6 h. p. White car. I believe if Mr. Fisher had been along on these two trips he would make some change in his figures. The results obtained by the writer with the gasolene car and the White car are about on a par with the results shown by the Automobile Club of America in their several endurance runs. In the 100-mile non-stop endurance run of May 30 last a record was kept by the A. C. A. of fuel consumption of 31 gasolene cars entered. Seventeen went through without a stop with an average fuel consumption of 6 3-17 gallons per machine for the 100 mile run. Three Whites were entered and came through without a stop, the average fuel consumption for each machine for the 100 miles being 6 93-100 gallons. The total time consumed for repairs for the 31 gasolene cars was 585 minutes. There was no time consumed for repairs on the White. In the last New York-Boston and return 500 mile endurance run there were 56 gasolene cars entered. These cars had a total of 202 involuntary stops due to disorder of their mechanism, and consumed in all of these stops 3,989 minutes. Four White cars were entered, two being delivery wagons, with one involuntary stop for the four; time consumed, four minutes; the car making the stop being a delivery wagon. These are a few figures taken from the official record, which can be obtained from the Automobile Club of America. Four White cars entered in the New York-Buffalo run made even better showing than the above in comparison with the gasolene cars.

Mr. Fisher's average of one minute for starting a gasolene car, in the writer's experience, is an uncertain quantity, whereas with the White car it is not necessary to exceed five minutes starting from a cold machine.—W. J., Denver, Col.

IMPORTANCE OF INSPECTION

Little Lapses at the Factory That Caused the Dealer Worry and Expense

"There is one trouble noticeable in nearly all new business that is noticeable in the automobile industry just now; or at least it is worrying the retail portion of it," said a well known metropolitan tradesman last week to The Motor World man, who looked sympathetic and nodded encouragingly.

"I refer to the lack of proper inspection. There is a screw loose somewhere. Things that should not escape the competent and conscious inspector are not detected and the cars leave the factory in a condition that guarantees trouble for some one. If the dealer looks after things properly—as he should do for selfish reasons if nothing else—he may discover and rectify these mistakes; but he is not infallible, and sometimes they will get past him; besides, it is not fair that he should be compelled to put in so much time at his own cost.

"Now, take my own case," he went on. "Here is a car that I am making a strong push on"—indicating a well known gasoline car that sells at a popular price. "It is a fine car—one that is well made, strong and durable, with plenty of power and speed; in short, an ideal car of its kind. It is a splendid seller, and I am putting them out just as fast as I can get them in carload lots. Good proposition, isn't it? Well, there's a fly in the ointment, as usual. This particular fly is the lack of competent inspection.

"There are lots of little things that are not quite right. We take them out of the car and put them together and then proceed to go over them to see if they are all right. At first we thought we could do this in a few hours; but we have changed our minds.

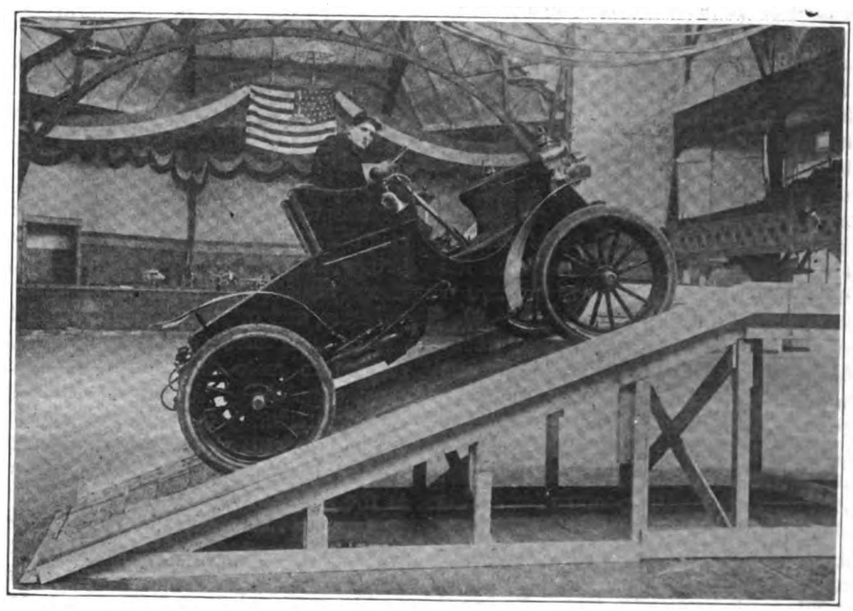
"One of our first sales was to a man down on Long Island. He took the car and started to drive it home; got about half way there and it stuck, leaving him 'steen miles from anywhere. He tried to fix it, after locating the trouble in the carburetter, but had to give it up ac a bad job. He put the car in a barn and went home by train, raging inwardly—outwardly, too, maybe. Came post haste here next day and raised Cain. Wanted a new car or his money back. The easiest way out of it was to comply with his demand; and we gave him a new car, but not until I was dead certain that it was all right, although it took us several days to become convinced of this fact. It worked like a charm, and since then the man has been one of our best customers. Has brought or sent in half a dozen friends, two of whom have bought cars like his.

"We had two or three cases of this kind. One of them occurred only the other day, and when we had begun to think that we had things dead to rights. Sold the car to a man over Tuxedo way and shipped it to him. The first ride he took he had an experience similar to the Long Island man's. We did not have to give him a new car, however. But it cost us quite a few dollars to straighten the thing out. First we sent a man out to fix the car. He worked on it all day, and then came back and recommended that we get it back and fix it right. This we did, and have not heard from it since.

"We are putting from one to five day's work on each of these cars, and it's pretty expensive, to say nothing of the time it takes.

"What are the chief troubles? Well, that is hard to say. There is never much wrong. If there was we might feel tempted to give the car up as no good. But it is good—the best car you could wish for after it's put to rights. The parts are well made and the assembling appears to be all right. But there is a lack of something. Perhaps it is the absence of a brainy chief inspector—a man who goes over everything, looking for infinitesimal faults or shortcomings, and who will not be satisfied with anything but the very highest grade of work. It is the touch of a master hand that is wanted, and while every factory can hardly be expected to have such superlative workmen it would pay them to do so. Certainly the satisfaction to the purchaser would be sufficient recompense for the trouble and expense incurred.

"What are we going to do about it? I hardly know. I have just written a long letter to the factory, relating some of our experiences, and putting the case before them in the fullest and most explicit manner. What effect it will have I can't say.



"But one thing is certain: Either they must do the inspecting or we shall. The instinct of self preservation compels us to this course. One dissatisfied customer can do more to hurt us, hurt the maker and hurt the automobile industry generally than any other thing. And when you multiply the number there is going to be danger of giving the business a black eye from which it will take a long time to recover.

"Of course, I appreciate the fact that early in the season an unusual amount of trouble is to be looked for. And I will admit that there is some improvement noticeable each week. But there is room for a great deal of improvement, and valuable time is being lost. After all, it comes down to this: Are makers going to be satisfied with a 'good enough' policy, or are they going to strive for perfection—or as near it as poor human nature can come?"

To Welcome the New White.

Hope deferred has only sharpened the desire felt by the White Sewing Machine Co.'s forces in this city for the new touring car. The salesroom in Union Square has been made ready for it. New wall and floor coverings—the latter a particularly rich and handsome carpet—impart an air of expectancy, and the entire front of the establishment has been made ready for the new car. When The Motor World man stopped in last week he was informed that the waiting period was about at an end, for a touring car had just been received at the garage and was being made ready for Manager Denning to give it a trial run. The car presented an imposing appearance, its fine finish being especially noticeable. A few detail changes have been made since the car was seen at Madison Square Garden. Among them may be mentioned the finishing of the engine, pipes, etc., under the bonnet, which is now covered with aluminum paint, the water regulator, etc.

Proving Its Hill Climbing Capacity.

WHY THE PNEUMATIC

Figures From Paris to Prove the Air Tire More Durable Than the Solid.

"There are two good reasons why the Parisian cab owners have adopted pneumatic tires—(1)they last longer, and (2) they are more sought after by the clients. It may be difficult to convince some American readers that pneumatic tires outlast the solid, but the best proof of this statement is their general adoption by cab owners. A set of four pneumatic tires will last (with ordinary care) thirteen months for the front wheels and fifteen for rear wheels. When the tires are on cabs of a co-operative company they will last fifteen months on the front wheels anad eighteen on the rear wheels. A tire may pick up a nail once in a while, but this puncture is quickly repaired by a workman on the company's premises," says the India Rubber World.

"Prices of pneumatic tires in Paris have fallen to 400 francs ($78.20) for a set of four, including four wire wheels with steel hubs turned up to fit the stub of the axle, and the whole mounted on the cab. This same outfit two years ago sold for 750 francs ($144.75). This great reduction in price has mare pneumatice cheaper than solid tires. The cab owner does not feel the outlay, because it is the public that 'pays the freight.' There are very few owners of a single cab; most of them are owned by men who have from twenty to 100 cabs, which they rent by the day to responsible cochers. The average rental without rubber tires is about 15 francs ($2.90) per day, with the privilege of changing horses once during the day. If the cab has pneumatic tires the price is from two to three francs more, or $3.28 to $3.47 per day. Cabs with solid tires are rented to the cochers at the same rate as the steel tired wheels.

"The Parisian is now accustomed to wait until he finds a metal wheeled cab before he gets in. Nearly all pneumatic tires for cabs are mounted on wire wheels. The Parisian is evidently of the opinion that pneumatic tires on wood wheels do not give the same comfort as on metal ones. The pneumatic tired cab is always busy, and loads oftener, and the Parisian is more liberal with his pour boire than he would be if he used a steel or solid tired cab.

"It is expected that there will be about six thousand pneumatic tired cabs in Paris by the end of this year, and if the two large cab companies adopt them a cab on the streets of Paris without pneumatic tires will become as great a curiosity as was the first cab that appeared with pneumatics. This will simply be history repeating itself, for it is only a few years since great excitement was created by the appearance of the first automobile with pneumatic tires. To-day it is the automobile with solid tires that excites comment. So it will be with the fiacre. The carriage builders and owners of private carriages are also fast adopting pneumatic tires, which are put on in a neat manner by doing away with the wooden fellies; then metal sockets are slipped over that part of the spokes that were in the felly, and the pneumatic tire rim is screwed onto these sockets from the inside of the rim. This makes a neat job and a graceful one."

How Man's Freedom has Been Furthered.

"First, in the early days of the world, were the slow moving caravans of camels, picking their arduous ways along rough tracks and ungraded paths, the creaking ox cart and the laden mule or horse. Then road building and the creation of palanquins and carriages, then the post road, the roadside tavern and the note of the coach horn awakening the quiet country hamlet from its lethargy. Then the two shining rails, the steam engine and the railway train, then the overhead wires and the electric car, binding village to village. And now the automobile practical, safe, inexpensive, vaunting the railway train, outspeeding the fleetest horse! A horse can go a mile in about two minutes, or it can go forty miles in a day. An automobile can go a mile in one minute or forty, fifty, and even sixty miles in one hour, and keep up that pace hour after hour indefinitely," says the New York Observer.

"This is what the automobile means to-day. Good roads, reaching out into all parts of our land, roads which will be useful also for the farmer and the traveler, with or without his automobile. It means that the day of railroad monopoly is past and that the individual will go and come how, when and where he pleases. It means that that provincialism which stunted the growth of Greece, which has arrested national and personal development in China for three thousand years, and which is the greatest foe civilization has to fight, will be annihilated. It means that one may live in the country, yet pursue an urban occupation.

Royalty's Tire Equipment.

In view of the satisfactory behavior of the tires fitted to King Edward's Daimler cars—solid rear and pneumatic front—a similar combination has been decided upon for the Prince of Wales' car, now building. All these cars are heavy, and the freedom from puncture and other troubles secured by the use of solid tires for the rear wheels has seemed to more than offset the disadvantages entailed.

It is interesting to recall that the Electric Vehicle Co. still retains this combination for one at least of their models. This vehicle is the surry. In it so much weight is carried on the rear wheels that solid tires were originally used from necessity, and even now, although pneumatic tires have been vastly improved, it is deemed wise to make no change.

APPRECIATING THE RAILS

How New York Horses and Truckmen are Showing the Value of Steel Roadway.

An object lesson in good road value is afforded by the daily occurrences in Murray street, west of Broadway, this city. It is here that the experimental steel roadbed was laid a few months ago, consisting of two rails of about a footh in breadth and having small flanges to hold vehicle wheels in place.

The street slopes upward from the river, the block ending at Broadway being much less steep than that part further west. It is given over to loaded drays, trucks and delivery wagons, and the travel is almost entirely uphill, i. e., from the river. Consequently the pull is a sharp one, and the rate of travel slow.

The tracks are in the centre of the street. The latter is so wide that wagons backed up at either curb almost clear the tracks; but unless they are small they do not quite clear. Therefore vehicles using the tracks have to leave it frequently to get past the loading or unloading wagons. In spite of this the drivers steer for the rails, or, if they neglect to do so, many of the horses move over to it of their own volition. Consequently there is a long line of vehicles in the middle of the street, broken at intervals by the obstructing wagons, but seldom keeping away from the tracks.

A wagon on the tracks pulls very much easier than one drawn over the Belgian blocks at either side. The difference is seen whenever a change is made. On the smooth roadway the horse or horses have a comparatively easy task; on the blocks they labor perceptibly.

Both drivers and horses seem to know that the rails are there, and why, however. And if they were not blocked it is probable that the remainder of the street would not be used at all.

Features of Mercedes Road Model.

One of the leading road models of the 1903 Mercedes product is the eighteen horsepower car. It weighs 2,294 pounds without gasolene or water. The wheel base is 2,330 mm. (7 ft. 7¾ in.).

The cylinder bore is 110 mm. by 140 mm. stroke (4 1-3 in. x 5½ in.). It is fitted with four speeds, and the change is operaed by a single lever, which moves forward and backward, the lateral motion having been done away with. The normal speed of the engine is one thousand revolutions a minute. The inlet valves are mechanically operated, and have a variable lift. The contents of the honeycomb radiator are about 2½ gallons. The size of tires are 910x90 mm. (35¾ in. x 3½ in.) in front, and 920x120 mm. (36¼ in. x 4¾ in.) on the driving wheels.

In India the price of gasolene has been reduced. Motorists can now obtain it for 83 cents a gallon.

GETTING OUT THE CAR

How the Expert Chauffeur Makes the Horse and Coachman Seem Like Snails.

Many different phases of the superiority of the motor carriage over the horse drawn vehicle have been cited, but a Motor World man a few days ago witnessed the demonstration of one superior convenience that is valuable and yet is not generally mentioned, if indeed it has been pointed out at all.

This is the promptness and great saving in time afforded society people by using a motor car for calling, shopping, catching a train or for any sort of a trip. Men and women of leisure are often more pressed for time and impatient of delay than Wall Street operators. When they call by telephone to their stable to get a horse-drawn coupe or other vehicle, the usual formula is:

"How soon can you get the so-and-so coach and pair around to the house?"

More often than not there is some cause for a trifling but annoying delay. The horses are feeding, one is being shod, they have not been cleaned, or some other little thing hinders prompt service. At the best the horses must be given a superficial rub with a cloth and carefully harnessed in a way that causes a delay of from fifteen minutes to half an hour. When the owner has been suddenly called upon to go somewhere or has neglected to give due notice to the stable of his wants, this slight delay is a grievance. It involves being obliged to wait with bad grace anyway, and it sometimes involves being late in a way that is serious.

For the service of his automobile the formula of the private owner over the telephone is:

"Bring the car around right away."

This order results in the automobile being at the house inside of a few minutes. It is like sending a fire alarm and getting out the engines. This was splendidly illustrated quite in an everyday sort of way at the Barry & Hayes garage. The new Mercedes car of Frank J. Gould stood on the floor, and Mr. Gould's chauffeur, Harry H. Hill, was sitting at ease on the seat reading a newspaper. The car was shining like a sample at a show and the chauffeur was dressed in a new looking walking suit and a derby hat.

One of the employees of the place put his head out of the office door and nodded silently to Hill. The chauffeur exclaimed interrogatively: "For me?" An affirmative nod was the reply and before the head of the clerk had been withdrawn and the office door closed the chauffeur was out of the seat and on the floor in front of the car giving the crank a whirl. He had shed his coat as he leaped from the car. Two turns of the crank and the engine was going, in a few seconds more Hill was on the steering seat with his leather operator's coat on and the big vehicle was moving slowly toward the door. Passing the office the chauffeur tossed his tweed coat and derby hat to a man on one side of the car, while from the other side he received his leather head dress. Then the car glided out of the garage and whipped around the corner.

As the owner lived only two blocks from the storage place his car undoubtedly was in front of his house within two minutes from the time he had telephoned for it. It was out of the garage in less than one minute after the message was received. This was not any prearranged exhibition, but was due just to a chance call that came while visitors were present. One of those who witnessed it all exclaimed:

"Gee, whiz! That's service for you! Why it's just like being in an engine house when an alarm comes in."

Up Fort Lee With Five Passengers.

"Until a couple of weeks ago I was not quite so confident as I wanted to be about the new Searchmont car," remarked Gaston Plaintiff, who, during Manager Greene's illness is in charge of the Wanamaker automobile interests in this city. "It was not that I had any reason to think that it was not all right; I simply felt that until I gave one a thorough test there would be an unsettled feeling in my mind."

"Well, a couple of weeks ago I had the chance I was looking for. One of the cars came over, and I loaded it up with five people and started for Jersey. On the way to the Fort Lee ferry the car behaved splendidly, and I got well acquainted with it. As soon as we got across the river I headed her up Fort Lee hill, determined to see what she was capable of. Up she went, without a skip or a falter, the five people on board seeming to make no difference, and we reached the top almost as easily as if it had been only a slight grade.

"That settled it in my mind, and I am only waiting for the factory to make deliveries to begin an active campaign. We expect the first car next week, and after that they will come along in quantities. We have a number sold, and from the way the car is taking there will be no trouble to dispose of many more of them.

Demand for Small Horns.

Small horns, not more than six or eight inches in length, and with a two-inch bell, are making a good seller, according to a New York jobber. They retail for about $1.50 or $2. They are put on runabouts and second-hand cars, and are very serviceable. They give a short, sharp toot that can be heard for quite a distance.

Railroad Rates That Vary.

Some rare inconsistencies are found in the charges made by railroads for hauling automobiles as freight. A jewel of this sort was shown to a Motor World man the other day by a New York agent, who was charged three-fourths as much for one car as he was for three on invoices from the same factory.

WORKED WITH ONE PENNY

Little Trick in Starting That Caused the Visitor to Cheerfully Part With the Coin.

The days when one can put a penny in the slot and get an automobile have not yet arrived, but you can put a penny in the slot and make one run. This may not be news to old stagers in the electric vehicle business, but one man who thought he was well posted learned it only the other day in a way that impressed him with the notion that he had a narrow escape from being financially ruined.

He was in a garage uptown in New York city, not a hundred miles from the Automobile Club, and was conversing with the head of the firm when one of the employes entered the office and asked for a plug to fit a certain Columbia machine.

"You don't need one. Use a penny," replied the proprietor.

"Is that so?" remarked the visitor. "It's a new one on me. I've heard of a nail and a key and such things, but I never knew of a coin being used for a plug."

"Come here and I'll show you," remarked the proprietor, fumbling in his pocket as he led the way to a Columbia stanhope.

"Got a penny?" he queried suddenly.

The inquisitive visitor produced the coin and silently handed it over. The demonstrator wedged the penny crosswise, edge up, in the socket made for the plug, and readily started the car. Then he repeated the experiment successfully with another make of electric.

"That's worth knowing," remarked the proprietor of the establishment, and as the talk turned to other subjects he absentmindedly slid the borrowed penny into his pocket.

"Yes, that information was worth a cent," remarked the man as he left the store, "but holy smoke! I'm glad it didn't need a five-dollar gold piece to illustrate the trick."

Southworth now has two Stores.

By the acquisition of the garage at 10 Clinton street, Brooklyn, A. G. Southworth now has under his control establishments possessing a capacity for 300 cars. The Clinton street place, which has just been leased, has been operated by the Maltby Automobile and Motor Co., but will pass from them on April 1, when A. W. Blanchard will take charge as manager for Southworth. The latter will, of course, continue to operate the station at 342-344 Flatbush ave., and both it and the Clinton street place will carry a stock of Waverleys, Ramblers, Generals and Toledos, for which the exclusive agency is held.

It is now stated that it was one of the eight-cylinder C. G. & V. cars that C. M. Schwab recently ordered for his own use. It is to develop 80 horsepower.

The Farmer Wants his "Chane."

It usually is not pleasant to be reminded of the days of our trouble, but the reminder of one experience with a car in a ditch was found to be intensely amusing by Worthington Butts, of Buffalo, when it came in the form of the letter printed below.

From the earliest days of automobiling "Worthy" Butts, as he is familiarly known, has been a conspicuous traveller on the roads about Buffalo in his Packard. He owns a rare reputation as a daring operator, and many are the strange stunts and weird adventures in which that Packard car has participated.

One of his interesting excursions included an aerial dive from the roadway near Boston Centre into the bed of a creek, and the car rested there until a farmer hitched a chain and team of horses to it and hauled it forth to continue its wonderful career.

That was almost a year ago, and it was about forgotten by "Worthy" until he got this original note:

New Oregon, N. Y.

Dear Sir::—

Do you remembre the old man yet that helpt you out of the creek below Boston Center I am wisher fore my chain no dout but what you remember yet that you throd it on youer rick at last I found out youer name and found out wher I can call on you.

So Pleas take the chane ore els the money for it to Mrs. Blank 8444 Swan fore you cant ekspect me to loos the chane yet after I helpt you out of youer trouble but Pleas take it ther ride away fore I woll call for it first part of next weeke.

Yoners truly

Buyers not "Going it Blind."

"Any one who thinks that automobile buyers select at haphazard or without looking over the field are very much mistaken," remarked a salesman in a metropolitan establishment last week.

"They come in here cocked and primed about our cars as well as those of other dealers. They ask about different features and show considerable familiarity with them, even although they may never have owned or even driven one. Another thing that has impressed me is the way they read the automobile papers. It seems as if as soon as a man makes up his mind to buy an automobile he gets an automobile journal and posts himself on the subject. They will tell us about something that appeared in a certain paper or mention that their attention was directed to our car by seeing a description of it there. One man even took a copy of the Motor World out of his pocket so that he could compare a cut there with the car itself.

Homan & Schulz, of No. 134 West Thirty-eighth street, New York, have taken the agency for Locomobile gasolene touring cars. As they now handle the Northern runabouts, this will give them two choice lines to offer every class of customers.

Winton in Tiffany's Window.

Dr. Frank W. Brandow, of Pittsfield, Mass., who has revealed so much ingenuity in making miniature models of mechanical objects, recently completed a model of the 1903 Winton touring car that is considered such a jewel of artistic workmanship that it is being exhibited all this week in the window of Tiffany, the New York jeweler.

This is the second Winton automobile modeled by Dr. Brandow, as last year he reproduced a 1902 car in miniature. The new model is only eighteen inches in length and is exquisitely worked out in brass, silver plate and oxidized silver, with an upholstering of black kid. It has a clever reproduction of a Solar headlight lamp on it, and is, all told, a most perfect copy in diminutive of the Winton, which is selected by the Doctor as a representative American car.

Here's a Portable Jack.

In the Kenosha Auto-Jack, which is being marketed by the Badger Brass Co., Kenosha,

Wis., an article of exceptional merit is offered to motorists. It is moderately priced, of light weight and compact, so that it can be readily carried in the average tool box, yet sufficiently powerful to lift one and one-half tons. Closed, the jack is only 12 inches in height, and it raises to 18 inches, so that it will lift wheels 34 inches in diameter.

The Kenosha jack, a good idea of which is given by the cut, is constructed of the best grade of malleable iron, and is positive in action. It has a rack and pinion movement, the pinion being actuated by a worm, to which the operating handle, a box wrench, with cross handle, is applied. The jack can be instantly raised to limit of height by simply pulling up the rack. This throws the worm out of gear until the rack is dropped, when it falls into gear by its own weight. There are no springs, pawls or other small parts.

How Local Shows Help.

As instancing the value of some local shows, the experience of the Wanamaker establishment at the Philadelphia exhibition a few weeks ago is interesting. During the week fifty-seven retail orders for Cadillac cars were booked. As Manager Bunting of the Wanamaker store put it: "We shan't be able to get this number of cars, of course, but it is gratifying as indicating what can be done with a good car by pushing it properly."

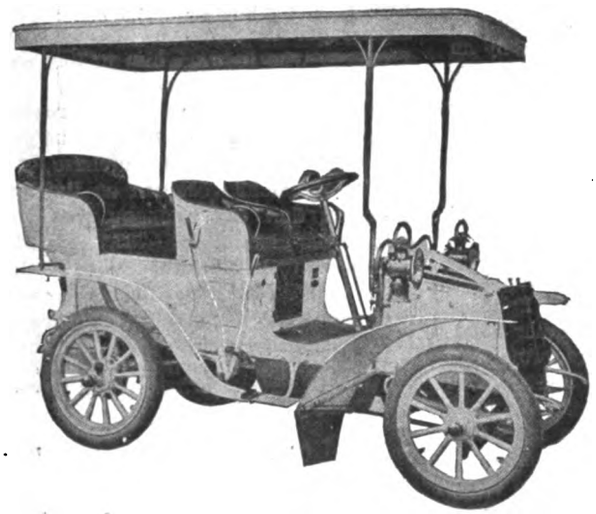
Features of Foreign Chain Trade.

"This foreign chain business is a queer one. Simplicity is the last thing to be found in it, as I have learned in the last few weeks." The speaker was Charles E. Miller, the well known jobber of this city, and he was pointing to a huge Brampton chain evidently made for a high powered car.

"You would hardly believe that there are seventy different chains for automobiles made by the Brampton people, but such is the case. They have entirely different chains for each of the foreign make of cars—Panhards, Mors, Daimlers, etc. Not only that, but there is a special chain for each type of car of these makes—different in both pitch and width. For an 8 horsepower car a chain of one size is used; for a 12 horsepower car a larger and stronger one; for a 16 or 24 horse a still stronger one. The lighter chain cannot be fitted to the heavy car, for the sprockets of the latter are cut differently.

"Another thing that is peculiar, and which gave us a great deal of trouble at first, is the Continental custom of using millimetre measurements. We had to reduce them to inches for catalogue purposes, and it was a big job."

Packard vs. Trolley Car.



From Panhard to Packard is but a slight change, as far as names go. But the transferral is a significant one in the case of the cars themselves. Such a transfer was made recently by R. A. Alger, jr., of Detroit, who purchased a Model F Packard in place of a 24 horsepower Panhard that he had previously used. It was not long after he became its possessor that the Packard was put to a severe test. It tried conclusions with a Detroit streetcar moving at speed, and when an account of stock was taken it was found that both showed the effects of the collision. The Packard car had the headlight and bonnet entirely demolished, and the body was bruised and cracked. The engine, however, was not disturbed in the least. It was driven to the garage under its own power, and beyond needing a new radiator was none the worse for its unusual experience.

Why Morses Have Been Delayed.

E. T. Kimball, of the Central Automobile Co., is awaiting the arrival of "January deliveries" of Mors cars that he bought while in Europe. Advices just received from France tell him that he will have some 11 horsepower cars by the end of the month, and some of the 18 horsepower early in April. The Mors factory at the time the letter to Mr. Kimball was written was just completing its "December deliveries." First a fire and then a strike among the factory hands have been the causes of this factory being so far behind in deliveries. One of the 18 horsepower Mors coming to the Central company has been sold to Clarence W. Mackay.

Duty on Lamp Lenses Stands.

Efforts to secure a reduction of import duties on lenses used in bicycle and automobile lamps have failed. The Board of Classification of the United States General Appraisers, sitting in this city, last week handed down a decision refusing to change the classification, as asked by the importers, Hammel, Riglander & Co.

The goods covered by the protest are lenses of glass, ground, assessed at 45 per cent ad valorem and 10 cents per dozen pairs, and claimed to be properly dutiable at the rate of 45 per cent ab valorem as "projecting lenses."

The question was passed upon by the board adversely to the government in an unpublished decision dated April 20, 1902. That decision was rendered, however, on only slight evidence, and the board has now passed upon the question on a very full and complete record.

The importers contended that the articles are not included within the provisions of paragraph 109, and pointed to the phrase "per dozen pairs" as showing that only spectacle lenses are included within this provision; and that even if the lenses be included within the provisions of this paragraph, they are more specifically provided for in paragraph 111 as projecting lenses.

The contention of the government was that the term "projecting lenses" in paragraph 111 refers only to mounted articles.

General Appraiser Fischer, who wrote the opinion for the Board of Classification, overruling the importers' contention, says in part:

"The claim of the importers that the lenses in question are not included within the provisions of paragraph 109 is answered by an inspection of the official samples, which show that they are lenses of glass, ground and polished to spherical form. This brings us to the second and main proposition—namely, as to whether the lenses are projecting lenses within the meaning of that term as used in paragraph 111.

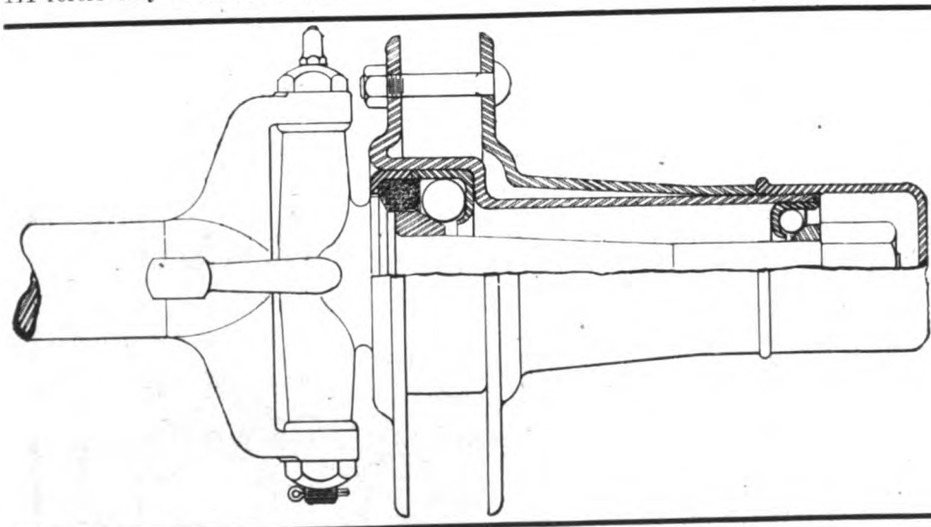
"At the hearing counsel for the importers endeavored to show that a projecting lens was a lens capable of projecting light or image. The government, on the other hand, endeavored to show that the term 'projecting lenses' was a commercial term, and covered only an instrument consisting of a number of lenses arrenged together in a mounting with decises for regulating the same.

"We think the language of the two paragraphs shows that the term 'projecting lens' in paragraph 111 does not relate to unmounted lenses, and that it was used to mean a mounted combination of lenses, for otherwise either that provision or the provision in paragraph 109 would have no effect.

"Furthermore, as showing the intent of Congress, it should be noted that the articles provided for in paragraph 111, with the exception of projecting lenses, are mounted articles in the nature of optical instruments."

'Frisco Concern in Court.

The affairs of the Universal Automobile Co., of San Francisco, Cal., are being aired in the police court of that city. R. B. Easley, a stockholder, claims that he was fleeced out of $3,000 by Manager W. J. Woolsey, who induced him to buy stock in the concern to that amount.

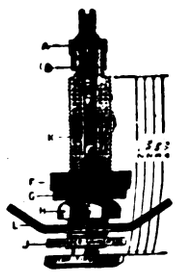


Easley claims that he was approached by Woolsey on December 10 last and induced to invest $3,000 in the purchase of stock in the automobile concern on the former's assertion that the company was indebted only to the amount of $1,200. Subsequently he sought to look at the books of the concern, but Woolsey declined to grant him that privilege. On making inquiries among certain stockholders he made the discovery that the company was involved to an amount greatly in excess of the sum represented by Woolsey.

Van Alstyne Building in Rochester.

An up-to-date garage is being erected for A. W. Van Alstyne, Rochester, N. Y., and is expected to be ready for occupancy by April 1. The building will be of brick, two stories high, 40 by 100 feet, and capable of storing one hundred and fifty automobiles.

The Week's Exports.



Havre—1 case motor vehicles, $208.
Liverpool—2 cases motor vehicles, $2,800.
London—22 cases motor vehicles and material, $9,632.
Lisbon—3 cases motor vehicles, $3,830.

THESE HUBS are drawn from Sheet Steel.
Extremely light and strong Hubs with a smooth surface for finish are obtained.
Center line of Spokes is close to Steering Head. Smooth and Easy Steering is obtained.
Races are GROUND IN POSITION.
Cones and Cone Seats on Spindles are GROUND TO GAUGE.
We manufacture for the trade only.

WE HAVE CONSTANTLY ON HAND CHOICE BARGAINS IN SECOND-HAND MACHINES

A full line of standard French and American accessories carried in stock.

STATE YOUR REQUIREMENTS. WE CAN MEET THEM, IF ANYBODY CAN.

The Beginning of the 'Bus.

One must go back to 1661 for the natal year of the omnibus. As the present name implies, this vehicle was intended for the use of all who desired to make trial of it, although neither the name nor the use belonged to it originally.

The famous mathematician, Blaise Pascal, is said to have introduced the important vehicle which is called the omnibus. Unlike most other men of learning, Pascal was more or less interested in the affairs of practical life. He was the inventor of the pushcart that now perambulates the streets.

In 1661 he had large wagons built for regular traffic in the heart of Paris. He allied himself in this undertaking with several influential friends, among whom was the Duke de Roannes.

In 1662 Louis XIV granted letters patent to Pascal, in which it was said that these carriages were intended for the comfort of poor people who had to go to courts of justice or who were sick and so poor that they could not afford to pay the two pistoles exacted by the chairmen and the drivers of coaches.

At first the use of the vehicle was not generally permitted. A royal decree forbade its use by s ldiers, pages, lackeys and other salaried servants, as well as artisans and porte s.

Pascal, in spite of the fact that he only lived to be thirty-nine, is said to have made no inconsiderable sum out of his invention. After the venicle had been in use for some sixteen years it was abandoned for various reasons. It was not until 1812 that it was again introduced, this time in Bordeaux, which city was followed, in 1821, by Nantes and in 1827 by Paris. The vehicle was improved, and rapidly became popular. In modern times the vehicle was called an omnibus simply for the reason that it was intended for the carriage of all, without any restrictions as to lackeys, pages or footmen.

Figures Proving Value of Good Roads.

To show the necessity of better roads a well-known engineer has estimated the cost of transporting goods over the highways. He figures that the cost of moving one ton by horse power over one mile of dry sandy road is 62 cents; over wet sand, 32 cents; over ruts and mud, 39 cents: over broken stones and ruts, 26 cents; over an earth road that is dry and hard, 18 cents; over a broken stone road that is in good condition, 8 cents; over stone paving, 5.33 cents; over asphalt, 2.7 cents. It may be argued that millions of dollars would be saved, and many tons of merchandise would be available in the markets, if the roads were such that transportation by wagon would cost not more than 5 cents a mile.

"IT STARTS FROM THE SEAT."

The Week's Patents.

722,122. Device for Throwing Motors Into Gear. Ludwig Maurer, Nuremberg, Germany, assignor to Nürnberger Motorfahrzenge Fabrik "Union" G. M. B. H., Nuremberg, Bavaria, Germany. Filed May 15, 1902. Serial No. 107,445. (No model.)

Claim.—In a device for throwing motor-shafts into and out of gear in motor-vehicles and the like, the combination with suitable supporting-bearings, of a motor-shaft journalled therein, having an elongated crank portion and having limited endwise movement, a pitman connected to said crank to have sliding movement thereon, a friction-disk carried on the end of said shaft, a lever for moving said shaft longitudinally, and a friction-wheel adjacent to said friction-disk and adapted to be engaged and disengaged by the movement of the shaft and disk, substantially as described.

722,116. Motor-Propelled Vehicle. Frederick W. Lanchester, Birmingham, England. Filed July 12, 1902. Serial No. 115,357. (No model.)

Claim.—1. In a motor-propelled vehicle, the combination with a prime mover, of an engine capable of acting either as an elastic-fluid compressor or a motor, a reservoir for the fluid, and changeable connections whereby said engine may be caused to store fluid in said reservoir, or the stored fluid may be used to drive said engine, a cooler for cooling the air delivered to the reservoir, and a heater for heating the air delivered from the reservoir to the engine, substantially as described.

722,458. Speed changing and reversing mechanism. Allan C. Sargent, Graniteville, Mass. Filed Nov. 21, 1902. Serial No. 132,-212. (No model.)

Claim.—1. A speed varying and reversing mechanism, comprising a central shaft, a pair of gears fixed thereon, sleeves revoluble on the said shaft at opposite sides of said pair of gears, a gear at the inner end of each sleeve, a casing, two pairs of planetary gears carried by the said casing, each pair meshing with one of the said fixed gears and with the gear on one of the sleeves, means whereby the respective sleeves may be locked from rotation, and a clutch co-operating with said casing and one of said sleeves, whereby the casing and said sleeve may be locked together, substantially as described.

722,459. Tire for vehicles. Oscar Schaefer, London, England. Filed Nov. 19, 1901. Renewed Jan. 13, 1903. Serial No. 138,830. (No model.)

Claim.—1. The herein described process of making a vehicle tire, which consists in applying a layer of unvulcanized rubber to a suitable core or mandrel in the form of a closed ring, braiding upon said layer a plurality of threads in open mesh, said threads being all equally disposed and laid on simultaneously and under a strong and uniform tension at all parts, applying a layer of unvulcanized rubber upon said layer of braiding, continuing said braiding and the application of said layer of rubber until the same overlap the inner end or beginning, cutting off said braided layer or the threads composing the same at a point beyond said inner end, applying a final covering layer of unvulcanized rubber over the mass, and vulcanizing the whole, substantially as set forth.

722,466. Steam generator. John W. Sutton, New York, N. Y. Filed Aug. 20, 1902. Serial No. 120,327. (No model.)

Claim.—1. A steam generator for automobiles, consisting of an exterior double walled shell having a rounded off top part or dome and tiers of superposed groups of coils, each group consisting of intermediate and side coils arranged adjacent to each other in said shell, the terminals of the coils of each group passing through the inner wall of the shell and communicating with the water space of the generator, and the coils having a rising inclination from the lower to the upper terminals, substantially as set forth.

722,532. Speed indicator for vehicles. Alden L. McMurtry, New York, N. Y. Filed Oct. 3, 1902. Serial No. 125,814. (No model.)

Claim.—1. A vehicle speed indicator comprising the combination of a part actuated relatively to the speed at which the vehicle is travelling, an indicating device associated therewith showing a definite distance traversed, and a stop watch or timepiece, automatically set into operation and automatically arrested by the speed indicator actuating mechanism, and having the usual indicating devices and which shows the time occupied in traversing such definite distance.

722,544. Combined exhaust valve and igniter. Joseph Tracy, New York, N. Y. Filed Oct. 21, 1902. Serial No. 128,130. (No model.)

Claim.—1. A combustion engine exhaust valve, having a longitudinal bore in its stem forming an igniting chamber opening into the combustion chamber.

722,567. Exhaust silencer. Middleton Crawford, London, England, assignor to Silent Motor Car Syndicate, Limited, London, England. Filed Dec. 3, 1901. Serial No. 84,569. (No model.)

Claim.—1. In an exhaust silencer, the combination of an expansion chamber, a conduit between the chamber and the engine cylinder, a series of concentric compartments through which the gases pass successively from the expansion chamber to the atmosphere, and a non-return valve placed between the expansion chamber and the compartments, substantially as set forth.

722,587. Alarm for vehicles. Joseph M. Justen, Toledo, Ohio, assignor of two-fifths to George W. Birchall and Charles R. Clapp, Toledo, Ohio. Filed Sept. 25, 1902. Serial No. 124,856. (No model.)

Claim.—1. An apparatus of the class described, comprising a bracket or frame designed to be mounted on a vehicle, a transverse shaft mounted in the bracket or frame and capable of a limited oscillatory movement, gearing connecting the transverse shaft with one of the wheels and adapted to be separated by the oscillatory movement of the said shaft, a counter shaft mounted in the frame or bracket, gearing connecting the said shafts, means carried by the counter shaft for striking a gong, and spring actuated operating mechanism connected with the transverse shaft and normally holding the same out of operation, substantially as described.

722,600. Pneumatic tire. Edwin Midgley, London, England. Filed May 9, 1902. Serial No. 106,641. (No model.)

Claim.—1. A pneumatic tire comprising in its construction a rubber tread portion, and a strip of links loosely connected together and embedded in said tread portion so as to be engaged and entirely surrounded by the rubber forming the tread portion.

722,606. Electrical contact brush and method of producing same. Homer N. Motsinger, Pendleton, Ind., assignor to Motsinger Device Manufacturing Company, Pendleton, Ind., a corporation of Indiana. Filed Aug. 25, 1902. Serial No. 120,928. (No model.)

Claim.—1. A contact brush consisting of a central core of carbon, and an external wrapping of metallic gauze, the edges of which are brought together and connected by solder.

722,611. Vehicle body. Harry McLoughlin, Stapleton, N. Y., assignor to Barton E. Kingman, New York, N. Y. Filed Aug. 9, 1902. Serial No. 119,109. (No model.)

Claim.—1. A vehicle body comprising a tubular metallic frame, rivet strips rigidly attached to said frame and comprising strips of metal having struck up therefrom integral tubular rivets, and metallic panels having perforated edges fitted over said rivets, the projecting ends of the rivets being expanded to clamp the panels to the rivet strips, substantially as described.

722,612. Tire for wheels of road vehicles. Berne Nadall, Kingston-upon-Thames, England. Filed July 22, 1902. Serial No. 116,-583. (No model.)

Claim.—1. The combination of a wheel rim, a metallic spring corrugated in the direction of its length to form a rib, a tire adapted to fit over said rib, side pieces or flanges attached to said rim, and bolts passing through said side pieces and through the lower portions of said tire and said rib, substantially as described.

722,629. Internal combustion engine. Carl C. Riotte and Carlton R. Radcliffe, New York, N. Y., assignors, by mesne assignments, to United States Long Distance Automobile Company, Jersey City, N. J., a corporation of New Jersey. Filed Sept. 11, 1902. Serial No. 122,913. (No model.)

Claim.—1. In a hydrocarbon engine, a cylinder, a combustion chamber therein, a piston therein, a pressure reservoir having a pressure therein in excess of the highest working pressure, an air inlet, said piston acting to compress air in said cylinder, an exhaust valve and means for forcing a combustible mixture into the space above the piston against air pressure and a rising working pressure therein, said air pressure being below the point of ignition, and means for igniting.

722,671. Gas Engine. Leopold F. Burger, Anderson, Ind., assignor to Woolley Foundry and Machine Works, Anderson, Ind. Filed October 21, 1901. Serial No. 79,374. (No model.)

Claim—1. In a gas engine a governing valve casing, provided with independently movable air and fuel valves having concentric stems slidingly mounted on each other disconnected from each other when seated, and shiftable means carried by one valve stem for automatically engaging the other valve stem and thus connecting said valves to operate in unison; substantially as specified.

722,672. Valve for Gas Engines. Leopold F. Burger, Anderson, Ind,. assignor to Woolley Foundry and Machine Works, Anderson, Ind. Filed November 11, 1901. Serial No. 82,070. (No model.)

Claim—1. In a gas engine, a valve casing comprising a mixing chamber, an air valve at one end of said chamber provided with a stem extending therethrough, a fuel valve and casing located within said chamber, a push plate slidingly mounted upon said stem within the mixing chamber, for operating

Digitized by Google

said fuel valve, and means for connecting said plate to said stem; substantially as specified.

722,697. Friction Clutch. Charles R. Greuter, Holyoke, Mass. Filed June 30, 1902. Serial No. 113,863. (No model.)

Claim—1. In a friction clutch the combination with a rotatable shaft, of a driven clutch member loose on the shaft, a driving clutch member rotatable with said shaft for frictionally engaging said driven member, a radially-movable support for the driving member of the clutch on which the latter may also swing in the plane of its rotation, and means on the shaft to hold said driving member normally concentric to the shaft.

722,723. Steering Gear for Motor Vehicles. Frederick Lamplough, Willesden, London, England. Filed April 16, 1902. Serial No. 103,106. (No model.)

Claim—1. In steering gear the combination with a right and left hand screw-threaded spindle, a divided nut and means for transmitting the movement of the nut to the steering wheel or wheels; of a casing inclosing said divided nut, and of means for adjusting the position of the spindle and nut in said casing, for the purpose specified.

722,787. Gas Engine. George Westinghouse and Edwin Ruud, Pittsburg, assignors to the Westinghouse Machine Company, a Corporation of Pennsylvania. Filed March 31, 1898. Serial No. 75,891. (No model.)

Claim—1. In an internal combustion engine, a hollow exhaust valve having one or more ports in its shell through which the cooling fluid that is supplied to the interior of the valve is discharged into the exhaust passage.

722,838. Method of Feeding Water to Steam Boilers. Samuel M. Guss, Reading, Pa. Filed October 20, 1902. Serial No. 127,917. (No model.)

Claim—1. The improved method of feeding water to a steam boiler by the combined actions of a force pump and an injector which consists in operating said injector with a flow of steam in excess of the amount condensed by the water supplied thereto, and injecting the jet therefrom into an independently forced stream of low temperature feed water moving in the same direction, the momentum of said low temperature stream co-operating with that of the injected stream and the entrained steam in the latter serving to raise the temperature of the combined streams to approximately boiling point.

722,846. Cylinder for Explosive Engines. Lawrence M. Johnston, Dayton, Ohio. Filed June 5, 1899. Serial No. 719,510. (No model.)

Claim—1. The combination with the cylinder proper having one end open and its other end closed by a solid integral head, a removable part or plate inserted centrally in said head, a water jacket on the cylinder and terminating at or near its closed end, and a cap entirely inclosing the end of the cylinder and its removable part and removably bolted to the end of the water jacket.

722,913. Electric Ignition Device. Nikolaus Schmitt and Johann Krannichfeldt, Cologne, Germany. Filed February 25, 1902. Serial No. 95,623. (No model.)

Claim—1. An electric ignition device comprising in combination a short, thin, flat and flexible strip of non-conductive material; short, thin, flat and flexible strips of conductive material disposed at a short distance apart, on one and the same surface of, and carried by, said non-conductive strip; a mass of combustible material provided between, and in contact with, said two conductive strips, and means to assist the passage of the electricity from one conductive strip to the other through said conbustible mass; substantially as set forth.

722,916. Motor Vehicle. Gordon J. Scott, Philadelphia, Pa., assignor to Charles H. Graham and George D. Bouton, Philadelphia, Pa. Filed May 16, 1902. Serial No. 107,572. (No model.)

Claim—1. In a motor vehicle the combination with the carrying wheels, of an electric motor having a plurality of armatures arranged in a circle at right angles to the axes of rotation of said armatures, field magnets forming a magnetic circuit common to the plurality of armatures, and gearing between said armatures and carrying wheels.

722,930. Brake Applicable to Motor Cars, Other Railway Vehicles and Revolving Shafts Generally. Edwin Wadey, Los Angeles, Cal. Filed June 11, 1900. Serial No. 19,976. (No model.)

Claim—1. The brake for retarding or arresting the motion of rotating bodies such as the wheels of railway cars or vehicles consisting of independently suspended brake blocks, that is to say, without brake beams in connection therewith as commonly employed, said brake blocks being independently suspended in pairs, two for each wheel, the brake blocks being at diametrically opposite parts of said wheels, a lever moving in a vertical plane operating in connection with one of the brake blocks of each pair of brake blocks, said suspended brake blocks being connected together in pairs, two for each wheel, by adjustable coupling links extending from the suspension centre of one of the brake blocks to the lower arm of the lever moving in a vertical plane in connection with the other brake block and operated by tension upon the upper arm of the aforesaid lever or levers, according to the number of pairs of brake blocks employed, in the manner and for the purposes, substantially as hereinbefore described.

722,987. Initial Heating Device for Hydrocarbon Burners. William R. Jeavons, Cleveland, Ohio. Filed March 6, 1902. Serial No. 96,886. (No model.)

Claim—1. An initial heating device for hydrocarbon burners having a non-combustible body with crevices at its side to conduct oil to the top thereof, and provided with a frayed-out bushy top edge, thus providing interstices to form a reservoir for oil, substantially as described.

722,988. Lighting Device for Hydrocarbon Burners. William R. Jeavons, Cleveland, Ohio. Original application filed March 8, 1898. Serial No. 673,045. Divided and this application filed December 22, 1902. Serial No. 136,145. (No model.)

Claim—1. In a lighting device for hydrocarbon burners, a corrugated support, and a strip of asbestos laid around one side of said support, substantially as described.

723,052. Collapsible Piston Valve. William G. Sinnamons, Syracuse, N. Y. Filed November 15, 1902. Serial No. 131,559. (No model.)

Claim—1. A piston valve formed of diametrically collapsible halves, and means for restraining said halves from expanding beyond a fixed diametral limit, substantially as specified.

723,057. Method of Manufacturing Pneumatic Tires. Uzziel P. Smith, Chicago, Ill., assignor to Frank A. Sieberling, Akron, Ohio. Filed December 10, 1902. Serial No. 134,688. (No model.)

Claim—1. The method of manufacturing pneumatic tires which consists in separating two layers thereof by a fugitive material, and one which will prevent the separated layers from uniting during the vulcanizing operation, and then vulcanizing the tire.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

FOR bargains in used automobiles but as good as new, address C. A. COEY & CO., 5311 Cottage Grove Ave., Chicago, Ill.

FOR SALE CHEAP.—Thomas Tonneau Touring Car. New; fine condition. A bargain. T. SHEROW, Millbrook, N. Y.

FOR SALE—Conrad Steam Surrey, in A1 condition, at a bargain; has all extras that money can buy excepting a condenser; three seats. Will send photo. Also, 1 Locomobile Runabout. ROTH'S AUTOMOBILE CO., Lancaster, Pa.

FOR SALE—Three-wheeled Knox with top, in good running order, $300.00.
Address Box 682, New Haven, Conn.

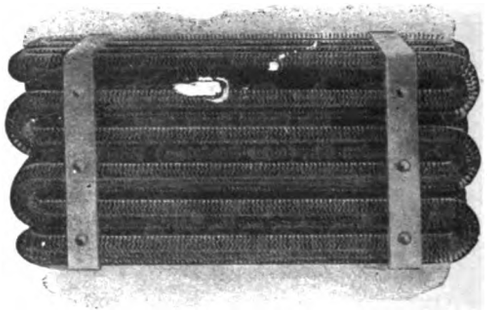
SEND five cents for our illustrated catalogue of second-hand automobiles. Big variety, low figures. MISSISSIPPI VALLEY AUTOMOBILE CO., 3927-3939 Olive St., St. Louis, Mo.

ONE 15 horse power Steam Touring Car; will seat four people with ease; a very powerful machine; body is similar to a surrey; handsome in appearance; finished in black and red; a car that is built strictly for business; guaranteed in perfect condition; equipped with Goodrich clincher tires, and is equal to any $1800 car on the market; must be sold at once for $475; car is just one year old. JOHN H. HIDLEY, 417 River St., Troy, N. Y.

AUTOMOBILES FOR SALE.—1 Winton touring car. 1902. Just out of paint shop. Machinery in first-class condition. Large Solar headlight, 2 extra tires, extra repair parts, etc. 1 Haynes-Apperson Phaeton, 1901. Just overhauled and painted. All in first-class condition. 1 Locomobile, 1902 model. Special basket seat Steam air pump, hamper, auxiliary gasolene tank, Gray & Davis headlight and other extras. All above machines must be sold by April 1st. Best offer takes them. FRANKLIN WESTON, Dalton, Mass.

SITUATION WANTED—On the Dashboard of your automobile. Am fully competent to keep machine perfectly lubricated without any attention on the part of my employer. Have splendid record, and references. Never known to give trouble. My present employment is pretty general, but I desire to make it universal. Compensation very moderate. Address MULTIPLEX, care of The Automatic Lubricator Co., 1138 Caxton Building, Chicago.

PRINTED LISTS, each containing 2000 names and addresses, 1000 of which are automobile owners, and 1000 parties who contemplate the purchase of automobiles, parts, motors or accessories. Sold under a positive guarantee, $5. Digest of gasolene engine patent records, $1. Castings for 5 h. p. automobile Gasolene engine including those for float feed carburetter, $17 per set. (No personal checks). S. M. HOWELL, Mechanical Engineer, 194 N. 4th Street, Columbus, Ohio.



FOR SALE—Steam Touring and Racing Car, French type, with detachable rear seat, equipped with automatic air pressure, water pump, low water alarm, steam whistle and French horn. Was built to order, July, 1902. Cost to complete about $1,700.00. Not been run 200 miles. Will sell for $950.00. Owner going to Europe. Car can be seen and tried by calling. If interested, send for photograph of car. Post Box, 448 Harrisburg, Penn.

FOR SALE—Automobile runabout. Make, Milwaukee; in good running order; little used; tires never punctured. Address, B. F. ALMY, Jr., Box, 61, Providence, R. I.

FOR SALE—Champion Clutch, never used. Apple Igniter, nearly new. NATIONAL AUTOMOBILE & MOTOR CO., Milwaukee.

FOR SALE—3½ H. P. De Dion Motor & Muffler, $125. CONNOLLY, 51 Mount Pleasant Avenue, Boston.

Columbia AUTOMOBILES

NEW MODELS FOR 1903.

LIGHT ELECTRIC RUNABOUT MARK XXXVIII.

One of the Sensations of the Season.

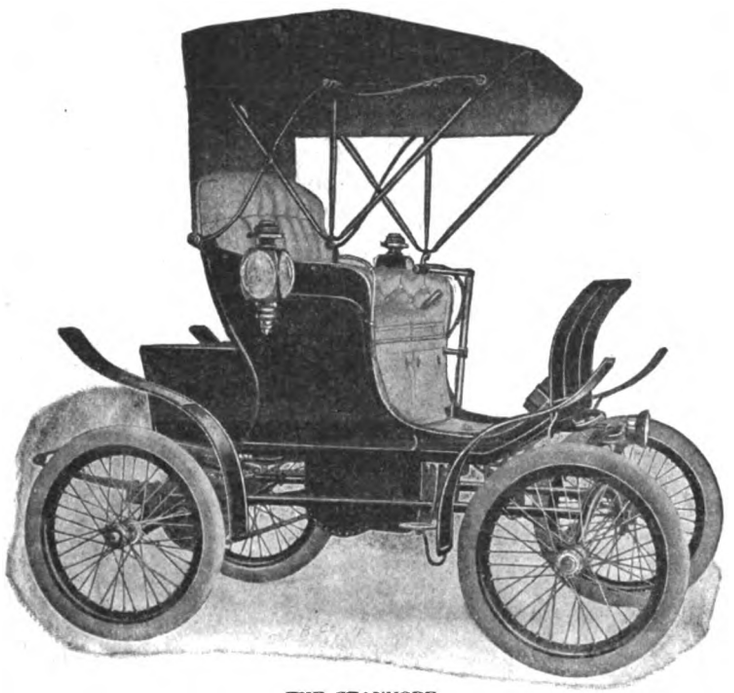
Entire Body Space Available for Luggage.

Lightest Electric Automobile of equal mileage ever made. Weight including battery 1000 pounds. Underslung battery and motor. Low center of gravity gives great steadiness and easy running qualities. Reachless Running Gear. Flexible Side Springs. Three-point body suspension obviating all warping and twisting strains over rough road surfaces. Five speeds. Maximum speed fifteen miles per hour. Two brakes. Electrical brake operated by controller handle. Mechanical brake operated by foot lever. Foot brake locking device shuts off current so that power cannot be applied until brake is released.

PRICE $900.00.

The COLUMBIA Line for 1903 also includes the following new vehicles:

24 H. P. GASOLENE TOURING CAR, COLUMBIA REAR-DRIVEN COUPE, COLUMBIA INSIDE OPERATED COUPE, COLUMBIA SPECIAL SERVICE WAGON, DELIVERY WAGONS and TRUCKS.



Columbia "Seabright" Runabouts, Victorias, Surreys, Tonneaus, Cabriolets, Opera Busses and Broughams which were so unqualifedly successful during 1902, have been perpetuated with numerous improvements. Catalog sent on repuest.

ELECTRIC VEHICLE COMPANY, Hartford, Conn.

Cleanliness is Next to Godliness

APPLIES WITH AS MUCH FORCE TO THE CONDITION OF THE TOOL BOX AS TO ANYTHING ELSE.

Our Nickel-plated, "Copperized" and Nickel-plated automobile oilers don't leak or permit the oil to ooze out, are compact and shaped so that they reach every oil hole in the car; can be carried conveniently and are altogether indispensable to every automobilist. Incidentally one of them will carry gasolene enough to run a vehicle about ten miles.

Lamps and Engineers' Sets.
Drop Forging, Sheet Steel Stamping, Etc.

IMPORTED

Motor Goggles

We have just received a large shipment of European Goggles for automobile and motor cycle use.

We are United States representatives for the manufacturers. Our prices are the lowest ever quoted in this country.

We are also sole American agents for the celebrated **BRAMPTON CHAINS,** made from self-hardening steel. Sizes in stock to fit the Panhard and other European motor cars.

CATALOG MAILED ON REQUEST.
